each task performed by hamals as part of their work. Secondly, the organisation established itself as a mediator between traders and hamals. The panchayats insisted that traders' association in respective markets sign a three-year contract with them regarding payments to the workers. It was decided that any person willing to work as hamal should register himself with the panchayat. Thus the process of recruitment to the labour market was more or less monopolised by the panchayat till 1975. It helped in relieving hamals of their feudal bondages with traders. The panchayat emerged as a platform for collective bargaining of payments. The panchayat organised its first successful strike in 1968 in which more than 3,000 hamals participated. The agitations culminated in a contract signed between the panchayat and the 'Poona Merchant's Chamber'. The contract resulted in 15 rules and regulations for load carrying work and fixed rates for as many as 46 different tasks performed by hamals. Such contracts became a regular feature of the work of the panchayat. Still even after 25 years of unionism the panchayat has to agitate against the traders' associations in various market places over the details of the contract.

The panchayat not only pushed forward the economic demands of hamals but also insisted upon having proper and healthy conditions of work, arrangements of safety and security as part of the contracts. Since 1985 the panchayat has insisted on implementation of workmen's compensation act (1983) in cases of accident. These practices helped in establishing the identity of hamals as workers and in regularising employer-employee relations besides fulfilling their economic demands.

THE MATHADI ACT

The most significant accomplishment of the panchayat during the initial period was creation and implementation of Maharashtra Mathadi Hamal and other Manual Workers (Regulation of Employment and Welfare) Act (hereafter Mathadi Act). The act was passed by the government of Maharashtra in 1969 and was implemented partially only in 1980 due to legal action against its implementation initiated by the traders. The act is considered to be greatly beneficial to workers in informal sector and was seen as one of the radical measures undertaken by the state in fulfilling its welfare responsibility.

ties. The Hamal Panchayat along with the Mathadi Kamgar Union of Mumbai played an active role in realisation of the act. The Hamal Panchayat had always insisted on providing economic and social security to hamals and other manual workers. The Mathadi Act was an attempt to make the state play an active role in providing such security to the workers.

Manual workers in informal sector especially in the service sector could not get protection under existing labour laws due to lack of a definite pattern of employer-employee relations in their occupations. Organisations of these workers suggested that the state itself can mediate in evolving such a pattern of relations. The government of Maharashtra appointed a number of committees to look into the issue [Deshpande 1989:70-72]. The committees suggested a separate law for the workers in the informal sector rather than amending the definitions of employer and employee in existing labour laws. Accordingly the Mathadi Act provides for the establishment of tripartite district level boards (mathadi mandals) consisting of representatives of employers (traders), workers and the state. An apex body Maharashtra Rajya Hamal Mapadi Mahamandal, was created to supervise and control the work of the district level boards. Its chairperson was to be appointed by the government. Both traders and workers have to register themselves with the mathadi mandals. Thus the labour market is regularised and controlled. Registered hamals deposit their payments with the mandal. Traders contribute some amount (a maximum of 50 per cent of the payments) to this as a provision for future economic security for hamals.⁴ This is known as 'levy'. It is in this sense that the Mathadi Act looks after the future welfare of hamals and makes them liable for minimum benefits of a definite employer-employee relations. Actually, the act does not establish a definite employer-employee relation between traders and hamals but it compels the traders to accept responsibility for the workers' economic security and welfare.

Though good in its intentions; the act has proved to be inadequate on several grounds. Firstly, rates of payment to hamals vary from market to market because they are locally decided. Similar is the situation with regards to the amount of levy. The act specifies the maximum limit of levy to be deposited by traders (at 50 per cent of wages) but not the minimum. As a result

traders' associations have succeeded in keeping the amount of levy to its minimum in a number of markets. Thirdly since 1980 onwards since the act was implemented step by step and thus even at present a large section of hamals and mathadis do not get protection of the act. It is estimated that out of the five lakh hamal-mathadis working in the state only one and a half lakh are benefited by the act. Fourthly, even though minimum economic security is guaranteed to the hamals under this act mathadi mandals have not stood up to their expectations as mediators between traders and hamals. They are reduced to wage distributing agencies and fail to make any positive intervention in the market on behalf of the hamals.

More importantly, local mathadi mandals have emerged as new centres of power with huge economic resources with them in the form of wages of hamals and the levy. Dominant political interests operating at both state and local level started manipulating the mandals for their own purposes. The act provides for appointment of state's representatives on the mandals. This gave rise to a new system of political patronage. It led to politicisation of the workers' organisations as workers' representatives played a crucial role in managing the mathadi mandals [*Hamal Mapadi Varta*, special issue 1995:78-79]. The Congress Party in Maharashtra almost exclusively dominated the overall political process in the state till 1995. The Congress tried to appropriate mathadi mandals in various ways as it did in the co-operative movement. As stated earlier the hamals mainly come from poor maratha families and marathas have always supported the Congress in the state [Vora and Palshikar 1996]. These linkages made it easy for the Congress to appropriate mathadi mandals and patronise hamals. The politicisation of mathadi mandals made the politics of hamals more vulnerable in character. The Hamal Panchayat also had to participate in more open political contests due to the political overtones attached to the work of mathadi mandals.

The Mathadi Act held a number of implications for the mobilisational work of the panchayat. Throughout the last two decades the panchayat has been demanding a more effective implementation of the act not only to markets in Pune, but other parts of the state also. It has led to expansion of the work of panchayat to other markets places. At the moment the Hamal

Panchayat has its branches in more than 70 markets throughout the state. The conditions of work for hamals are decided locally under the Mathadi Act. Thus increase in wages and levy can be sought only by strengthening the organisation and increasing the collective bargaining power. Under these circumstances panchayat with its strong support base could establish itself as the most successful organisation of the hamals at the state level. Hamals were convinced that benefits of the act could be acquired only with the help of mobilisational strength as a result of which the panchayat grew. At present the panchayat works in more than a hundred markets all over the state. Secondly, Baba Adhav has been the chairperson of the apex body of the mathadi mandals since its inception in 1981. This helped the panchayat in expanding its organisational base. Taking advantage of its strong position the panchayat continuously persuaded the state to work for the welfare of the hamals. It not only agitated for effective implementation of elaborate suggestions about the welfare of the hamals. Its proposed a welfare scheme for the women hamals in Pune markets can be cited as a case in point.

There are very few women working as hamals. In fact most of them do not work as hamals in the strict sense of the term. These women, especially those working in grain markets, work as sweepers of the shops/godowns. Their main task is to sort out grains from waste. They do not get wages but a small part of grains that they salvage from waste. The custom is known as 'matere' (literally, 'mixed with soil'). In 1988, the panchayat suggested a welfare scheme for these women workers to be operated at the local level. The scheme worked out details for expansion of the Mathadi Act to cover these women workers [*Hamal Mapadi Varta*, special issue 1997:61-63]. Though the scheme is not implemented as yet it indicates the organisation's approach towards the welfare of hamals. The panchayat has continuously worked to appropriate the positive potentials of the Mathadi Act. Besides, it also attempted to compensate for the inadequacies of the act through its mobilisational strength. More than anything else it established the fact that organisational strength is the only weapon available to informal sector labourers to make the state work for them. In concrete terms the Mathadi Act has immediately benefited the hamals in enhancing wage

rates. But more importantly the act has helped them in asserting their mobilisational strength. The realisation of the Mathadi Act and compulsions inherent prompting the state to undertake its welfare responsibilities must be seen as significant achievements of the panchayat.

S111-HELP INFRASTRUCTURE

The same organisational strength was also used by the panchayat for extending social and economic security to its members independently of the state. These welfare programmes have been doubly significant for the hamals and the organisation. An analysis of these schemes actually touches upon some crucial questions related to the mobilisational strategies for the informal sector.

Initially, the panchayat started a co-operative of hamals, the Hamal Mazoor Sahakari Sanstha, in 1966. This co-operative was multifunctional in character. The Hamal Panchayat being a trade union, could not accept government contracts for load carrying work. Therefore the co-operative could work to recruit the hamals in labour market. It was expected to minimise the influence of private contractors and mediators in the labour market. Besides, the co-operative undertook various tasks related to load carrying work on a collective basis. The co-operative split in 1979 when around 1,500 members joined a co-operative started by a rival organisation, led by the Congress Party [Deshpande 1989:12]. This seems to be the only incident of a split in the organisation. Later the co-operative was resurrected by way of a co-operative store for the hamals. Of course services of the store were not limited to the hamals but all poor people. The Hamal Panchayat and its allied organisations have always demanded that there be 13 essential commodities fulfilling basic needs. These must be made available at the fair price ration shops run by the government [Adhav 1987]. The co-operative store was seen as an independent effort to realise the demand. The co-operative store has been a great success. Its annual turnover was around Rs 20 lakh during 1997-98.

After establishing its hold in Pune, the panchayat started some other ventures for welfare of the hamals, around 1975. The first was 'bhaubhet' (a brother's gift), and the other is 'pustakpedhi' (book bank). The panchayat started collecting a meagre amount of Rs 5 from its members in

addition to their annual membership fees. The amount collected is used for the above mentioned schemes. Under bhaubhet help is extended to family members of deceased hamals. Efforts are also made to accommodate at least one member of the family, especially the widow in the work of the panchayat. Bhaubhet serves the purpose for which the Workers' Compensation Act is executed by the state. Pustakpedhi or the book bank supplies textbooks to the children of the hamals, which they are expected to return after use.

Apart from these measures for temporary and incidental help the panchayat started building up its own welfare infrastructure. Initially, the panchayat's own clinic for hamals was started. Hamals were expected to pay minimum required charges for their treatment. Hamals are prone to accidents because of the nature of their work. Similarly they work in hazardous conditions during loading and unloading of commodities like cement, chillies, chemicals, etc. It leads to serious health problems. Thus a clinic operating at reasonable charges was felt to be an important necessity. It is significant that the clinic is self-sufficient and even pays an honorarium to the doctors offering services there. The panchayat did not receive any grants from outside agencies for the clinic. Secondly, the clinic did not restrict itself to medical treatment but also organised health awareness campaigns for the hamals. One of the surveys of hamals it revealed that a number of hamals die due to tetanus. An anti-tetanus vaccination campaign was undertaken in 1976 and 1982 to prevent these deaths. It is noteworthy that not a single casualty has taken place during the last 30 years due to this precaution. As part of the educational programmes a campaign to popularise family planning was also organised. It is especially significant in the background of the social status of hamals. Being marathas the hamals had feudal attitudes on gender issues. The family planning campaign indirectly helped in altering their perspectives on gender issues.

Hamals suffer from a number of health problems also because of non-availability of clean and healthy food. Most hamals leave their families in their native villages when they migrate to urban centres in search of work. They are, therefore, forced to eat outside. Besides they do not follow a fixed routine of work and are unable to make permanent arrangements for their meals. The panchayat started its own food

centres – community kitchens for the hamals known as 'Kastachi Bhakar' (Earned Bread). This is one of the most profitable programmes run by the panchayat for the last 25 years. Initially there were five women employees working under this scheme. At present there are in all 13 centres run under the scheme. There are around 150 employees among whom around 120 are women. Mostly from families of hamals and also from the destitutes, deserted women. These employees enjoy benefits prescribed by the government including the provident fund. Kastachi Bhakar had an annual turnover of about Rs 50 lakh during 1997-98. Apart from the land offered by the government on lease, the scheme is completely self-sufficient. It is run on a no profit, no loss basis and is managed by a committee of the panchayat appointed for these purposes. Its benefits are not restricted to hamals but to all poor people. A similar kind of state-aided community kitchens were established in the state in 1995 (Zhunaka Bhakar Yojana) after the BJP-Sena coalition came to power. These centres however could not prove viable though the government provided huge subsidies to them. The Kastachi Bhakar venture emerges as an important achievement of the panchayat. Similar centres have been established in many other towns of the state where the Hamal Panchayat has been active. More importantly, Kastachi Bhakar has helped in linking the hamals' movement with other social movements as it provides food at reasonable rates to all conventions conferences organised by the left and democratic groups.

Last but not the least the panchayat proposed a housing scheme for the hamals near the market yard in Pune. Taking the help of provisions under the Mathadi Act the panchayat has acquired five acres of land from the government at a low price. There will be 388 houses constructed on this land. Each house of 350 sq feet will cost one and a half lakh rupees. The hamals are expected to bear 25 per cent of the cost of the house and the rest is to be raised through loans. The Hamal Panchayat and the mathadi mandal are to be guarantors to these loans. Only those hamals who can bear the 25 per cent share of the cost can avail of this scheme. Besides only 400 hamals will be able to get houses under this scheme. All the same, hamals, are now able to own a house to lead a secure life.

An objective analysis of these social security schemes brings to the forefront the innovative mobilisation strategies that the panchayat practised while organising the unorganised. At the same time it also points to some of the limitations of mobilising these workers on an occupational basis. The social security schemes of the panchayat prove to be innovative in more than one respects. Firstly, the panchayat runs all these schemes on its own. No financial help from an outside agency is accepted. In continuation of the earlier feudal relations between traders and hamals initially the traders were willing to offer help to these institutions. However, the organisation refused these with a clearcut ideological position that such donations would blunt the edge of their conflicts against traders.

The position is more significant in the background of the rapidly increasing role of the NGOs in mobilising the unorganised and other weaker sections. The NGOs have been especially active in 'empowering' these sections by encouraging the establishment of co-operatives. The existence of these co-operatives ultimately depends on availability of the surplus capital in the world economy. Therefore the role of NGOs and international funding agencies remains very limited as far as mobilisation of the informal sector workers is concerned. In fact it is very likely that the financial help extended by funding agencies will ultimately ruin the movement.

The Hamal Panchayat has its own organisational network for managing the various welfare schemes. At present there are around 10 000 members of the panchayat in Pune. A leader is selected for every group of 50 members. There is a section-in-charge controlling the work of 10 such leaders. The executive council of the panchayat is elected after every two years from among the members. There are 14 committees to manage the affairs of the panchayat and the welfare programmes. Almost all the members of the executive council and the various committees are hamals themselves. The panchayat is opposed to the concept of appointing a full time, paid social worker for managing its affairs. During the last 40 years of its work there have been no serious allegations of corruption against the executives. The panchayat mainly operates in Pune. But it has initiated similar welfare schemes at

all other centres where it has been working during recent years. The welfare schemes appropriate the positive potentials of the Mathadi Act as far as possible, thus supplementing the state's welfare responsibilities with its own collective strength. It is a rare example of a trade union working in the informal sector erecting a self help infrastructure for its members without seeking any outside help. SEWA in Ahmedabad is perhaps the only other example of such an organisation [Rose 1992].

It has been traditionally believed that constructive work essentially compromises agitational politics. However these assumptions need to be revised while mobilising the workers in informal sector. It has been possible for the trade union movement in India to mobilise organised workers on the basis of certain favourable factors. First, the workers work in a single and centralised production unit. Secondly, the image of the 'class enemy' is concrete due to the definite pattern of employer-employee relations. Thirdly, these workers enjoy at least minimum protection of law. These factors contribute to increased levels of political participation of these workers. These factors are completely absent for the informal sector workers. It becomes very difficult to encourage them to participate in trade union activities due to the absence of any support structure. Most of these workers come from very poor groups. Their social composition reveals that socially they belong to the marginalised groups [Deshpande 1999]. It is impossible for these sections to gain the minimum security required for coming together to agitate. Co-operatives and social security schemes initiated by the trade unions would be of great help to these sections. Not only for bringing them together to fight for their causes but also to compensate for the lack of social and economic status at personal/individual level. The Hamal Panchayat has a slogan to express this idea: 'Ek Mat Samman Pat' (we demand equality of status along with equal right to vote). Constructive work in the form of workers co-operatives helps in building affinities with the organisation and is often seen by the workers as an expression of their collective strength [Bhowmik 1997]. It is in this sense that social security schemes initiated by the panchayat do not compromise the agenda of agitational policies. The panchayat sees them rather as effective mobilisational strategies for hamals and

other manual labourers.

For these strategies to become effective an awareness with regard to centrality of agitational politics and the necessity to continuously confront the state is required. Otherwise these efforts can easily become part of the state agenda of 'empowering' the weaker sections. The Hamal Panchayat seems to be aware of this problem. That is the main reason why it insists on keeping these units completely self-sufficient.

At yet another level these ventures are seen by the panchayat as efforts of interventions in the arena of civil society. The otherwise marginalised social groups are able to negotiate with the market and other institutions of civil society on their own. It becomes possible by erecting independent infrastructure on the basis of their collective strength. It is true that these measures are temporary and tentative. The state needs to be constantly confronted and made responsible for possibilities to operate in civil society and to realise the claims of distributive justice of these groups. The panchayat is also aware of the tentative character of its self help infrastructure and therefore continues its fight with the state at one level. At the same time the collective efforts on part of workers may help in gaining for these groups a respectable position in the affairs of civil society. It is hardly possible that civil society would respect a hamal even if he earns as much as a white collar employee. The marginalised groups are at least able to assert their existence in civil society through these collective ventures.

The other problem about these efforts by the panchayat is related to identifying hamals as the main in some cases, exclusive beneficiaries of the social security schemes. The Hamal Panchayat has mobilised its members on occupational basis. There is nothing wrong in it as occupational identity provides the most concrete criterion for mobilisation. However, the occupational identity proves problematic if it replaces the overall social identity of hamals. If the institutional infrastructure in terms of a clinic, shop, housing scheme, etc. is developed exclusively for hamals, there is a danger that their occupational identities would become all pervasive at the cost of their other identities. It can be a welcome development especially with regards to caste divisions among hamals. However if hamals mainly come from the marathas such a possibility remains distant. In such a situation how will it be possible for the

hamals to relate themselves to other oppressed groups? In other words what sort of an alliance of hamals and other unorganised workers is imagined by the panchayat if occupational identities dominate their social space also?

ASSOCIATING WITH OTHER UNORGANISED WORKERS

The Hamal Panchayat has sought its own answer to the above mentioned question. By now most of the essential economic demands of the hamals have been fulfilled either through the state or through their own efforts. It is at this juncture that the panchayat started associating itself with other groups working in the informal sector. It has emerged as a nodal agency for other allied organisations working among auto-rickshaw drivers, street vendors, rag pickers, construction labourers, etc. All these organisations are formally attached to the Hamal Panchayat. Most of the credit for such association goes to Adhav's leadership and the ideology that the panchayat has adopted owing to his leadership.

Right since its inception the members of the Hamal Panchayat participated in a number of social movements in Maharashtra. Adhav himself led a number of movements challenging caste-based injustices and other forms of social inequality.⁵ Members of the Hamal Panchayat took an active part in all these. This helped in associating the hamals with other socially and economically oppressed groups. In one such incident the hamals joined the movement for rehabilitation of the devdasis where they offered the devdasis a bhaubhet. Being male and from the maratha caste, hamals can be assumed to have a chauvinistic perspective towards these sexually oppressed (mostly dalit) women. Their association with the devdasi movement helped a lot in redefining the hamals' perspective towards gender issues. In other cases the hamals actively associated with dalits, bidi workers, dam affected, slum dwellers, etc., in their struggles against injustices. The Hamal Panchayat mobilised its members on an occupational and economic basis. On the other hand it encouraged the members to participate in struggles against caste inequalities. These struggles addressed caste question as a crucial aspect of the transformative politics imagined by the panchayat.

A more fruitful and wholesome association of hamals and other oppressed groups emerged with their alliance with other organisations working in the same area. These organisations have emerged only recently during the 1990s. Once successful in mobilising hamals, Adhav and the panchayat consciously shifted their attention to other unorganised workers. They deliberately chose to formally associate these groups to the panchayat. Most of the newly organised groups belong to the service sector. These labourers prove to be the most unwanted sections of the urban society. A majority of them are among the recent migrant groups to the city. Except the autorickshaw drivers and to some extent the vendors the other groups do not have any resources at their disposal. Even the auto-rickshaw drivers and the street vendors get pushed to the periphery under changing economic conditions. The rapidly growing Indian middle class needs and enjoys their services but does not respect their right to survival. Some of the groups organised by the panchayat had to fight to acquire the status of a worker. The rag pickers for example are not even regarded as workers as it was held that they do not engage themselves in any productive activity. These groups almost exclusively consist of lower castes with the autorickshaw drivers coming from other backward classes and dalit castes while the rag pickers and construction labourers from among the dalits. There is a very high percentage of women workers among the two latter groups [Deshpande 1999].

The allied organisations have developed a similar pattern of their politics to that of the Hamal Panchayat. They make claims to the state for fulfilling their economic demands and for formalising their status as workers. Most of the groups have demanded protection under the Mathadi Act by expanding its scope or creation of a similar act for their occupations. Similarly they have been trying to expand their work in other urban centres of the state by organising statewide conventions of like minded groups. This, they hope, would facilitate a more effective intervention in mainstream politics on the part of the informal sector workers. At the same time they are engaged in erecting their own self-help infrastructure as per the requirements of their profession. Though these organisations function separately on an occupational basis, they share each other's agenda because of their association with

the Hamal Panchayat and its ideology.

The Hamal Panchayat's association with these organisations proves politically educational for the hamals. It has been observed that their association is not merely notional but the hamals actively participate in the work of other organisations. In fact, even if the association remains formal it would definitely be helpful in the long-term politics on behalf of the informal sector. Capitalist development in India has resulted in emergence of the contradictory class locations [Wright 1985]. As a result of these an occupational and social hierarchy is created even within the informal sector. Hamals would perhaps be placed at the top of this hierarchy along with the rickshaw drivers. It is both because of their economic status which the hamals achieved due to state protection and the rickshaw drivers because of availability of capital and also because of their high status in the traditional caste hierarchy. In this background if the Hamal Panchayat works to establish a formal association of its members with, say, rag pickers (mainly consisting of dalit women), it must be considered as a very significant contribution to the politics on behalf of the oppressed. The Hamal Panchayat's role as a nodal agency of organisations of other unorganised workers, helps in it to create a broad-based alliance of these workers. Against the background of the failure of the trade union movement in the organised sector, a political alliance of informal sector workers gains added significance. The Hamal Panchayat's work not only helps in transcending tendencies of economism in trade union politics but also in expanding the ideological base of the movement.

The Hamal Panchayat's experiments in organising the unorganised point towards the possibilities of mobilising large sections of the urban poor primarily on the basis of their occupational identities. It is evident that urban poor mainly consist of informal sector workers. Effective strategies for political mobilisation of urban poor need to be elaborated against the background of their completely distorted pattern of life and their lumpen status. The urban poor can be characterised in terms of unemployment or underemployment; inevitable choice of residential location in slums, unwilling detachment from the traditional bonds of (village) community and low caste status. All these factors contribute to their peripheral location in urban societies. It becomes very difficult

to mobilise the urban poor and make effective intervention on behalf of these groups. The task is difficult because none of these identities seem to be adequate to provide a viable political basis to their struggles.

For example caste identities of the urban poor are neither completely lost nor are they fully expressed. Expressions of caste system in an urban, industrial economy prove to be complex. At macro level lower castes still remain attached to lower rung occupations. On the other hand the traditional association between caste and occupational hierarchy seems to be retained by the capitalist development. A more serious implication of this association is expressed when the lower, especially dalit castes seem to be insisting on having monopoly in lower rung occupation due to lack of possibilities of entering into any other respectful occupation [Everett and Savara 1993].

In short, capitalist development retains caste injustices and perhaps reinforces them in a more complex manner. Any efforts at mobilisation of urban poor or informal sector workers needs to address caste question but cannot rely on their caste identities exclusively. Similar is the situation with slum-dwellers. Common locality and common conditions of life (in terms of lack of infrastructure) may create common bonds among the slum-dwellers. However, these bonds do not prove adequate for effective political mobilisation because the other economic and social identities tend to disturb their unity as slum-dwellers [de Wit 1996]. It will be significant to note that Adhav had earlier tried to mobilise the slum-dwellers in Pune during 1965-70. However he dropped the idea [Deshpande 1989]. The common locality of the urban poor does not emerge as an adequate criterion for mobilising them. Therefore most of the experiments of organising slum-dwellers are operating in pockets and are dominated by the NGOs. It has not been possible to erect a sustained and effective political movement on behalf of the slum-dwellers.

The Hamal Panchayat's efforts to mobilise the sections of urban poor on the basis of their occupational identities prove to be crucial in this respect. Occupational, economic identities of the urban poor may be appropriated to encourage effective political intervention on their behalf. The panchayat seems to be operating on these lines with manual labourers as the vantage point. It has been supplemented by the

panchayat's understanding of the caste question and its attempts to bring it to the forefront. Most importantly the Hamal Panchayat works to create a broad-based alliance of these groups even if it organises the workers on an occupational basis. Because occupational identities are a concrete form of economic and social identities of the workers make the approach of the movement is. At the same time the work of the panchayat transcends the constraints of practicality by accepting the role of a nodal organising agency of different sections of the informal sector.

Struggles on behalf of the unorganised sections become more difficult under the present course of capitalist development in India. The existence of contradictory class locations creates divisions not only among the oppressed but also among the established. The simple constructs of class enemy do not work in such a situation. Any effort of consolidation of strength on the part of the poor not only upsets the bourgeoisie but more significantly the middle class. The contemporary middle class in India does not sympathise with the poor. This was evident in cases of Rickshaw Panchayat in Pune and the street vendors in Mumbai (*Maharashtra Times*, May 3, 1998). Both agitations caused agonies mainly for the middle class. It is in this sense that the present civil society in India is not only unsympathetic to these groups but is keen on delegitimising their social existence. Much cannot be expected from the state in this regard. There is a general agreement over the fact that the state will minimise its welfare responsibilities in the coming period. It is going to be very difficult for the peripheral social groups like workers in the informal sector to force the state to listen to their demands. Under these conditions these stepchildren of Indian capitalist development seem to have a weak future.

The experiment conducted by the Hamal Panchayat shows that collective, mobilisational strength is the only possible weapon available to these groups in building up their struggles against the existing mode of capitalist development. Therefore the panchayat has appropriated every possible strategy to mobilise and consolidate their collective strength. The panchayat works to retain state support by forcing the state to perform its welfare responsibilities. Simultaneously it forces the civil society to recognise the existence of these groups and also forms the self help

infrastructure to assert the identity of informal sector workers in arenas of both state and civil society. As a part of its transformative political agenda the organisation also works for a broad based political alliance of the unorganised workers and the poor. By combining the constructive with the agitational the Hamal Panchayat has developed a model experiment for organising the unorganised.

Notes

[This paper is based on a detailed case study of the Hamal Panchayat and allied organisations, undertaken by the author during 1998-99. The author is thankful to Maharashtra Foundation and Abhinav Bhashabhyas Kendra, Mumbai for their financial assistance, and to the workers of the Hamal Panchayat for their help and co-operation. All references in this paper regarding the work of the panchayat are from this study unless otherwise mentioned.]

- 1 Vasant Deshpande had undertaken these surveys as a part of his study of Hamal Panchayat during 1985-86. The study documented the work of the panchayat till 1985-86. See, Deshpande (1989).
- 2 Mathadis or head loaders in Mumbai mainly hail from the regions of western Maharashtra. The maratha identity of the mathadis makes them important for the Congress politics in the state. The Mathadi Kamgar Union was established under the leadership of Annasabheb Patil, a veteran Congress leader during the 1950s. Even today the union continues its association with the Congress.
- 3 Baba Adhav initially worked with the Socialist Party in Maharashtra. Later he initiated and developed the Hamal Panchayat and other organisations of manual labourers. Adhav sees the category of manual labourers ('kashitakar', 'anganthanamati kamgar') as a focus point for political mobilisation of the lower class and castes. Apart from his efforts at mobilising the unorganised workers, Adhav has been leading a number of social movements targeting caste, class and gender inequalities. He has contributed a great deal in developing Phule's anti-caste discourse.
- 4 Levy is utilised for providing provident fund, earned leaves, bonus and compensation in cases of accident. The administrative expenses of the mathadi mandals are also managed through the levy.
- 5 Among the anti-caste movements initiated by Adhav the most important was 'Ek Gaon Ek Panavatha Mohini' in which details in several villages demanded access to public water supply. Adhav also played an active role in the Nampantar movement during 1977-80. His efforts to mobilise the lower caste class women, like devdasis and bidi workers must also be noted as a significant contribution to the women's movement in India. All efforts of mobilisation initiated by Adhav simultaneously focused on the caste-class gender injustices.

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Working Class Militancy in Endangered Sugar Industry

Gopal Guru

The sugar industry in its present co-operative-dominated form is under threat from the forces of privatisation and globalisation. Sugar factory labour, which has forged all-India solidarity, is fighting for the co-operatives' survival. The possibility of an alliance between these workers and the sugarcane cultivators, hitherto very inadequately mobilised against the threat, has become a real one.

THE sugar industry in India has four main sectors: the co-operative, corporation and state sectors and the private sector. The co-operative sector dominates the sugar economy. Of late, the co-operative sector and even the private sector have been facing a serious crisis, including the prospect of a complete collapse and subsequent gobbling up by the forces of privatisation and globalisation. The co-operative sugar mills are increasingly facing the threat of closure. On the other hand, they are also facing the prospect of privatisation.

However, the Indian state is finding it difficult to go the whole hog with its project of privatisation of the sugar co-operatives. It still faces a challenge to this hidden agenda from sugar factory workers and sugarcane cultivators. The state has therefore chosen to adopt an indirect approach to privatisation. Maharashtra is in the forefront in this mission. The Shiv Sena-Bharatiya Janata Party (BJP) government of the state has been making consistent efforts to bring about privatisation of the sugar industry through the back door.

The government has adopted certain strategies. First, it has been trying to privatise water resources, particularly medium and small dams.¹ One of the leading industrial firms in the state did a survey in 1994 to find out the possibilities of privatising the water resources in the state.² The government has also moved towards abolition of the cane zoning system. Under this system, the state government has to reserve a certain cane area for each sugar factory and it therefore becomes mandatory for a cane grower to sell his produce to the factory which controls this zone.

The purpose of the zoning system is to avoid unhealthy competition and prevent the monopolisation of cane by certain powerful sugar factories which in the absence of the system are likely blatantly to use means which are either scrupulous (paying higher prices) or unscrupulous

(plunder) to acquire the cane. The employment of such means would adversely affect cane supply to weak factories and their viability.

Thirdly, the state government has been supporting the privatisation of electricity supply. Once the power sector is privatised completely, the co-operative sugar sector would become vulnerable to harassment by such private owners of power utilities, particularly multinational corporations (MNCs), as may be interested in acquiring a stake in the sugar industry. It is due to this possible threat that some of the sugar co-operatives are planning to generate their own power from bagasse, a waste product of the industry.³ As a matter of fact, the invasion of the sugar industry in India by MNCs has begun. Already, Gay & Turbo Co, based in London, has bought half the shares of a private unit in Uttar Pradesh.⁴

Finally, it is alleged that the Sena-BJP government has been trying continuously to create financial problems for the co-operative factories by withholding or delaying the pre-season loans which the Congress regime had first made available to them. If water, finance and power are controlled by private parties, including MNCs, will the co-operative sugar sector or even the private mills survive, particularly in the age of globalisation?

The market for Indian sugar, even the domestic market, is likely to shrink even further because of one offshoot of globalisation: the import of sugar, and with tariff exemption at that – even while excise and purchase tax are levied on every bag of indigenous sugar.⁵ As for the export market, it is worth noting that the US, which till 1997 was one of the major importers of Indian sugar, does not have to import sugar from Latin America as it is now producing cane through genetic farming.

Apart from such external dangers, the Indian sugar industry is facing internal ones, which are considered much more serious. Apart from delays in payment, the

cane cultivators in different states face the problem of not getting fair prices for their produce. Moreover, they are subjected to illegitimate deductions from their cane bills, and the fact of cheating in the weighing of cane is an open secret. And the farmers' bills are never paid in time or at one go. The co-operative sugar mills which are weak and sick have not been able to pay the cane-growers' dues for months together. Such defaulting factories are found in Maharashtra, Karnataka, UP, Tamil Nadu and Gujarat.

The cane cultivators are also facing political and cultural problems. The sugar co-operatives all over the country have failed to democratise their power structures. The top 10 per cent of the shareholders, particularly the dominant political families, control the co-operatives in Maharashtra.⁶ While the largest shareholders tend to control the sugar factories in Karnataka and Tamil Nadu as well,⁷ in Maharashtra what M N Srinivas calls the 'law of incumbency'⁸ has perpetuated the rule of single families over the sugar co-operatives.

FACTORY WORKERS' PLIGHT

The plight of the sugar factory workers is perhaps worse than that of the cane growers, for the former are facing the prospect of displacement from their jobs. Lakhs of sugar workers in the country have been facing total disruption of their lives, particularly in recent years. This is due to the closure of co-operative factories in most of the states. Moreover, sugar workers have not received their wages for months on end.

The sugar workers in the country have been seeking for several years, but in vain, wage parity with urban organised-sector labour, standardisation of wages in the industry and gradation and proper classification of the workers according to skills. Even the wage board recommendations which were brought into force in 1989 have not been implemented in many factories to this day.⁹ As a

matter of fact, the sugar workers have not demanded implementation, as they believe the recommendations are unfair to them.¹⁰ The seasonal workers of some factories in UP, Maharashtra, Karnataka and Tamil Nadu have not been getting the benefit of retention allowance, house rent allowance or medical allowance, not to mention provident-fund benefits.¹¹

Apart from these problems, the workers of most of the sugar factories lack adequate housing. In Maharashtra the accommodation provided is sometimes dangerous in that the huts, arranged in rows, are made of bamboo material and are hence vulnerable to fire.¹² Industrial safety has been another constant problem in the sugar industry. As the machines in the factories, particularly in UP, have become very old, industrial accidents, some of them fatal, are frequent.

CULTIVATORS' RESPONSE

During the period of globalisation, the peasant movement in the country has had differences on the question of the new economic policy (NEP), particularly its impact on the peasantry. While the peasants led by Mahindra Singh Tikait of UP and Nanjundaswamy of Karnataka have opposed the forces of globalisation, the Shetkari Sanghatana led by Sharad Joshi is supporting them almost unconditionally.¹³ Every privatisation effort is a welcome move for the latter organisation, which shows contempt for the sugar co-operatives in Maharashtra.

It is not difficult to comprehend the Sanghatana's agenda. It has been transparent ever since the NEP got under way. The Sanghatana had once made the Indian state its object of contention because it wanted to secure remunerative prices for sugarcane. But now that it wants to secure international prices for cane it is trying to bypass the state. For the last few years the Sanghatana's leaders have been invoking the peasants' egos against the subsidisation of cane cultivation, thus advocating the free-market logic. However, the Shetkari Sanghatana has lost its strength in Maharashtra and is not able to mobilise the peasantry the way it used to in the mid-eighties.

This author's observation is that while the cane cultivators in the country are worried about the fate of the sugar co-operatives, at the moment they see only mismanagement and corruption as major issues, failing to perceive completely the danger of the co-operatives being gobbled up by global forces.

This does not mean that the cultivators have given up protesting against the existing structure of cane prices. They have been agitating quite militantly, and this was evident from the agitation that the cane-growers of Sangli and Kolhapur districts (western Maharashtra) and Nanded district (Marathwada) carried out in 1997.¹⁴ The fact that the Sanghatana supported this agitation shows that it still finds it difficult to put forward its free-market agenda for mobilisation purposes.

This agitation was unique in that it was carried out autonomously by the peasants. The political parties confined themselves to support from the outside.¹⁵ Similar agitations for more remunerative cane prices have been taking place in Karnataka, where the farmers have also been demanding the payment of monies due to them from the co-operative factories.¹⁶

However, farmers' agitations, particularly those centred on cane prices, are all too often scuttled by shrewd factory managements, particularly private managements. In Karnataka and UP the managements offer the farmers certain incentives like free seed and fertiliser.¹⁷ In Maharashtra the co-operative managers use kinship ties and the language of patronage to smother the peasant's critical consciousness. This language makes the cultivators unavailable for militant mobilisation. It is due to the complex interplay of this language that peasant leader N D Patil could not effectively mobilise the cane-growers of western Maharashtra on the issue that their relationship with the co-operatives was only a seller-buyer equation and that no moral considerations came into the picture.¹⁸

There is a small section of the peasantry which wants to withdraw from sugarcane by shifting to some other crop which can fetch quick returns. Cane-growers throughout Maharashtra switched to soyabean cultivation in 1996.¹⁹ In UP cane was sold to 'khandsari' units, which make payment immediately, but some farmers still shifted to menthol production. However, such shifts are not taking place on a large scale. By and large the farmers still stick to cane cultivation because it is less vulnerable to market fluctuations.

Although the peasantry seems to be in favour of co-operatives, their mood has not been properly channelised by the supporters of the co-operative movement in the country. The organisation of sugar co-operative managers has been against the Maharashtra government's privat-

isation moves. But they are not seen to be making sincere, bold and persistent attempts to mobilise the peasantry against the state government's designs or the global forces. As the Left parties are also in a state of political-ideological slumber, there is a political vacuum.

Can the sugar workers' movement in the country fill this vacuum and give the peasantry a lead for protecting the co-operative industries? What has been the sugar workers' response to the ongoing crisis in the industry? Does it differ from what was manifested during earlier phases of sugar-worker activism?

WORKERS' MILITANCY

In view of the crisis in the industry, the sugar workers are now forced to fight not only for their own immediate survival but for the survival of the industry itself. This has evoked high levels of militancy in terms of both form and content. This ever-growing militancy, directed at subversive forces at all levels, seems to belie the claim made in the co-operative sugar factories' annual reports to the effect that the sugar co-operatives look after the welfare of their workers.²⁰

This claim is supported by some important researchers.²¹ But a sensitive scholar like B S Baviskar would like to qualify it as he is sceptical about the democratic dimension of the sugar co-operatives.²² Another scholar rightly sees working class militancy within the sugar co-operatives and questions the official thesis of class conciliation between the workers and the managements.²³

However, this contestation of the official claims by these scholars seems to be quite fragile. It does not offer any serious and systematic critical account of the official version, being largely impressionistic in nature.²⁴ Baviskar's analysis, though accurate and specific, does not help us to understand the working class response to the new challenges that have sprung up in the NEP phase and the threat of privatisation of the sugar co-operatives.

Working class militancy in the country is not an overnight development. It has been the legacy of a trade union movement that struck early roots in UP and Maharashtra. In these states the sugar workers started organised struggle against the private sugar mills' owners even before independence.²⁵ After independence the sugar workers' militancy seems to have been articulated in an organised form, and it also started operating at the regional level. Some of the sugar workers' unions

took shape at the state level, but this did not make them less militant than the unions under the banners of the Indian National Trade Union Congress (INTUC), the Hind Mazdoor Sabha (HMS) and the All India Trade Union Congress (AITUC).

For example, the movement led by the Mahasangh (Lal Nishan Leninist, a Left group in Maharashtra) showed extraordinary militancy on sugar workers' issues.²⁶ In Tamil Nadu, the sugar workers' unions are directly linked to regional parties like the Dravida Munnetra Kazhagam (DMK) and the All India Anna Dravida Munnetra Kazhagam (AIADMK).²⁷ Of late the emergence of the BJP as a force in Indian politics has led to the emergence of unions affiliated to the Bharatiya Mazdoor Sangh (BMS) in some sugar units in UP and Gujarat.²⁸

In Maharashtra and Gujarat sugar workers' unions are recognised under the Bombay Industrial Relations Act (BIR Act), 1948. If a particular union in an industry is recognised in terms of the act in a taluka, other unions cannot be bargaining agents in the factories within the taluka's jurisdiction. Because of this, the Shiv Sena and the BJP have not been able to form unions in Maharashtra's sugar co-operatives. The Sena-BJP government is now trying to make changes in the act. For want of such an act in UP, one can find between two and ten unions in a single factory in that state.²⁹ A similar situation prevails in Andhra Pradesh.³⁰

In the early years, trade union activism in the Indian sugar industry organised workers mainly at the factory level and centred its demands on a better wage structure and industrial safety. There was no broader issue that could forge political solidarity among the sugar workers even at the regional level. But today the sugar workers' movement has established linkages of mobilisation between the regional and national levels. The formation of the National Sugar Workers' Co-ordination Committee brings out this broader character of the movement very clearly. Several state-level unions which have federated themselves are affiliated to this committee in which the state-level federations are represented.³¹

Another important departure from earlier trends is the fact that the sugar workers' movement no longer makes its political position non-negotiable. On the contrary, the movement consciously eschews isolated political efforts while it takes on its adversaries in India and abroad. It does not work under the burden of party dictation and control, and it is due to this

relative autonomy that the sugar industry workers have been able to forge national solidarity.

Another qualitative shift in the political agenda of this trade unionism is that the unions' leadership has been organising not only the sugar workers but also other toiling sections like harvesters, transporters, landless agricultural labour, the agricultural workers serving state land corporations and forest workers. This larger unity is found in Maharashtra, UP and Tamil Nadu.³² This organic intellectual dimension of the sugar workers' leadership, to use Gramscian terminology, shows that the sugar workers' consciousness is progressively moving away from narrow provincialism and towards universalism. This consciousness is also moving away from mere economism and towards larger social and political concerns.

The sugar workers have shown interest in forging an alliance with the cane cultivators for dealing with common problems relating to the sugar industry. For example, the sugar workers of Maharashtra under the joint leadership of the HMS, the Mahasangh and to some extent INTUC have been collectively mobilising the peasantry on the question of fighting bad tendencies in the co-operative sugar units. This kind of unity was evident in the workers-peasantry combined meets at the Nashik and Panthan state-level conferences held in 1988 and 1989 and in 1997.³³ In some sugar factories, like the ones at Killari, in Latur district, and Kannad, in Aurangabad district, sugar workers, with cane-growers' support brought about the overthrow of corrupt managements in factory elections in 1989.³⁴ This shows that the sugar workers and the cane-growers can make common cause for safeguarding the health of a factory.

Interestingly, Nagnath Naikawedi, founder of the Hutatma Kisan Ahir factory at Walve, in Sangli district, has been playing a significant role in jointly organising workers and peasants in Maharashtra. Together with Kishore Pawar of the HMS and Mahasangh secretary Madhukar Katre, Naikawedi, who is also secretary of the National Sugar Workers' Co-ordination Committee, took the initiative in organising a state-level conference at the Walve factory on December 13, 1997. Similar joint mobilisation efforts have been reported from UP, Karnataka and Tamil Nadu. Sugar workers joining hands with the peasantry has become a possibility during the globalisation era.

Another aspect is that there seems to have been a remarkable shift of late in the

forms of protest adopted by the sugar workers' organisations. All over the country, the workers had earlier resorted to militant forms ranging from the flash strike to the indefinite strike even during the crushing season. Today, it is only rarely that we see workers resorting to that kind of protest action; the one-day strike and the bandh are in vogue.

The national co-ordination committee seems to have used the one-day formula very frequently, particularly in recent times. But the protest has an all-India dimension, and the workers' demands are universal rather than local and merely economic. The demands are negotiable and not extreme in nature. They are couched in language which shows concern for the viability of sugar units.

If one looks at the 24 demands that the national co-ordination committee has recently submitted to the central government, the defensive nature of the sugar workers' trade unionism becomes clear. This charter shows that the sugar workers are now concerned about the very survival of their means of livelihood - the sugar factories. It contains not demands as such but suggestions for salvaging the sugar industry.

In Maharashtra, particularly in the sick sugar factories, this constructive working class attitude has already been evident in quite a few factories, like the Ganesh factory, in Parner taluka of Ahmadnagar district - whose workers have accepted reduction of their wages by 20 per cent.³⁵

Yet another illustration from Maharashtra throws ample light on the positive and constructive approach that the sugar workers in India have adopted towards the crisis that the sugar industry is facing. The sugar workers (sleep boys, field staff) and in some cases even the harvesters have prevented cultivators from selling their cane outside the defined boundaries (zone) of their parent factory.³⁶ In other words harvesters and field workers have taken the initiative to ensure a steady supply of sugarcane to the sick units in the state.

The sugar workers' collectives, particularly the Mahasangh and the HMS unions, have shown a sense of urgency and stood against the caste and communal forces from time to time and have thus tried to create a broader social and secular consciousness among the sugar workers.³⁷ Most importantly, the sugar workers' movement in the country has marched ahead with the common minimum understanding that was considered necessary for facing the enemy collectively without

being fuzzy about its own political line. The movement has been attempting with success to dissolve internal political differences for the larger cause. At the same time one must also take note of the limitations that the sugar workers' movement is suffering from. The movement is facing important challenges.

CHALLENGES BEFORE UNIONS

The challenges that sugar workers in the country seem to be facing are both external and internal. Among the external ones is the role of the state, which has been trying to suppress the growing militancy of the movement. For example, the UP government, whether led by Mulayam Singh, Kalyan Singh or Mayawati, is alleged to be in favour of the privatisation of co-operative mills.³⁸ It is alleged to be taking decisions that favour the millowners and not the sugar workers.

In Tamil Nadu, the role of the state has been even more repressive. When the sugar workers protested against a government move to sell a co-operative factory to private owners in 1995, the police opened fire on the striking workers. It is reported that a worker was killed in the firing.³⁹

In Maharashtra, the Sena-BJP government has been consistently playing an anti-sugar-worker role, which of course is politically motivated. It has created problems about payment of the arrears that are due to the sugar workers.⁴⁰ It has shown no urgency about solving the wage problems of the thousands of workers who are displaced owing to the closure of sugar mills. It is also alleged that the state government has not been granting audience to sugar workers making demands.⁴¹ Some of the external challenges the sugar workers are facing come from the peasantry. For example, the cane-growing peasants are reported to have severely beaten up sugar workers in Gujarat some years ago and following this assault the sugar workers had to leave the factory.⁴² It is also argued that government officials in UP and the Sugar Mahasangh in Mumbai create rifts among the sugar workers and thus undermine working-class solidarity.⁴³

One of the serious, internal challenges the sugar workers' movement is facing is that in some leading states like UP, particularly in the private and corporation sugar mills, the workers' union loyalties are hopelessly divided. There are several unions in these factories, the number in some cases going up to 10.⁴⁴ The average number of unions in a factory is four or

five.⁴⁵ The millowners promote factionalism among the workers by offering some perks as bait. For example, the owners of the Dhampur private sugar factory, in UP, are alleged to have helped a union leader to start his own small khandsari unit.⁴⁶ The owner of a sugar mill in Karnataka has helped a union leader to build a religious structure.⁴⁷ It is also reported by workers that the owner of this factory tries to keep the workers in good humour by distributing foodgrain and edible oil.⁴⁸

It is the possibility of 'lucrative bargaining' that makes sugar workers launch new unions. Multiple unionism provokes fierce competition for membership, and in the process it creates constant tension and enmity – which suits the millowners.

Although the corporation and co-operative mills in UP are controlled by government officials, these officials, like the owners of private mills, fan hostilities among the sugar workers for the purpose of dividing and dominating them.⁴⁹

Thus, co-option of sugar workers through the process of 'lucrative bargaining' takes a toll of the trade unions in the sugar industry. Such co-option has been subtle in co-operative factories that are managed by boards of directors, particularly in Maharashtra. The trade unions in some of the old, well-established factories in western Maharashtra have been reduced to insignificance. They have been functioning as 'company unions'. It is alleged that the subordination of a workers' union to a sugar baron of Sangli district was so complete that the union undertook in writing not to go to the labour court against the factory management.⁵⁰

The workers' representatives on boards of directors, particularly in Gujarat and Maharashtra, do not truly represent the cause of the workers. They are nominated to the general bodies of the boards, whereas it is only the core executive body that takes all the important decisions regarding the financial transactions of the factory.⁵¹ Secondly, the workers' representatives make all kinds of compromises with the managements for personal reasons.⁵² In a few factories in Maharashtra, however, the workers representatives are reported to be representing the cause of the sugar workers sincerely and faithfully.⁵³

Yet another important limitation of the sugar workers' movement in India is that it is divided on caste, linguistic and regional lines. An important leader

from UP lamented that the sugar workers' movement could not concretise the concept of 'worker' in the sugar industry as the primary identity of the workers is rooted in their respective social and caste backgrounds. There are caste-based unions in sugar factories in Tamil Nadu.⁵⁴

It has been the common experience that casteism within the factory is promoted by the factory owners. In almost all the private factories in UP and Karnataka, for example, one finds that the upper-caste workers are employed in the key positions, the dalits in manual work and in the sanitary division and the intermediate castes in the technical occupations. Due to such casteism dalits are reported to have floated caste-based unions in sugar factories in Tamil Nadu.⁵⁵

Moreover, a section of the sugar workers is affected by regionalism. In some factories in UP and Gujarat, where there is a lot of sugar worker migration, one comes across tension on the lines of region and language. In Gujarat there is a barrier between Marathi and Gujarati speakers.⁵⁶ In UP workers from the western part of the state resent the workers from the eastern part.⁵⁷ Another important limitation of the sugar workers' trade unionism has been that the mainstream leadership has developed elitist tendencies and thus created a cultural and social gap between leadership and rank and file. It is alleged that the leaders are not accessible to the common workers and that whenever they are available the common workers seldom understand the language spoken by their leaders.

Due to this changing character of the leadership and the lack of communication skills on the leaders' part most of the common workers are not fully aware of the dangers of globalisation. The workers may have participated in anti-globalisation mobilisation but it would have been a passive sort of mobilisation.⁵⁸

Yet another limitation that the sugar workers unionism is suffering from is that it has not been adequately sensitive to employment opportunities for women in the sugar industry. The number of women 'workers' in the sugar industry can be counted on the tips of one's fingers. One study shows that in a sample of 82 sugar co-operatives there were only 167 women.⁵⁹ Women are employed in the sanitation departments or the guest houses of the factories. This indicates gender bias.

Finally, the challenge before the workers is to enlist the support of the peasants,

who otherwise tend in most of the states to be indifferent to the genuine problems of the sugar workers where they are not positively hostile. For example, the cane-growing peasants from Gujarat allegedly beat up some sugar workers a few years ago on the question of a strike.⁶⁰ In Maharashtra one comes across a domineering attitude on the cane-growers' part. Very often the cultivators are found inflicting humiliation on the sugar workers. Actually, on many occasions the tension between the workers and the peasantry is implanted by the managers of the co-operative units and the owners of private mills.

In recent years however, the National Sugar Workers Co-ordination Committee has assumed the responsibility of speaking for the cane-growing peasantry. This should help create mutual trust and confidence between the workers and the peasants.

SUMMING UP

The sugar workers in India are planning to devote special attention and energy to four things. The first thing is the impact of the economic policy changes. The sugar workers' response to the changes is uneven in terms of social base but encouraging. Independent political initiatives outside the ambit of the mainstream political parties are not enough. There is great urgency to strengthen both vertical and horizontal unity among the sugar workers in the country and abroad. What the sugar workers in Latin America are doing could serve as a model.

The sugar workers' complex problems demand the preparation of a viable and promising political agenda – without, of course, subordination to a political party. In other words, the agenda should be shaped not only by the top-level leadership but also by the creative responses of the rank-and-file sugar workers. Hereafter it is imperative for the sugar workers' leaders to keep formal party politics out of trade union activism and to invoke a new kind of trade union politics that would open up social corridors among several toiling components of the sugar industry. To achieve this broad community of the sugar workers not only in India but abroad as well, it would be necessary for the leaders to share information with the workers at the grass roots level. This would help the sugar workers' movement to achieve strength, confidence and solidarity, both national and international.

Labour Legislation and Social Justice

Rhetoric and Reality

Debi S Saini

This paper attempts to articulate and understand the working of the labour relations law framework related to labour organisation and labour dispute processing as it stands structured in the Indian political economy: what does the working of the legal system actually reveal; what institutional processes and what forces exacerbate neutralisation of labour empowerment; who eventually benefits in the exercise; and what concrete manifestations of labour disempowerment processes are visible. The paper is an exercise in sociology of labour law. It is based on data related to sociological reconstruction of some labour organisation cases taken from the actual field setting.

I Introduction

PROVISION of opportunity to work for its people and providing for dispensation of labour justice to them are important aspects of social justice responsibility of any state. In third world countries – and especially in a country like India – these aspects get added significance where a large percentage of people live below the poverty line¹ and suffer from problems of unemployment and underemployment and commission of unfair labour practices (ULPs) by employers against them. A mere 8.3 per cent of the Indian labour force is organised, the majority of which mainly belongs to the public sector. It is estimated that not more than 2 to 3 per cent of the labour force in India has access to assertion of labour rights through collective bargaining process. Working people in all societies – and more so in developing societies such as India – are highly vulnerable to exploitation at the hands of the inherently more powerful employers. As Otto Kahn-Freund rightly puts it:

Typically the worker as individual has to accept the condition which the employer offers. On the labour side, power is collective power...the relation between an employer and an isolated employee or worker is typically a relation between a bearer of power and one who is not a bearer of power. In its inception it is an act of submission, in its operation it is a condition of subordination, however much concealed by that indispensable figment of the legal mind known as the contract of employment [Kahn-Freund 1977, 17].

The individual contract of employment cannot challenge the unilateral rationality of managerial prerogatives. This gives rise to the need to allow labour to unite, form collectives, and thus struggle to alleviate its poverty on its own. Unionisation and collective bargaining lie at the root of most labour relations issues. Interestingly, Article 23 of the Universal Declaration of

Human Rights adopted by the United Nations as a common standard of achievement for all people in all nations recognises the legitimacy of union rights. It provides, among others, for everyone "the right to form and to join trade unions, for the protection of his interests".

Democratic states consider the organisation of labour struggle as an important human right and a basic condition to building an enlightened society. In regard to uplifting the conditions of the poorer sections of society, the Indian Constitution commands law in the model not of "politics of production" but of "production of politics" [Burawoy 1985] and a programme of action for empowering these sections, including labour. Ironically, however, studies of social justice and "poverty studies" are still a "nascent enterprise" in India [Baxi 1988: x]. The Indian labour law system projects the rhetoric that these laws will work as important instrument for empowering the powerless and the downtrodden so as to realise the cherished goals of the Constitution. All branches of the state are enjoined to facilitate the realisation of these goals. A large number of labour laws were enacted in independent India to operationalise the constitutional vision, and the labour bureaucracy was entrusted the role of ensuring compliance of these laws. In the developed world, especially the UK, voluntarist labour law frameworks have been nurtured, particularly till the beginning of Thatcherism. The Indian system, however, reflects a centrifugal labour-justice model. The state has also reserved for itself tremendous discretionary powers in certain aspects of labour-justice dispensation, especially in the area of labour relations law. The Indian judiciary has, undoubtedly, played a salutary role in progressive articulation and interpretation of the scope of these laws.

In any discussion on labour relations law as a tool for poverty alleviation, it is important to ask how far this law has

actually worked towards realisation of its projected goals of uplifting the powerless in securing for themselves labour and social justice. Ironically, most labour law research in India is doctrinal; hardly any empirical accounts of labour law in action are available. Even law and society research in general has not made any advances [Baxi 1988; Dhavan 1989]. Also, most labour law scholars have used hortatory and instrumentalist arguments, often failing to distinguish between symptoms and causal roots. In order to make law an effective tool of poverty alleviation, it is necessary that lawyers study law in conjunction with social sciences. Justice Brandies has gone to the extent of saying that a lawyer who has not studied economics and sociology is very apt to become "a public enemy" [Clark and Wedderburn 1983: 30]. The working of the legal system is often presumed by law scholars, without demonstrating it. We need to understand the dynamics of the concrete processes through which conspiracies are engineered by vested interest groups to allow labour to remain impoverished. This necessitates a socio-legal explanation of legal concepts, institutions and mechanisms. Very few studies in India have focused on labour law sociology [Saini 1999; Ramaswamy 1984]. No understanding of legal working is possible "without a consideration of where power lies" [Kjønstad and Wilson 1997: iii] and without appreciating that implementation of law is a process in which dominant political values are subtly imbibed. Sociologists of law have emphasised that most disputes in societies and organisations "arise out of power differential" [Edelman et al 1993]. It is intriguing to note that often the societal interests which ask for passage of certain social and labour laws collude to neutralise the realisation of these very goals [Saini 1995a]. Baxi (1995 and 1994) charges the Indian state of being a saboteur of labour laws. Technically though, the unorganised labour can use the protective framework, but the

legal system so works that it does not command enough political power to do so. It is not suggested that effective legal action has no limits; but the important question is, can these limits be moderated to enhance the political power of labour – especially unorganised and semi-organised.

This paper attempts to understand the working of labour relations law framework related to labour organisation and labour dispute processing as it stands structured in the Indian political economy. It answers questions, among others: what does the working of the labour relations law actually reveal; what institutional processes and what forces exacerbate the neutralisation of labour empowerment; what role does the state and its agencies play in securing or denial of labour justice; who eventually benefits in the exercise; what concrete manifestations of labour-disempowerment processes are visible. It suggests, how the labour disempowerment process can be stopped to operationalise the constitutional projections. Many answers to these questions are based on findings in a larger research [Saini 1999], which involved reconstruction of 33 collective labour disputes (listed in Table 1)² belonging to private sector. Of these four cases were live conciliation cases (Nos 30 to 33) in which the author had participated. Most of these related to smaller- and medium-sized establishments where workers were organised or semi-organised. This research represents the first comprehensive analysis of the working of the Indian labour adjudication model.

II

Legal Framework of Social Justice

The Constitution of India – the super-ordinate law of the land – guides all legislative, executive and judicial actions in the country. In its preamble, the Constitution seeks to secure to the people, among others, “justice, social, economic and political... and liberty of thought, expression...” Article 19 (1) (c) of this *grund norm* guarantees to all citizens a fundamental freedom “to form associations and unions”. Part IV of the Constitution is titled ‘Directive Principles of State Policy’, which are directions to the state to operationalise a scheme of social justice and upliftment of the downtrodden guided by the basic postulates of welfare state.

Article 38 (1) directs the state to strive to promote the welfare of the people by securing and protecting as effectively as it may a social order in which justice social, economic and political, shall inform all institutions of the national life. Article 39 ordains that “the state shall, in particular,

direct its policy towards securing – (a) that citizens... have the right to an adequate means of livelihood; (b) that the ownership and control of the material resources of the community are so distributed as to subserve the common good...; (d) that there is equal pay for equal work...” This chapter of the Constitution also obliges the state to provide for: right to work (Article 41); just and humane conditions of work and for maternity relief (Article 42); a living wage, and conditions of work ensuring a decent standard of life (Article 43); and participation (through legislation or otherwise) of workers in the management of industrial organisations and establishments (Article 43A). The directive principles are considered so important that they have been described as the “soul of the Constitution” [Dhavan 1989:xxii].

Premised in the framework of the directive principles, the four main branches of labour laws in the country provide a large number of central (federal) labour statutes. These laws can be classified into: labour relations; wages; social security; and conditions of work. Labour being a subject in the concurrent list of the Indian Constitution, the 25 states and seven union territories of India have in some cases enacted their own labour laws over and above the central laws to suit local situations and power realities. Central and state labour enactments in the country add up to more than 200. In fact, India is being viewed as a society where labour is over-protected through law. Despite that, the cases of labour law violation are many; so much so that often when one sees the working conditions of the unorganised labourers, it appears as if no labour law exists for them [Saini 1998; 1999; Patel and Desai 1995].

The most crucial aspect of labour laws in any country is the labour relations law. This branch of law enables labour to organise and struggle to secure social justice by striving for a just sharing of organisational gains. In this regard, the Trade Unions Act 1926 (TUA) and the Industrial Disputes Act 1947 (IDA) are the key labour relations laws in India enacted by the central legislature. These are over and above the guarantee provided by Article 19(1)(c) of the Constitution, which envisages provision of union rights in general. The TUA is an important legal document, which provides for union formation in industries. Its provisions relate to conferring corporate status on unions, registration of unions, and their rights and obligations. Strangely, however, provision for union recognition was made in the TUA by way of amendment in 1947, but

this has not been enforced till date. Today, recognition can be gained by a union only through show of its strength.

The IDA, like the TUA, applies to the whole country. It provides a model of conciliation, arbitration and adjudication of both rights (individual as well as collective) and interest disputes. This is a colonial law, which was enacted in April 1947. The IDA envisages compulsory adjudication of industrial disputes when parties fail to agree and the government so decides. The genesis of compulsory adjudication in India lies in Rule 81-A of the Defence of India Rules (DIR), which were promulgated by the British Indian government during the second world war in 1942. Through this rule, the government provided for maintaining industrial peace by restricting strikes and lockouts and through compulsory adjudication of industrial disputes. Even though compulsory adjudication was initially intended to be only a war measure, the government, however, formalised it in a more comprehensive form later, by enacting the IDA. Leaders like V V Giri (later president of India) wanted the IDA to be replaced by a law that would promote bipartism and strengthen unions. The ruling Congress Party, however, found the IDA a useful instrument of containing or suppressing conflict. The IDA has now worked for more than half a century and has promoted state paternalism leaving unions weak and susceptible to bureaucratic inertia and manipulations.

The IDA envisages a dispute prevention and resolution machinery, which mainly consists of joint committees of labour and management (works committee); conciliation officers who are government officers (without any autonomy from the government framework); and labour courts and tribunals, which are adjudicatory bodies. Unlike most labour courts and labour tribunals in western countries which are manned by many persons,³ adjudicatory bodies under the IDA are manned by one judicial person only. These bodies are not bound by the civil procedure law and the evidence law in their process of investigation and settlement of industrial disputes. Nor are they bound to wear any formal dress like judges in normal courts are. In reality, however, they follow court-like procedures, thus indulging in adversarial and not inquisitorial investigation and settlement of industrial disputes [Saini 1994]. Labour courts mainly adjudicate rights questions like dismissal whereas tribunals adjudicate mainly interest questions such as wages and allowances.

The disputant parties cannot activate jurisdiction of the adjudicatory bodies at will; the appropriate government—central (federal) and state governments in their respective jurisdictions—has the discretion of referring or not referring industrial disputes to these bodies. They cannot resort to strikes/lockouts when a dispute is pending before an adjudicatory body or during the period in which awards of these bodies are in operation. In fact, there are hardly situations when parties have the freedom to strike/lockout. It is rightly commented that the law of industrial disputes in India is so framed that a legal strike is nearly impossible [Ramaswamy 1984], especially if the state so desires. The government in its discretion also has the power to prohibit strikes/lockouts that are in existence when disputes related to these have been referred for adjudication. The enforcement of the awards of the adjudicatory bodies as well as settlements, if not implemented by the party concerned, is the duty of the labour department created by the central as well as state governments in their respective jurisdictions.

The IDA prohibits the representation of parties at conciliation through practising lawyers; however, lawyers are allowed to appear before the adjudicatory bodies with the consent of the parties and the leave of the labour court/tribunal. In actuality, a large number of labour lawyers, union leaders and management consultants represent parties before adjudicatory forums. This culture has promoted "legalism, consultationism, and government unions" [Bhattacharjee 1988: 212]. Due to widespread presence of the IDA in the dispute process, a large number of trade union leaders are running consultancy services for workers by representing them before these bodies; in actuality, they have become brief-case union leaders [Saini 1995b], and hardly involve themselves in the labour organisation process.

In case a settlement of the dispute is arrived at during the course of conciliation proceeding, the conciliation officer (CO) is obliged to register it if he considers it 'fair' and 'amicable' under section 12 (3) of the IDA. Such settlements are popularly known as 12 (3) settlements. These settlements have wide-ranging application and even bind those employees who are not parties to them—and also those who join the organisation later, during the period such settlement is in force. But a voluntary settlement under section 18 (1) of the IDA binds only the signatories to such a settlement. Hence both parties desire to go in for conciliated settlements—management for their undisputed applicability,

and workers thinking that 12(3) settlements are more proper and legal. If conciliation exercise results in failure, the CO writes a failure report, and sends it to the appropriate government, in which he states his own assessment of the dispute. The CO is also supposed to write a confidential report suggesting whether in his opinion the demands of workers or part of them should be referred for adjudication. The government often bases its reference⁴ decision on the recommendation of the CO, though it is not bound to do so. Thus, the conciliation system is intimately intertwined with the adjudication system.

The powers of the COs appear small as they cannot impose their own views on the disputant parties. But the working of the IDA shows that these powers have been abundantly misused for corrupt or ulterior motives, many times guided by personal pecuniary interest of the CO or at the instance of the political executives under whose overall direction they work [Saini 1999]. The COs also act as labour officers with duties to enforce awards and settlements under the IDA and the employers' obligations under other labour laws. This, of course, happens in other non-western situations as well [Hanami 1980]. Even though COs can intervene in any dispute only if they desire to do so; but in actual practice, they routinely conciliate in all individual and collective (rights as well as interest) disputes. The IDA provides that the parties are free to choose voluntary arbitration of their industrial dispute—both rights and interests—but they can do so before the dispute is referred by the government for adjudication. Collective bargaining as well as arbitration of industrial disputes take place in the dense shadows of the adjudication system. The IDA provides certain protection for union members against dismissal and change in their service conditions during the pendency of disputes before any of the authorities, but this protection is grossly violated by employers. The 1982 amendment to the IDA imposed time limits within which adjudicatory bodies must make their decisions. While referring a dispute for adjudication the government specifies the period during which a dispute is to be decided by an adjudicatory body; in case of individual dispute this period shall not exceed three months. These provisions have loopholes which lead to delay. In actuality, adjudication of collective demand cases have taken on an average 37 to 49 months, which causes tremendous disappointment to workers [Saini 1992; Upadhyay 1995].

III Conciliators, Bureaucracy and Disempowerment

As we noted, conciliation and adjudication are the two key sub-systems provided in Indian labour relations law. These are deeply intertwined. The former is the invisible stage of the latter, because the government's decision on which labour cases are to be referred for adjudication has its genesis usually in the outcome of the conciliation proceedings. Saini's (1999) study, however, locates alternative structures operating at the covert level, which explain the actual working of the conciliation system. The key assumption in a conciliation process is that a conciliator is a neutral third party to ensure 'fair' and 'amicable' settlement. However, Saini (ibid) finds that this power is variously exercised: merely symbolically (Case No 30, FIL); or fraudulently (Case No 32, KGK and Case No 22, HPL); or even involving tyranny on labour (Case No 33, PSL). All these cases involved weak unions, some wanting to remain in power with collusion with the employer and others wanting to represent the genuine voice of the hapless, semi-organised worker. Those in the former category mostly had the patronage of the ruling political party. In KGK (32), the case involved two unions, the recognised one having tacit understanding with the management. The rival union's support rose to 90 per cent of the workforce. It sought recognition by asking for negotiation of its demand charter. But the CO used his 12(3) power to see that the settlement was signed with the minority union. The CO neither investigated the dispute nor ensured the 'fairness' of the settlement. His decision allowed the corrupt union to continue with support of barely 10 per cent workers. The daring and the cavalier way in which the CO signed the 12(3) settlement with the knowledge of his entire staff demonstrates the impunity and frequency with which such frauds can be practised. The CO did administrative manoeuvring to project a facade of legal form. The majority union could have challenged the settlement in the high court, but they did not do so due to several factors including: the union's vulnerability, police and bureaucratic repression, and workers' acceptance of the outcome of the case as their nemesis. The CO had been bribed and was favouring an illegitimate work-group. But more important than that was the fact that the recognised minority union was an ally of the political party in power. In the case of smaller- and medium-sized unions, COs are often found

favouring unions affiliated to ruling parties.

In PSL (33), the CO concerned was acting on behalf of the state chief minister. This case file corroborated horrendous tales of the repression of the union by the state. The employer used the weapon of the sack on 40 activist workers of the majority union, which had a mass support and had demanded recognition. The conciliation and labour administration power in this case were exercised tyrannically, which shifted the union agenda from recognition to protecting the dismissed workers. This happens in most situations of nascent labour struggle. This also happened in HPL (22), which led to disastrous consequences for labour movement in the whole region (i.e. Faridabad Industrial Complex in Haryana). In this case the CO committed a KGG (32) type of fraud on a majority union which created a bloody situation, ultimately resulting in police firing, in which eight workers died. The workers of HPL (22) have not yet recovered from the trauma. They had seen a demonstration of repression by state power. Even though HPL employs 800 workers, it does not now have a union.

A strange kind of fraud was noticeable in SEW (28), where the CO showed a false 12(3) settlement in the records. He used this as a base for a recommendation in the CO's confidential report that "in view of the settlement which is in operation, the case may not be referred for adjudication, but be filed". Interestingly, in this case the activist-workers of this small establishment wanted to derive power through reference and not bargaining.

A reading of the confidential files also showed that the CO had recommended reference of cases on extraneous considerations in many cases. Since these recommendations are confidential, they have remained an untapped source to labour researchers. In fact, it is felt that it is impossible to gather hard evidence on the abuse of the adjudication system [Ramaswamy 1984: 166]. Nearly in a quarter of the 38 cases, COs admittedly rejected reference for corrupt motives (as admitted by managements).

It is noticeable that the conciliators have not done their duty well to ensure that parties enter into 'fair' settlements. Rather, they have allowed themselves to be used to disguise a corrupt alliance between vested interest groups. Labour, therefore, cannot hope for fairness in settlements from just the favourable attitudes of the COs. The alliance is too internalised to be disturbed. Whenever spontaneous protests emerge against injustice, the alliance works to silence them through the institutionalised

channels covertly designed as a part of the IDA (peace) model, which instead of administering social justice helps the alliance carry out its vested interests. This also shows, as observed by Dhavan (1989), that over the years the Indian state has been directly or indirectly privatised for the use of some sectors of the political economy and to the exclusion – or partial exclusion – of the other sectors. It thus becomes doubtful whether a bureaucratic model like the IDA can change the future of Indian labouring masses.

As Dhavan has pointed out, bureaucracy has contributed to corrupting the institutions to a point where they could not deliver substantive justice in the Indian political economy. This has led to the emergence of privatised interest groups in various parts of the political economy, which the economists describe as rent-seekers.

It is not just in developing countries but also in the advanced systems that bureaucratic models suffer from serious lack of potential as instruments of social justice dispensation. Bureaucratic systems are known to suffer from the following:

Overdevotion of officials to precedent, remoteness from the rest of the community, inaccessibility, arrogance in dealing with the general public, ineffective organisation, waste of manpower, procrastination, an excessive sense of self-importance, indifference to the feelings of inconvenience of citizens, an obsession with the binding authority of departmental decision, inflexibility, abuse of power, and a reluctance to admit error [Encyclopaedia Britannica 1987:342].

Bureaucratic power in labour relations is used in several ways: ensuring enforcement of awards of tribunals and settlements; recommending reference; prohibition of strikes under section 10(3) of the IDA; use of police force in containing workers' protests against unfair exercise of this power. A review of the reference decisions reveals that in nearly 90 per cent of the cases the reference decisions favoured the unions affiliated to the ruling party federations [Saini 1999]. This is, of course, not to deny the merits of these cases. But the same did not happen in the case of labour wings of the opposition parties. Biased exercise of discretionary power was also noticeable in case of use of strike prohibition power under section 10(3) of the IDA. In six out of the 30 disputes that involved reference, the 10(3)-power was exercised. Strangely, in all the six cases, 10(3) was used where unions involved were union wings of the opposition parties. In many similar cases

where ruling party unions were involved this power was not exercised, even though worse circumstances prevailed.

Some scholars have observed that state is pro-management in matters of determination of capacity to pay, but is pro-worker in matters relating to termination [Ramaswamy 1984]. Saini's (1999) study, however, shows that it is not really so. It is noticeable from Table 2 that in 18 cases out of these which involved termination, the workers concerned were not taken back; and this happened even in some of those cases where the workers concerned won at the Supreme Court level. In many cases, unions involved were allies of the party in power itself; but they could not secure reinstatement. For example, in HPL (22) police firing left eight of the nearly 5,000 workers, protesting against state repression, dead. The case eventually ended in a settlement after nearly one year of the firing incident. Under the settlement 355 striking workers were treated as terminated and only 80 strikers were taken back by the management on getting humiliating assurances from them that they would not strike again. After all, we all try to minimise our frustrating experiences [Jetswari 1980-81]. That was why the striking workers sighed that settlement, which in fact was entered into in the presence of the district administrator, the state labour commissioner, and the conciliation officer. Interestingly, the ruling party in the state at that time was Congress; and the union involved was also its ally. Still, they could not secure the help of the ruling party, and protect the interest of the labourers.

Thus, as Saini's (1999) study shows, state and management alliance is stronger than that between state and ruling party affiliated unions. This study showed that wherever a union tried to show its independent status, it had to undergo the wrath of the management. The state has endorsed disciplining process of managements with phenomenal lawless methods, both by remaining a mute witness and even by active abetment. It never enforced even the symbolic protection available to unions by way of prosecution of managements for unfair labour practices (ULPs). Not a single case of such prosecution was noticeable, whether or not unions involved were allies of the party in power.

Another important area for action by labour bureaucracy is in ensuring reinstatement of dismissed workers as per court directions. Most such cases in small and medium organisation are settled for money; despite awards in workers' favour, not even 1 per cent of reinstatement awards is the worker concerned actually taken

back. In AMT(5), reinstatement not come even after the Supreme Court's judgment in the workers' favour. When asked the reason for it, Dharam Pal, a clerk in the state labour department, revealed that in such cases the labour inspector concerned becomes a consultant to the employer on how not to implement the award. It is noticeable that the labour bureaucracy plays a significant role in perpetration of ULPs by employers and in eventually smashing the unions. Those who indulge in unionism must know through the narration of these cases what it means to undertake union activities.

One may argue that those employers who have no political clout too suffer in the process. There is no controversy over the issue, and it is admitted that they do. Such employers too have to resort to questionable practices in the process of bringing peace through nefarious means including bribing, and are compelled to do so. But they have the softer option of colluding with the labour bureaucracy and/or the political executive. Small employers too lament the presence of corruption in the labour adjudication system. But eventually, it is they who benefit by preventing union sustenance. Ample evidence to this effect is available in regard to a large number of cases which are abandoned by workers at the tribunal level [Saini 1999].

IV

Juridification and Disempowerment

Since labour relations are continuing relations, the literature underscores a mutual desire on the part of parties concerned to sustain this relationship, which often is described as analogous to familial relations. Labour scholars often caution against giving a dominating role to law or lawyers in it. Such legalism restricts the rule-creating potential of the actors involved in the exercise. The IDA's restrictions on professional lawyers in representing the disputant parties at the conciliation and tribunal levels reflect this apprehension. Juridification implies a process by which legal intervention produces a tendency to distinguish between lawful and unlawful, and attempts to categorise all actions into these two possibilities [Clark and Wedderburn 1983:188; Saini 1991].

The working of the Indian labour relations model produces tangible manifestations of these very apprehensions coming true. Despite experiencing disappointment, workers and even managements believe in the inevitability of the IDA; and the possibility of developing alternative structures is ignored. Juridification

conditions parties' behaviour when workplace issues are debated and negotiated. Employers may not disapprove of this happening as it proves to their advantage. It helps them prevent the powerless from uniting for struggle. And when they feel that labour is not prepared to become an immediate victim of it, which would be reflected in its greater alienation and thus inefficiency, juridification again helps the employers, as they indulge in bilateral haggling under its shadows. With the sword of adjudication hanging over labour, prompting it to acquiesce settlement on management's terms, workers are prone to give in.

The large scale presence of consultationism through lawyers and briefcase union leaders in the Indian labour relations context further reinforces juridification. Saini's (1999) study reveals that 90 per cent disputes at the conciliation stage and 86 per cent at the tribunal stage involved representation of workers by outside leaders. And, 45 per cent of management representatives at the conciliation stage and 97 per cent at the tribunal stage were outside management consultants or practising labour lawyers. It is axiomatic that the working of the IDA model cannot be thought of without a tremendous incidence of lawyering; for, the propriety of parties' action is determined through adversarial procedures. Given the fact that "the ingenuity of lawyers is endless" [Wedderburn 1971: 8], it influences the attitudes of employers and unions produce towards labour law and law administering institutions, and eventually workplace labour relations. The system thus radiates impressions, through the professionals, that justice can be administered exclusively through state created formal bodies. This projection is not just on account of the fact that these bodies proclaim authoritative determination, but also because professionals' personal pecuniary interests are promoted by this approach, even as this leads to the marginalisation of labour power.

Lawyers are "traditional elites" [Abel 1973] and "repeat players" [Munger 1990:604], having own interests and stakes in dispute outcomes. They exert significant influence on shaping the transformation of disputes. In the labour relations context, their interests are often antithetical to those of the disputant parties, especially the weaker ones. It is simply for this reason that practising union leaders enter into alliances with employers and the state to serve their interest. Saini's (1999) disputes' reconstruction demonstrates ample evidence of their dubious role in the union

smashing or weakening exercises of managements. This has led to union avoidance. These manipulations of professionals have become accepted business practices in the never-ending labour juridification process. The above study also reveals that in a small industrial town, the INTUC (Indian National Trade Union Congress) union federation, has 11 factions where each of these leaders is running labour law practice in the name of INTUC. Many of these leaders are not even on talking terms due to the exigencies of competitive business. One such leader remarked: "Our role as pleaders is so absorbing that there is no time for organisational work." The juridified atmosphere has its impact on the efficacy of the personnel managers too. Those personnel managers who do not have knowledge of law are believed to be unsuccessful. Interestingly, despite appointing legally qualified managers when a case goes for adjudication the management's tendency to engage a professional labour lawyer is still very strong, for the jugglery which lawyers can produce in courts is beyond the imagination of these legally qualified managers.

The weakening of unions by the juridification process is further reinforced when to it are added high incidence of unfair labour practices (ULPs) by the employers, and terminations by them for trade union activities, and the inability of the labour relations system to see them reinstated (Table 2). The processing of industrial conflict through legal channels has directed the labour power in India into thousands of individual cases and questions. Presently, 4,47,195 labour cases are pending before various labour courts and tribunals in the country,⁵ most of which are individual termination cases, including those for participating in union activities. Feeling marginalised due to the union-disempowerment process, one of Saini's respondents (a union leader) remarked:

It is difficult to fight management power. I think strike is bad. It destroys the worker. We do not believe in militancy. Even if we get less than what is just, we accept that without fighting violently for the just.

Instead of empowering unions, the peace model thus empowers the dominant employers to intimidate labour and keep them away from the political process of realising industrial justice. Nader, a legal anthropologist, referring to such a use of law, rightly remarks:

In industrialised nation states, the wealthier members of a society override and superimpose their views on the poorer, less powerful sectors by means of the law. In the developing nations, law will play a

great part in this determination because the law is fashioned to legitimate the status quo.

The working of the labour relations law and the juridification produced by it reinforce such perspectives. Therefore, any discourse on the use of law to combat poverty and powerlessness has to begin from this starting point, otherwise it is likely to be hortatory and platitudinous.

V

Tribunals and Labour Marginalisation

When the IDA was enacted, it was expected to provide a forum for promoting peaceful labour relations and minimising industrial conflict. It was also thought that awards delivered by them would enable unions to derive countervailing power, which is more necessary in political disputes such as interest questions in labour relations.

It was expected of these quasi-judicial bodies to provide: greater accessibility to the weaker side; more informal atmosphere than that created by the civil court culture; the use of specialist's skills of the labour adjudicators; and expeditious dispute resolution by minimising delay. These objectives become more relevant especially in interest dispute resolution; they have been accepted even in the UK in relation to tribunal adjudication there, which mainly adjudicate rights questions [Olney 1997]. If the tribunal framework can promote these objectives, that would surely aid the powerless unions in securing a more equitable sharing of organisational gains. Ironically, however, even the British experience has been reported to be not-too-encouraging in this regard [Dickens et al 1985]. The Indian scenario is much worse, being close to total denial of any of these.

Accessibility of labour tribunals is surely perceived by the actors, but perhaps it is because of their narrow definition of this term. So as to be labelled as accessible, adjudicatory bodies must demonstrate and promote the following expectations: the knowledge that a forum exists where dispute processing could be sought; perception that there are reasonable chances of success by activating that forum; bearable costs in processing of the dispute in terms of time and money; closer geographical location of the forum; availability of competent representatives to plead the case of the party concerned; perception that the weaker party (mostly the workers) will not be victimised for espousing a dispute; and in the Indian context of the IDA, getting a successful reference of the dispute.

Since getting nominated to labour tribunals is low on the priority of judges, a large number of vacancies always remain in almost all the states in India, which reduces accessibility. As shown by Table 2, the system does not ensure union leaders espousing the disputes that they will not be victimised for doing so. It shows that in only three of the 21 cases the dismissal action was withdrawn by the management. Interestingly, in two of the 18 cases, the workers could not be reinstated even after the Supreme Court of India found their dismissal wrongful and gave its decision in the workers' favour. The employers concerned in these cases indulged in ULPs to see that the decrees of reinstatement remained unimplemented.

Accessibility is further impaired when the tribunal output results in a high incidence of disputes abandonment by the powerless workers. In Saini's (1999) study such cases were 40 per cent of the total. Even though the dispute statistics shows that peace has been recorded in these cases, it tells nothing about the circumstances which led to such a finale. In fact, these cases involved complete smashing of unions, and the tribunal put its seal of

approval on their demise when nobody responded to the call of the tribunal to appear before it on the appointed date, and the tribunal gave a 'no-dispute' award. In this study, 35 per cent cases resulted in settlement leading to 'settlement awards' by the tribunal. A large number of such cases also tell the story of the vulnerability of the downtrodden in the labour relations process where labour submitted itself to the wishes of the powerful after it felt humiliated by the commission of ULPs by the employers and the inability of the tribunal to protect it. Can we then say that the tribunals have demonstrated accessibility?

The IDA confers freedom on the tribunals to innovate their own procedures in dispute processing. It is provided that they are not guided by the civil procedure and the normal evidence law. Thus, they were expected to minimise the use of jargon and promote inquisitorial and not adversarial style of dispute investigation. They also do not have to wear a judge's dress which too promotes formalism. In order that tribunal proceedings become extended collective negotiations, tribunals need to promote relaxed hearings which

TABLE 1: LIST OF RECONSTRUCTED DISPUTES

Case	Abbreviated Name of the Dispute	Name of the Organisation**	No of Workers
1	HSI*	Highclass Sheets Ltd	1400

Notes: * Cases in which services of union leaders were terminated in relation to the labour dispute.

** The real names of the employers have been changed and pseudonyms are being used, to conceal their identity, as promised.

Source: Saini (1999).

must also be so perceived by the disputants. Surely, compared to civil courts they have promoted informality; but because of their training as judges, they are more or less following the civil procedures and the evidence law. This is exacerbated by the fact that all tribunals suffer from work overload. More importantly, however, interest dispute processing is a matter of political decision-making; formalism becomes a hindrance in this process. Though the IDA provided that the tribunals could make use of two experts for comprehending a dispute, evidently to promote expert investigation and minimise legalistic interpretations, such expert assessors have rarely been sought or appointed.

From the workers' point of view, especially the downtrodden and powerless, probably the most important expectation from the tribunal is expeditious handling of disputes without delay. As noted earlier, the period of delay is so high as to virtually deny the benefit of tribunal adjudication. Delay is caused by the juridifying atmosphere in the ambience of which the tribunal functions. Despite fleeting manifestations of governments' concern, no one has taken concrete steps to restructure this labour relations model. This indifference is becoming more prominent in the new era of globalisation, which has relegated social justice agenda to the background. Baxi (1988, 1994) looks at

this problem as a wider crisis in the Indian legal system. He charges that justice dispensation is a low national priority on the state agenda. Consequently, it has led to situations where the labour adjudication system is used by the powerful actors to see that their adversaries watch their doom in conciliation proceedings and adjudication procedures. Surely, the delay question impoverishes labour struggle. Union leaders who become victims of the management's power of sack cannot wait for years together for justice, that too to see that the tribunal confirms the dismissal order on a technical interpretation or delivers an award which the labour bureaucracy cannot implement.

TABLE 2: CASES INVOLVING TERMINATION OF WORKERS DUE TO PURSUIT OF UNION ACTIVITIES

Name and Case No	No of Workers Dismissed/ Suspended	Whether Union is Ally of Party in Power	Reasons for Termination (Real)	Whether Taken Back	Remarks
HSL(1)	2 union activists dismissed	Yes	Violence during strike	No	Lost at tribunal
HCL (3)	6 union activists dismissed	Yes	Inciting strike	No	In a settlement were treated retrenched without getting any notice pay
AMT (5)	47 union activists dismissed	Yes	Inciting strike	No	In a settlement treated retrenched without notice pay
JSF (6)	8 union activists dismissed	Yes	Without enquiry - for espousing the dispute	No	Were paid money to leave the concern
APL (9)	1 worker and 2 union activists dismissed	No	Union activities - under the false pretext of closing a section where they worked	No	One settled and left. Two fought up to the Supreme Court and won. But were made to resign after receiving compensation.
ASL (10)	8 union activists dismissed	Yes	Union activities, on frivolous charges of beating a worker one km outside the factory	No	Managing director initially assured to take them back, but later on hacked out. Case referred for tribunal adjudication. Was lost due to no proof of proper espousal.
HVG (13)	6 union office-bearers suspended	No	Inciting go-slow	Yes	Taken back as per a settlement.
EL (14)	2 union office-bearers suspended	Yes	Espousing demands	No	Referred to tribunal. They settled and left.
RVL (18)	3 union office-bearers suspended	No	Inciting workers to participate in bandh against IR Bill, 1978	No	Two settled and left. One went up to tribunal and lost there.
OEW (19)	5 union activists suspended after reference, later dismissed	No	Espousing dispute	No	Settled their account and made to leave.
SKW(20)	17 union activists suspended	No	Inciting strike	Yes	After the dispute was referred and strike prohibited, workers came back to work, and in the package suspended workers were taken back.
HPL (22)	46 activists dismissed	No	Union activities	No	After nearly one year of strike, were treated retrenched without notice pay + 330 more strikes treated similar.
UCB (23)	8 union leaders dismissed	No	Union activities	No	Settled their dues and left.
CEW (25)	4 union activists	No	Union activities	No	Settled their dues, and were made to leave.
OS (26)	2 union leaders dismissed	No	Union activities	No	All workers resorted to 103 days strike. Strike prohibited, case referred. Lost at tribunal.
ERF (27)	3 union leaders dismissed	Yes	Union activities - but charges of theft levelled	No	Made to leave and take dues.
FAP (29)	6 union leaders told to leave	Yes	Union activities	No	Management paid Rs 2,000 to each to leave.
KGK (32)	80 HMS activists suspended 23 dismissed	No	Union activities	Yes	Suspension of 80 MW revoked. 5 had left; 18 who were contesting at tribunal taken back on condition that they will support the INTUC union.
SL (30)	6 workers suspended	Yes	Union activities	No	As a package deal made to leave and settle dues.
PSL (33)	40 workmen suspended	No	Union activities	No	4 settled and left, 36 contested at tribunal.

Source: Sami (1999)

Even as the tribunals have failed to live up to their projected goals, their legitimating role is substantial, and thus is their role as a source of power. Saini's (1999) disputes reconstruction have shown that major gains through the tribunal rarely come to the workers. It was only in one case (PML, 8) that it happened. But here too the employer appealed in the Supreme Court and as the workers were getting worn out, the management managed to extract a settlement from them on terms less beneficial to the workers than awarded by the tribunal. Due to these experiences, the worker in general avoids the tribunal. In most cases where new unions are involved the managements collude with outside union representatives at some stage of the dispute processing, which also results in the dismissal of the internal union activists. Sometimes, the latter are also taken into the alliance. The union is thus wiped out or becomes very weak, and the will to revive the labour struggle gets dampened or even extinguished. Most of the cases of dispute abandonment at the tribunal or their settlement at some stage of the tribunal proceedings experience this conscious labour disempowerment exercise.

Despite its severely debilitating impact on collective bargaining and, consequently, on labour, the adjudication system is fully entrenched in the Indian labour relations, and has integrated trade unions into the state apparatus. The responsible trade unionism preached through the IDA, thus results in their getting wiped out or crippled. A large number of those who use the tribunal system are the first timers who see their doom in this model and decide not to use it again. Thus, the grist in the tribunal mill is a new union, which has yet to see in adjudication its nemesis. Strangely, however, even militant national union federations like the Centre for Indian Trade Unions (CITU), which is the trade union wing of the Communist Party of India-Marxist (CPI-M), have become so accustomed to the system in which they worked so long that they have not put forward any major challenge to its existence. It is rightly remarked that "a bird born in the cage cries for the cage" [Sengupta 1989]. In fact, the National Commission on Labour (NCL) 1969 had recommended conferring autonomy on the labour dispute processing forums (industrial relations commissions) from the state apparatus. It also wanted these forums to be multi-member bodies with experts supporting the judicial members. However, a meeting of the state labour ministers called by the central government to debate

the NCL's recommendations vehemently opposed any autonomy to these bodies, as it considered labour relations to be matters of law and order. Thus, this put a seal of approval on the status quo.

VI Concluding Remarks

When labour relations get legalised, they are beneficial to those who can develop institutional skills to use them to their advantage. Legalised framework promotes bureaucratisation, and thus enables the government to prevent labour to unite and struggle for industrial equity and democracy. Government's first concern is production and peace at whatever social cost. Consultationism, inherent in the IDA in the Indian context, produces management consultants and briefcase union leaders. They help strengthen opportunistic alliances between various power centres. And thus, they help in making the legal labyrinth more tortuous. The individualisation of labour relations exacerbated by them further disempowers labour.

The Dunlop Commission on Labour Relations, which was appointed to examine the state of industrial relations in the US in the post-Reaganomics era, also reveals a rise in the above tendencies in the US. The commission has estimated that 70 per cent of US employers used outside consultants, and 40 per cent of the workplaces are not able to secure a collective bargaining agreement after winning certification [US Department of Labour 1994]. Personalisation of labour relations also promotes conversion of industrial realities into legal questions. Especially, small and medium organisations show greater tendency for commission of ULPs. Thus, it becomes an instrument of preservation of the status quo rather than bringing any change in the condition of the powerless. Such an institutionalisation of legalism prevents dispensation of substantive justice to the poor; the law is prone to becoming merely a symbolic protection.

Redistribution of power cannot come without struggle and conflict. The IDA model in India has enabled employers to effectively use their political power through the structural contradiction of the IDA framework, as a resource for their own dominance. They used it as a legitimator of the practice of authoritarianism, fraud, and even tyranny on workers seeking redefinition of labour relations. It also enabled them to forge alliances for legitimisation of structures and processes of power dispensation.

Nonet and Selznick (1978) divide legal development into three stages. In the first

stage, the law is described as repressive and is passively and opportunistically in the service of the predominant social and political forces as an instrumentality of coercion. In the second stage of its development, the legal system attains 'formal rationality', which they describe as autonomous law. In this stage, they claim that the law seeks to establish and preserve institutional integrity. In furtherance of this goal, the law "insulates itself, narrows its responsibilities, and accepts a blind formalism as the price of integrity." In the third stage, law again responds to the exigencies of the social environment as it had done in the repressive stage, but this time geared to meet societal needs. Going by the analysis above, the working of the Indian labour relations law shows that it is in the first stage of Nonet and Selznick's legal development. Therefore, it is imperative that any discourse on the use of law as an instrument for combating poverty has to take note of such a role which law plays as a rhetoric and in reality.

The most important instrument of labour empowerment is strong unions, which can organise themselves to match the managerial rationality in organising private industrial governments; juridification and its consequent fallouts counter such a possibility. It creates a labyrinth which empowers labour at one moment only to disempower it at the other. Kjonstad and Wilson (1997: vii) note seven prerequisites for achieving the goal of breaking the vicious circle that links poverty and powerlessness. These are: (1) conducive national constitution; (2) opportunity of struggle provided by tribunals; (3) treating human rights as also the discourse on poverty; (4) possibility of mobilising the poor; (5) perception of danger by power wielders if they deny rights to the poor; (6) mobilising altruism by the powerful; and (7) encouraging non-poor to participate in struggle against poverty. So far as labour struggle in India is concerned, only the conditions laid down by prerequisites (1), (6), and (7) are fulfilled. Others are fulfilled partially or not at all.

In the given situation, can we identify concrete issues in alleviating poverty in the context of Indian labour. The following could be an agenda [Saini 1998] for reforms.

(a) Comparatively, labour standards in India are low. The IDA and the consequent legalism produced has made labour-power weak in its fight for their enforcement. A large part of Indian labour does not get minimum wage. The Bhopal gas disaster tells us of the safety conditions in which they work. The first step that should be

taken is the enforcement of laws relating to these. We need a programme of social action for requisite sensitisation of all concerned in this regard. Intellectuals, NGOs and international trade union movement can play a useful role in this regard.

(b) Any programme of action for enhancing labour power needs to evolve a better enforcement mechanism. Labour needs to be given representation in carving out such an enforcement mechanism.

(c) There is a need for constant monitoring of the implementation mechanism by rights groups at national and international levels.

(d) There is a need for simplification of labour laws, and internalisation of such simplicity as a social value. In India, the National Labour Law Association (NLLA) has come out with such a code. This can be a good starting point for tringing a complete labour law framework to the poor to facilitate their understanding of it. This code also has the agenda for partial de-juridification of labour relations. The Indian government must be made to seriously consider reforms on the pattern of this code.

(e) It is absolutely necessary to ensure autonomy of tribunals and conciliators from the state apparatus. This is perhaps the most difficult task in the Indian context as the analysis in this paper reveals.

(f) There is a need for greater degree of public interest litigation for enforcing minimum labour standards and developing some basic postulates of sound labour relations. It can be a very useful instrument especially in the Indian context. But we need to involve those people who are genuinely interested in poverty alleviation.

(g) In the globalisation euphoria, unionism and collective bargaining as values as also the values of welfare state and welfare economics themselves, are in a deep crisis. Researches in the UK reveal that pluralism has survived there, despite Thatcherism and the fall in the unionisation rate [Storey 1992]. We need wider popularisation of the perspective that unions are not fundamentally antithetical to globalisation philosophy.

Notes

[An earlier version of this paper was presented at a workshop on 'Law and Poverty III: Law as a Tool for Combating Poverty', organised by the Comparative Research on Poverty (CROP) programme of the International Social Science Council held at the International Institute for the Sociology of Law, Onati, Spain from May 19 to 21, 1999. I thank CROP for inviting me to the workshop, and Else Oyen, Lucy Williams, Asbjorn Konstad, Paul Spicker, and Camilo Perez-Bustillo for helpful comments. The usual disclaimers apply.]

- 1 As per *Economic Survey* 1998-99 of the government of India, the Planning Commission's estimate of population below poverty line (for the year 1993-94 which is the latest available) is 320 million, which is 36 per cent of the total population of the country. These percentages for some other developing countries are: China 22.2; Philippines 35.7; Indonesia 11.4; Malaysia 17.4; and Thailand, 8.1.
- 2 In four of these 33 disputes, the author participated in conciliation proceedings. The remaining 29 were sampled from the total of 195 interest disputes handled by the industrial tribunal in a five-year period. The disputes were reconstructed on the basis of records of the COS and the industrial tribunal and interviews of the disputant parties. The sample of 29 adjudicated disputes consisted of: (i) 10 disputes which involved full-blown adjudication; (ii) 12 disputes which were compromised and resulted in 'settlement awards' by the tribunal; and (iii) seven disputes which were abandoned at the tribunal by the workers and thus ended in the employers' favour.
- 3 See, for example, Olney (1997) for details on constitution and structure of labour adjudicatory bodies in European countries.
- 4 The term 'reference' denotes the act of the appropriate government to send a dispute to tribunal/labour court for adjudication. A party cannot approach these bodies directly. Government has the discretion to refer or not to refer a dispute for adjudication (Section 10, IDA)
- 5 As on March 31, 1997. This number also includes cases under section 33, 33A and 33C of the IDA. This figure was obtained from the unpublished records of the ministry of labour, government of India, New Delhi.

New Technology and Textile Workers

R C Datta

This paper attempts to study two aspects of the relationship between new technology and employment in a composite textile mill in Mumbai. The specific objectives are to determine (a) the effect of new technology on employment at a unit level, and (b) the impact of new technology on the nature of work.

Wage rates and jobs are not exactly like other prices and quantities. They are much more deeply involved in the way people see themselves, think about their social status, and evaluate whether they are getting a fair share out of society. Social institutions define acceptable modes of behaviour in the weighty context like the labour market.

— Solow, 1990

The quest for labour security is a legitimate...market mechanisms may need to be circumvented in the interest of social values... Social progress and labour standards should not be sacrificed in the name of efficiency [Standing and Tokman 1991:2].

INTRODUCTION

THE 1990s will go down in the economic history of modern India as the decade of restructuring when global competition, deregulation, privatisation, acquisition, takeover and merger—now familiar horse-men of the corporate apocalypse—rode the business scenario. This decade will also go down probably as the 'lost decade' of development, if development is to be identified as a means to surviving as a state and a society, asserting its national interests in the world economy.

In this new economic environment of stabilisation and adjustment programmes, firms are responding by introducing new technologies and workplace innovations, hiving-off businesses, retrenching workers and cutting costs. These new technologies are supposed to engender economic growth by bringing about increasing levels of productivity, efficiency and profitability. The speed of operation, labour saving, accuracy, product variety, quality of product and reliability are the most distinguishing characteristics of new technologies from the management's point of view. However, major undesirable side-effects of new technology are related to its negative impact on employment and job impoverishment.

Although scholars have been arguing that production of new technology and its positive impact on productivity and economic growth will generate many new

jobs in the long run, whether those jobs will be for the ones losing jobs at present is doubtful. Even Wassily Leontief admits that the emerging so-called knowledge sector will not be able to create enough new jobs to absorb the millions of workers displaced by new technology. He has warned that with the introduction of increasingly sophisticated computers, "the role of humans as the most important factor of production is bound to diminish in the same way that the role of horses in agricultural production was first diminished and then eliminated by the introduction of tractors".

According to a behavioural social scientist: "The historical development of new technology can be viewed as a three face process with a number of intermediate forms. For example, technology may be seen as having progressed from dependent machines (e.g. bucket elevators), to semi-automatic machines (e.g. Jacquard loom) and, finally, to automatic machines (e.g. continuous process technologies). Dependent machines were labour-saving technologies from the workers' point of view. They were generally positively regarded as they eased our physical burden and allowed our intellectual advancement. Semi-automatic devices only required that we tend to their needs. These machines were no longer assisting us. We were, and in many cases still are, assisting them. These labour-enslaving devices require workers to perform semi-automatic tasks demanding little more than reflexive attention. The third phase in this history of technology may be seen from the workers' point of view as the introduction of labour-replacing processes. This technology totally replaces the human element in performing the actual work. It removes the worker from the production process... Unfortunately, this phase also has the potential to devalue workers, undermine their power and skills, and displace many workers from their jobs" [Carlopio 1988]. In fact, even the economic justification of new technology has been questioned by some well known scholars. According to Lester Thurow, senior economist at the Massachusetts Institute of Technology,

industry has not been able to provide compelling evidence that the sought-after efficiency and productivity increase have taken place. Gary Loveman of Harvard University have spoken about the utter failure of the highly touted technological revolution: "We simply can't find evidence that there has been a substantial productivity increase—and in some cases any productivity increase—from the substantial growth in information technology."

Still the fact remains that the new technology is capable of totally replacing the human element in performing the actual work. The worker along with the stages of production process is removed. Workers are devalued, their power and skills are undermined and are displaced from the jobs. The possibility and feasibility of these displaced workers to get absorbed back into the labour market by re-entering the workforce are minimal. According to another well known scholar: "Technology displacement and the loss of job opportunities have affected the nation's (the US) youth most of all, helping spawn a violent new criminal sub-culture" [Rifkin 1995]. Balancing the much touted productivity gains due to new technology with its undesirable side effects in a developing country like India, seems a hopeless 'challenge'.

Typically, economists have analysed the relationship between technology and the economy from the standpoint of firm assuming 'market' relations between management and labour which are based on complete information, enforceable employment contracts, and conflicts resolved mainly by wage bargaining. Herein, management is assumed to make 'correct' technological choices and hire labour at wages dictated by the market reflecting productivity associated with the human capital.

However, it has been well recognised in the more recent research work that the relationship between technology, management and labour is much more complex. The choice of technology and the way it is applied to work is a political economy issue primarily because the purposes of

management/employers are not necessarily in consonant with those of workers. It is true that new technology is introduced by employers to increase productivity, efficiency and profit. However, incomplete information on labour behaviour and incomplete operationalisation of enforceable employment 'contracts' result in less than optimal expectations from the technology from the management's point of view. This 'limitation' is made up by the management – which wants both quantitative efficiency and qualitative efficiency – by using new technology to wrest control over workers' behaviour and speeding up the flow of work.

In this paper, we have attempted to study two aspects of the relationship between new technology and employment in a composite textile mill in Mumbai. The specific objectives are to determine (a) the effect new technology on employment at a unit level; and (b) the impact of new technology on nature of work.

The methodological framework of the study is based on our regular fieldwork in the last few years in the textile mills of Mumbai, where we have attempted understanding the effect of technology as regards employment, nature of work and textile worker. The methodology included: (a) On-site observation of workers on the job on different technologies and stages of production.

(b) Extensive interviews of workers, management officials and union officials, both individually and in groups.

(c) Document inspection including intensive study of union-management agreements over new technology related and other issues over the years.

(d) Understanding of production process and labour process with the help of on-site observation and discussions with supervisors.

RESEARCH ANALYSIS AND FINDINGS

One of the main advantages of new technology is its speed of operation. In spinning, old technology spins yarn at a speed of 17,000 rpm while in the case of new technology the speed of operation is around 1,00,000 rpm. However, the cost of new technology is approximately six times that of old technology. The same is true in the case of weaving. On the old loom technology the weft insertion rate is around 250 metres per minute while with new technology the insertion rate is 1,800 metres per minute. The cost of new technology in weaving also is very high compared to old technology – approximately 10 times more expensive. This cost disadvantage is made up by saving on

labour costs directly and also indirectly by eliminating some stages in the production process.

Let us examine some of these characteristics of new technology in the case of spinning. Table 1 shows comparative data on output and use of labour in the case of old and new technology in spinning. New technology yields a sevenfold increase in output per worker day and drastic decline in labour complement per day. It should be noted that average wage rate also declines in the case of new technology.

Based on this data and some additional information on depreciation and interest rate, we have calculated the cost per kilogram of yarn on old and new spinning technology. This is shown in the Table 2. It is interesting to note that the cost per unit of yarn output is significantly higher in the case of new technology. Capital intensity goes up by approximately 2.5 times which is made up by utilising only 15 per cent of the labour involved in old technology. Power cost goes up in the case of new technology but only marginally.

In Table 3, we have shown changes in capital and labour cost per unit of output in weaving with change in technology from old to new micro-electronics based one. Labour input requirement in the fabric production process declines to 16 per cent. Capital cost per unit of output goes up more than two-and-half times as we move from technology A to technology C. Technology B is much more capital intensive. Labour intensity on new technology has declined to less than one-fourth of its requirement in old technology. And finally, still, the total cost per unit of output as in spinning, has gone up by more than twice.

It is, therefore, not surprising to know that 'retiring' workers voluntarily in this profit-making textile unit is fairly common. When we consider the production process under different technologies, direct job losses are clearly indicated by the elimination of certain stages of production in the case of new technology. With new

technology, simplex-interbobbin stage is eliminated and since yarn is directly spun on to the cheeses from the sliver, winding is also not required. This reduces the labour requirement substantially apart from saving in capital cost and the space occupied by the 'interbobbin' machines.

Elimination of winding (in the case of certain counts) as a stage of production process has drastically reduced the number of women working in the department over the last two decades. However, with the introduction of new technology in winding (in certain other counts) employment of women declined from 46 with 22 badlies in 1978 to eight with nil badlies in 1997. According to the management, high capital investment in new technology requires a high level of machine efficiency (and very low down time) for technology to be economically viable and since the women can work only in one of the shifts, they have been replaced.

Apart from saving labour directly by introducing new technology, there are other workplace practices which can make labour redundant. One of these new workplace practices is multitasking which many a times goes under the name of multiskilling. However, some critics call it work intensification.

TABLE 2: COST OF YARN BY SPINNING TECHNOLOGY

	Old Technology	New Technology
Capital cost	3.97	10.16
Labour cost	3.33	0.45
Power cost	5.65	5.70
Total	12.95	16.32

TABLE 3: COST OF CLOTH BY WEAVING TECHNOLOGY

	Technology (Rs/yurd)		
	A	B	C
Capital cost	2.87	20.11	7.8
Labour cost	0.552	0.134	0.135
Total cost	3.42	20.24	7.94
Labour input (weaver minutes)	1.66	0.356	0.277

TABLE 1: TECHNOLOGY, PRODUCTION AND LABOUR: SPINNING

	Old Technology	New Technology
Utilisation (per cent)	97.3	97.5
Spindles/rotors	32,256	4,560
Average employment per day	248	59
Average wage rate (Rs/month)	4,184	4,040
Output (kg/day)	15,600	26,000
Output/worker/day (kg)	62.9	457.6
Power (kWh/day)	28,500	48,000
Power consumption per unit of output (kWh)	1.82	1.84
Cost per machine (Rs lakh)	0.2	120

The existing work practice in the old shed has been such that 14 looms were operated by one weaver and a battery-filler. Work here is reorganised and redistributed in such a way that there is no separate specialist battery-filler. Every worker, i.e., battery-filler or weaver, is supposed to operate eight to nine old looms and also work as a battery-filler for the looms allocated to him. Since the same two workers now are made to work on 16 to 18 looms, many battery-fillers have become redundant. More than 60 posts of battery-fillers have been rendered surplus to be abolished. In modern management literature this is known as 'functional flexibility'. But, for many of its critics it is labour intensification. Since this practice has generated labour redundancy and the ones becoming redundant are very highly likely to go under 'voluntary' retirement scheme, 'numerical flexibility' is also achieved by the management. Numerical flexibility is in fact, in-built in 'functional flexibility' and either of these results into job losses.

Since the government of India, while giving a 'human face' to the structural reforms, has given income tax exemption on voluntary retirement compensation, it becomes an incentive for the workers to opt for voluntary retirement. Once a unit avails the benefit of income tax exemption on voluntary retirement compensation of its workers, they are simultaneously required to 'abolish' those posts held by workers who have opted for voluntary retirement. In fact, the unit offering VRS often does require more workers. Therefore, a unit may offer VRS to its permanent workers and simultaneously recruit temporary or badli workers who are not only relatively less costly but are also more 'flexible'. Management control and worker flexibilities are working together.

The question is, is the labour market rigid? Does labour legislation act as an impediment? It does not seem so. A union management agreement has been signed on the above-mentioned workplace practice, including voluntary retirement of redundant workers.

THE POLITICS OF NEW TECHNOLOGY AND WORK

The old technology not only had a greater number of workers working with it, in addition the worker also had more control over his labour process. New technology has changed the nature of work.

Typically, in the case of old technology in spinning there used to be a sider whose main job was to piece broken ends, a

doffer-gaiter, a jobber and a helper. Most of their work involved their skills and judgment based on experience on the job. Fixing and adjusting the speed of operation was done manually. Piecing in old technology is a manual function which is done by stopping the spindle by hand using skills acquired out of experience. Spindles were provided with individual breaks so that operative could stop it. Doffer-gaiter used to put empty bobbins and remove the filled bobbins. He was also skilled enough to put thread from the interbobbin.

In the case of new technology in spinning there is no jobber, no sider and no doffer-gaiter. There is an 'operative' whose main job is to put 'sliver' from the 'can' on to the rotor and take care of the machine — keep it clean. There is a piecer 'carriage' and an 'auto-doffer' mounted on the micro-electronically controlled spinning machine. The job of piecing is taken over by the piecer carriage which continuously keep moving over the spinning machine to locate thread breakage and pieces. Empty cheases are loaded manually by the operative. The rest of the work is taken over by the new technology. Only when the 'piecer carriage' fails in piecing, the operative comes into action but only to clean the spinning box. Only piecer carriage can do the piecing. The worker only helps the piecer carriage. Similarly, an 'auto-doffer' moves continuously above the spinning machine and by using sensor it takes diameter of the chease. If diameter is as per requirement fed in the computer programme it removes chease, keeps it on the conveyor — which is moving, and thus automatically gets dropped in a box, which is to be taken to weaving shed most likely by an erstwhile 'skilled' but now 'redeployed' worker.

Finally, insofar as this new technology also provides the means to record fast accurate data related to production, efficiency and performance, it reduces the porosity of the labour process and thus constitutes a direct form of workplace control. A variety of parameters related to machine and man's performance are displayed on a screen by the new technology. This includes production in metres per minutes, running time of machine, number of dolls, efficiency, production expected, cloth length in picks, production in picks, rotor/loom speed, number of piecing operation carried out, and operative's code, etc. Control is built into the technology itself through electronic measurement rather than by elaborate rules, procedures and personal supervision.

WHAT DOES A WORKER DO AFTER TAKING VOLUNTARY RETIREMENT?

As is well known, the government of India, while introducing the structural reforms in 1991, also created a National Renewal Fund to provide a 'human face' to the reforms, which, the policy-makers declared "...will fully protect the interests of labour, enhance their welfare and equip them in all aspects to deal with the inevitability of technological change". Over the last five years thousands of workers have lost jobs under voluntary retirement schemes in the textile industry in Mumbai — both in National Textile Corporation's mills and in private sector mills.

What do these workers do after getting 'voluntarily retired'? Where do they go? Do they re-enter the labour market? What do they do with the voluntary retirement compensation? What are the social implications for the family and community? We have attempted to look into these questions at a micro level in Mumbai (and Maharashtra) by interviewing a sample of workers who opted for VRS in the mills. The main findings of our research in brief are:

- (a) Typically the workers have started working as casual labourers. Some of the VRS workers' wives have started cooking and supplying tiffins to the workers still employed in textile mills.
- (b) Some of them have taken up jobs in the decentralised powerloom sector in Bhivandi, Malegaon and Ichalkaranji.
- (c) Many of the workers have spent the emoluments under VRS in repaying debts and also on the marriages of their daughters. It is not uncommon to observe that the dowry increases the moment a worker gets his VRS money, and quite a few have spent their money in drinking alcohol. In many cases the children have dropped out of school and some of them, along with their mothers, have started working in the unorganised sector.
- (d) It is not uncommon to find a voluntarily retired textile worker looking for work for himself or for his son outside the gate of the same mill within a year.
- (e) Very few workers have kept their money in fixed deposits in banks and some have invested in a house in their village.
- (f) It seems to us that the ones who had retained some links with their villages and the community there (by regularly visiting the village over the years and thus by absenting themselves from the job) are doing relatively better.
- (g) Typically a worker in textiles in Mumbai who started working in a mill as a temporary learner and moved up via

badli years to permanency is back as a casual worker in the labour market in 1990s.

The number of early retirees from the industry in general is increasing and this trend may produce a massive social waste of human potential and thus many people feeling cut off from any useful role in society. In this regard, we would like to mention that if some of the textile workers who after losing the job have gone back to their villages and thus have been able to survive because of their social network/ links with the land, there are quite a few who have not been able to go back and have entered into illegal/criminal activities. Probably this is the price society will have to pay when the firms introduce new technology to increase profit.

CONCLUSION

We find on the basis of mill level data, that the so-called state-of-the-art technology in textile is highly capital and power intensive. The technology is also highly 'labour-displacing' and 'job impoverishing'. The justification for its introduction on the shopfloor is dependent on these very labour displacing and job impoverishing characteristics. The technology also acts as an instrument of workplace power, which the management uses to demystify worker centred skill and to replace human-based processes.

The ones who are made redundant are given 'voluntary retirement' and are displaced. Most of them have joined the unorganised sector as 'new poor'. Some who have been able to retain links with their land in the villages and social network have fared a little better.

In effect, at micro level, our study shows that the unions have not resisted introduction of new technology in the mill and also could not influence the resultant work-reorganisation. The management has been able to vary quantity of labour (numerical flexibility), redeploy labour ('functional flexibility') and also been able to control the cost of labour through the use of 'badli', or temporaries or by offloading work in the decentralised sector thus achieving the financial flexibility also.

[I wish to thank Baguram Tulpule for his valuable help in the calculations and comments.]

India's Foreign Policy and Beyond

Rajen Harshe

India in World Affairs: Towards the 21st Century by Usha Thakkar and Mangesh Kulkarni; Himalaya Publishing House, Mumbai, 1999; pp xiii + 318, Rs 450.

THE edited volume under review is a collection of articles of uneven quality on the diverse aspects of India's foreign policy. After 50 years of independence, perhaps, it is absolutely essential to take a fresh look at India's foreign policy to appraise the changing status and role of India in world affairs. The relevance of such exercise can as well be underscored by the fact that India is trying to find its feet in a rapidly globalising world. Hence any worthwhile analysis of India's foreign policy during the past five decades can provide a useful background to understand the challenges of globalisation in the 21st century. The book, as its sub-title suggests, is an effort in this direction. It starts off with a neatly written and promising introduction from the editors. The book primarily has been written for students and scholars in international studies. To a limited extent, it also represents a quest by scholars to search fresh policy options. Collaborative studies, such as this, in international relations have rarely come out from the areas outside Delhi. Indeed, the growth of international relations studies in India would get stunted if its study remains confined to the Indian capital. In this context, any significant effort to promote international studies outside Delhi has to be welcomed. And, on the whole, this effort is certainly significant because it has offered a reasonably comprehensive coverage to some of the main themes, issues and areas of India's foreign policy. In view of these preliminary observations, we can proceed to capture the efforts at theorising foreign policy in this volume.

THEORISING FOREIGN POLICY

There are two essays, written by A P Rana and Rajesh Basrur respectively, with distinctly theoretical bearing and orientation. In fact, Rana's essay on the relevance of Nehruvian tradition to the post-cold war world is quite reflective. This seminal essay certainly has abundant potentials to generate debates among historians of ideas. Rana, at the outset, shows a clean grip over

the scholarship of traditionalist persuasion in international relations theory. Then he moves on to explore, subtly, the complex dimensions of normative contours that guided the notions of security and shaped India's foreign policy. The choice of the term 'security' in Rana's text has been imaginative enough to incorporate developmental agendas of the developing countries. The most striking feature of this article has been its capacity to reconstruct the entire Nehruvian tradition on the basis of Nehru's speech, delivered in 1946. Rana argues, quite effectively, how systemic good and unit level protection were simultaneously effectuated in the very manner in which Nehru operated India's foreign policy in the then international system. Naturally, this argument robs Nehruvianism of its commonly attributed notion, i.e., the policy of keeping aloof from great power formations. Having released the Nehruvian tradition from the clutches of the most mundane stereotypes, Rana has moved on to apply the essence of his formulation on Nehruvianism to the changing realities of international relations. These realities include the growing asymmetry of power between the north and the south, the emergence of New Northern Concert of Powers and the rise of hegemonies in international relations. Rana shows how going beyond non-alignment is in conformity with Nehruvian tradition. In fact, Nehruvian tradition, according to the author, would allow us to see the systemic challenge of our times both in substantive and real sense in order to find due place for the manifold developing countries of the south in the international society of states. Further, it would also permit us to spell out more sophisticated responses to hegemonies instead of condemning hegemonies with customary rhetorical vehemence. In a word, Rana has succeeded in elevating Nehruvian tradition as a method of thinking while understanding international relations.

Rajesh Basrur has tried to interpret India's foreign policy through a reformu-

lation of neo-realist systems theory by relating varying levels of intensities of interactions among states. It was Kenneth Waltz who made the initial but fairly persuasive statement on neo-realist systems theory in international relations. Accordingly, international relations consist of process and structure. The term process subsumes specific interactions among states such as diplomacy, trade and cultural exchanges while structure is a property of system alone and not of its individual members. Since structure is a dependent variable its role, and even relevance, in any system is invariably shaped by the levels of intensity of interactions among states under given conditions. Basrur has characterised India as a strong state within the subcontinental system and weak state in a global system. With the help of the basic tenets of neo-realism Basrur has analysed India's policy at the sub-systemic as well as systemic levels. This exercise is both innovative and instructive. In addition to these theoretical papers, like all the conventional writings, security issues and relational studies have taken the major bulk of the space in this volume.

SECURITY ISSUES AND RELATIONAL STUDIES

The defence and security issues in India's policy have been tackled competently by Shrikant Paranjpe and Uttara Sahasrabudhe. Going beyond the conventional realist approach Paranjpe has tried to place India's defence policy in a wider framework. This has given him a space to assert that the Nehruvian model was based on the logic of defence through development. As this model received a severe jolt after the Sino-Indian dispute, India played greater attention to the security issues. Some of the significant developments like the first nuclear explosion of Pokhran I (1974) and the development of Integrated Missile Development Programme were by-products of India's changing security concerns. After the 1980s owing to the rise of subversive movements in different parts, building a viable counter-insurgency strategy became an important part of India's internal security strategy. In a thorough and workman like presentation Paranjpe has analysed the role of diplomacy, economy and technology behind India's security strategy. He has also shown the impact of

the policy of economic liberalisation on defence and industrial policy. Uttara Sahastrabudhe's paper on India's nuclear policy is neat and tidy. It offers an unpretentious chronological analysis of nuclear policy.

A number of articles are essentially devoted towards the understanding bilateral relations. These articles have placed India's relations with China, the US, the former Soviet Union, Russia and Canada, in a perspective. Alka Acharya and G P Deshpande have provided a comprehensive account of Sino-Indian ties during past 50 years. Their essay has underlined the reasonableness of the Chinese position on the Sino-Indian border dispute. It has also given useful insights on post-socialist China's foreign policy. Dilip Mohite's article offers a good narrative analysis of the continued security dilemmas of India that emanated from the manoeuvrings in the US foreign policy at the global and regional levels. Shridhar Shrimali has built a logical and neat argument to demonstrate how convergence of national interests coupled with imperatives of defence and development cemented the bonds of bilateral relations between India and the Soviet Union since the mid-1950s, whereas P L Dash's pamstaking piece has brought home the significance of Indo-Russian trade and defence ties with the help of an impressive array of empirical details. John Wood has offered a brief sketch of Indo-Canadian relations with reference to security, trade, investment, immigration and cultural issues.

India's policy has also been reviewed with reference to important regions like south Asia, Indian Ocean, west Asia, sub-Saharan Africa and Europe. Nalin Anadkat makes a fervent plea for India's regional hegemony in south Asia; hegemony based on consent rather than force. Arunachalam highlights the growing geo-political significance of the Indian Ocean and the likely role of India in the ocean. Prithvi Ram Mudium in a critical historical overview of India's policy in west Asia has mounted a scathing attack on unimaginative Nehruvian framework that shaped India's policy towards the entire region. Locating his critique well within the traditions of realist school, the author takes a panoramic view of misconceived perceptions of policy-makers in India on the issues including Kashmir, Palestine and Arab-Israeli conflict. V S Sheth has ventured to trace patterns in Indo-African ties over a long-term historical period while Parvati Vasudevani has underscored the

increasing importance of economic times in the Indo-European relations.

In addition, stray articles appear on a few more themes in the book. For instance, Anand Mavliankar has dealt with the changing economic compulsions behind foreign policy. HC Shukul has offered an account of decision-making process in foreign policy under different political regimes. Lionel Fernandes has reviewed the relevance and contribution of India's non-alignment while Nandini Patel has assessed India's record at the UN. Last but certainly not the least, an essay on India and the information order by Dipankar Sinha has taken a critical view of India's desire to seek integration within the ascendant neo-liberal capitalist order. Keeping the above stated essence of this work in the sight, we shall proceed to offer a critique of this collective endeavour.

A CRITICAL APPRAISAL

In a way, this volume represents a state of the field of international studies in India. Even now, the impact of diplomatic history, as a form of study and writing, is quite considerable on this field in India. Most of the themes have been tackled in this study in the form of narrative analysis. Especially, the relational studies in this volume, at times, are replete with dull and colourless descriptions. It is really a pity that in international relations studies, as they are pursued in India, the form of descriptive chronological analysis continues to hold its uninterrupted sway in the overall literature that is being churned out in the field. The book does not move like a worthwhile enquiry conducted with the help of existing theories, concepts and schools of thought in social sciences. International relations studies emerge in this volume as a field insulated from other social sciences. Moreover, each narrative analyst has been arbitrary in choosing the period of analysis. Thus, Arunachalam's essay shows no inhibitions in moving across centuries while writing on the Indian Ocean whereas Sheth opts to highlight the patterns of Indo-African ties during the past 100 years, in a few pages. More precise and well justified time spans with well thought out and specific issues could have rendered these exercises more fruitful. Apart from this gap in time spans, in some articles, central themes with relevant issues and events do not get correlated in any cogent form. Sometimes bold assertions and prescriptive overtones on the part of the authors tend to hamper a

dispassionate view of the subject. Especially, Anadkat's project of promoting India's hegemony through consent sounds unsustainable.

While thinking about how India is heading towards the 21st century a mention of a few critical gaps in this collection is unavoidable. To start with, the book has offered theoretical perspectives emanating from cosmopolitanism and neo-realism but there is no assessment of India's policy from a Marxian perspective. A sophisticated Marxian analysis of foreign policy could have made the theoretical component of this study well rounded. Second, with the ongoing phase of globalisation, economic diplomacy as well as issues pertaining to economy have started acquiring paramount importance. Articles touching upon major issues in international trade, economic and environmental diplomacy, technology and intellectual property rights in relation to India's policy could have served this purpose. Moreover, the book has related India's policy with several third world regions except south-east Asia. And in the context of the advent of regionalism in the post-cold war world, coupled with growing significance of the organisations like the Association of South-East Asian Nations (ASEAN) in the international political economy, the absence of south-east Asia appears conspicuous in the study. Finally, the borders between domestic and international are getting blurred under the phase of globalisation. Under the circumstances, India's foreign policy is constrained to tackle problems that stem from cross-border terrorism and sub-nationalism. Further, the flow of arms, drugs, and refugees have their impact on domestic as well as foreign policy. Indeed, the forces of globalisation are linking sub-national and transnational actors in queer ways. An article analysing India's foreign policy with reference to different aspects of globalisation could have led this volume, more effectively, towards the portals of the 21st century.

Perils of Government Secrecy

V Balachandran

Secrecy – The American Experience by Daniel Patrick Moynihan, introduction by Richard Gid Powers; Yale University Press, 1998.

SENATOR Daniel Patrick Moynihan has never been fond of governmental secrecy. He has been carrying on a relentless struggle against the cult of secrecy and the activities of the American secret services. As early as 1961 he earned the displeasure of Hoover (who called him a 'Skunk') by writing that the FBI had "successfully stayed away from organised crime", its primary focus. He created a sensation in the early 1990s by calling for the abolition of the CIA and merging its functions with the state department for its failure to predict Soviet Union's demise. He now sums up the result of his lifelong research into the ruinous effects of excessive secrecy in his new book, *Secrecy – the American Experience*. Not even the secret services could complain that Moynihan's objection to the cult of secrecy emanates from a personal or ideological refraction. In fact the CIA had even awarded him the 'Agency seal medallion' for demonstrating that "effective oversight of intelligence can be realised in a democratic nation without risk to the intelligence priorities". Moynihan as a member and later as vice-chairman of the senate intelligence committee (1977-85) and more lately as the chairman of the bipartisan commission on 'Protecting and Reducing Government Secrecy' (1995-97) had all the access for his research. He quotes the commission's observations: "Secrecy has significant consequences for the national interest when, as a result, policy makers are not fully informed, government is not held accountable for its actions and the public cannot engage in informed debate". And he concludes, "Secrecy is for the losers".

Moynihan proves that the American people and the government have been the worst sufferers of this secrecy culture, an atavism of the xenophobic hysteria which had led to the 1917 espionage act and the Dulles-Hoover cold war gyrations. "East and west paid hideous costs for keeping matters of state closed to the people whom the states embodied." The McCarthy era paranoia which caused deep fissures in the American society and the endless debts on the greatest peace time weapon spending in the Carter-Reagan years which transformed the US from the world's greatest creditor nation into a leading debtor could have been avoided had successive

governments broken away from the secrecy culture and taken decisions on more transparent sources. In July 1975 Moynihan wrote for the *New Yorker* that the Soviet Union could not survive long due to its ethnic turbulence and economic mismanagement. Four years later he predicted in *Newsweek* that the Soviet empire could 'blow up'. In 1984 he told the New York University graduates that America should be less obsessed with the Soviets. Not that Moynihan claims to be the first to echo such assessments. He quotes George Kennan's famous 'containment' article of July 1947: "The Soviet power, like the Capitalist world of its conception, bears within it the seeds of its own decay and that the sprouting of these seeds is well advanced."

And what did the secret studies assess during the same period? A 1957 top secret 'Gaither' report authored by a committee led by Rowen Gaither, head of Ford Foundation (which was declassified only in 1973) found the GNP of the USSR to be one-third of the US and that it was catching up in coal and steel production. It was odd that of the 100 people associated with this report, very few were economists and hardly any with specialised knowledge of the Soviet system. This assessment, accepted by all including the intelligence community, became the keystone of the US strategic thinking in later years including the basis for the famous 'missile gap' theory which necessitated arms build-up. Allen Dulles told the US chamber of commerce in May 1958 that the GNP of the USSR, which was 33 per cent of the US in 1950, would be 50 per cent in 1962 with an annual growth of 6 to 7 per cent. Objections from economists like Warren Nutter of the Chicago school that the Soviet figures were propaganda, and that its growth rate did not even equal the Czarist period, did not impress the strategists. Significantly the senate foreign relations committee was told by Nicholas Eberstadt of the American Enterprise Institute in July 1990 that the estimates on Soviet economic output were always based on the US government statistics, especially the CIA's. Henry Rowen of Stanford, who was chairman of the National Intelligence Council (1981-83), circulated a paper in 1985 to some Reagan confidants that the

Soviet economic growth was close to zero. Yet, the CIA said in 1988 that the Soviet Union's per capita income was higher than Italy's.

Despite early indications of the likely impermanence of the Soviet regime, strategic policy to counter the Soviet threat was based on such studies conducted by secret services. Paul Nitze, architect of N.S 68 which had spelt out Truman's 'Roll Back Soviet Regime' policy giving a military dimension short of war (as against the containment policy of Kennan to be achieved through economic and technological means), told a CIA sponsored seminar in 1997 that the 'significantly inflated' threat perceptions from the intelligence community had resulted in the hardening of the US policy. Kennan, addressing the same seminar, had admitted that the intelligence assessments on the Soviet military intentions began suffering a certain deterioration beginning in late 1948. Even the Dolittle (1954) and the Clarke (1955) committees commissioned to look into the functioning of the executive branch and the CIA had found that covert action was getting in the way of accurate intelligence. Unfortunately, covert action became the cornerstone of the CIA's policy as the cold war intensified, and intelligence churned out through covert action became policy.

Moynihan believes that the US assessments on the Soviet Union went so widely of the mark, in spite of capacity to access the best intelligence since the secret sources could not be tested and substantiated before acceptance as policy inputs. Excessive secrecy also affected the psyche of the American nation in the McCarthy and Vietnam era. He feels that much of the witch hunting of the innocents could have been avoided had the intelligence available with the security services been revealed to the nation and the judiciary to focus on the perfidy of Rosenbergs, Alger Hiss, Theodore Alwin, etc, who pretended to be the victims of a rightist conspiracy. Secrecy became such an obsession with the military that even president Truman was denied access to the 'Venona' file on the cryptanalytical achievements against the Soviet Union which also contained evidence of the treachery of some 200 Americans. The same needless secrecy with the 'Pentagon papers' which revealed no operational details helped create a myth of an 'invisible secret government' during the Vietnam period thereby eroding government credibility.

The 'Bay of Pigs' fiasco could have been avoided had the policy-makers studied an open public opinion survey conducted

by the Institute for International Social Research at Princeton in 1960 which clearly ruled out any possibility of shift in the Cuban public's allegiance to Fidel Castro. Significantly, the October 1961 enquiry done by the CIA's inspector general (declassified only in 1997) said, "The CIA failed to collect adequate information on the strengths of the Castro regime and the extent of the opposition to it, and it failed to evaluate the available information correctly."

At the same time, policy-makers chose to ignore recommendations of knowledgeable persons, even defence specialists, towards a more open government. The special task force on secrecy by the defence science board (1970) led by Frederick Seitz of Rockefeller University, comprising members like Edward Teller and Jack Ruina who themselves had designed and built weapons had recommended: "More might be gained than lost if USA were to adopt unilaterally if necessary, a policy of complete openness in all areas of information."

Moynihan has serious doubts whether the policy of excessive secrecy had really protected even defence secrets. He quotes Hans Bithe, who had taken active part in the Manhattan Project, telling Maryland University students in December 1994 that the Soviets would have been able to fabricate nuclear bombs in five years but because of espionage they did it in four!

The following two instances quoted by Moynihan are very relevant even to Indian conditions on how intelligence and security establishment try to swerve national policy to suit their own assessments:

– Secretary of state, Shultz, started getting feelers from Moscow that Gorbachev was interested in reductions in nuclear weapons but Langley had other views. Writes Shultz in *Turmoil and Triumph – My Years as Secretary of State* (1993), "In Washington and especially from the CIA and its lead Soviet expert Bob Gates I heard the Soviets would not change and could not change, that Gorbachev was simply putting a new face on the same old Soviet approach to the world and to their own people. The Soviet Union is a despotism that works, Gates said."

– President Gerald Ford addressing the National Press Club (June 2, 1997) said, "Every year before the Defence Appropriation Committee began hearings in preparation for putting together a Defence bill, the members were briefed by the CIA. They had charts on the wall, they had figures. And their conclusion was that in ten years, the United States would be behind Soviet Union in military capability,

in economic growth, in the strength of our economy. It was a scary presentation. They were the best people we had, the CIA, the so-called experts. How could they be in error. I do not understand, but they were. Thank goodness they were wrong."

Fortunately all these come to light in the US which has a more open system of administration, with the three independent organs trying to effect checks and balance, or to quote the Tower Commission, operate 'in dynamic tension', protecting the rights of citizens. As against this, we in India have developed a culture of hiding matters of the state from the citizens as well as from other organs of the government. Madhav Godbole, former home secretary had recalled how the home minister and his ministry were bypassed by the intelligence bureau in 1991-92 while holding secret negotiations with the ULFA. As a result, the home ministry's views were not considered while finalising a hasty 'agreement' with the terrorist group. That the so-called agreement passed into history more as a publicity stunt was evident by subsequent events. Moynihan laments that the end of the cold war did not bring about an appreciable change in the US government's attitude towards secrecy. While not advocating an end to secrecy, he certainly sees continued disturbing signs in this information age when most of what is needed to decide policy is available openly. Classification decisions in the US government increased by 2.2 million in 1996. Open sources are still often discounted. Moynihan chides the state department spokesman for blaming the CIA on intelligence failure over Pokhran tests, considering this yet another indication of secret intelligence deciding policy. Instead, the US attitude should have been based on the BJP's 1998 election

manifesto, which gave clear indications of the exercise of the nuclear option. If Moynihan feels so stifled with the American experience even with its elaborate system of checks and balances, Freedom of Information Act, Congressional oversight and Inspectors General, how would he react to the Indian situation which may perhaps be the standing example of Richelieu's dictum, "Secrecy is the first essential in the affairs of the state". Since 1947 the US intelligence agencies have been investigated by 12 commissions, five presidential and seven congressional, the last being the 1995-96 Harold Brown Congressional Commission. As against this, anything to do with the government in India is 'restricted' either in 'public interest' or on 'security considerations'. Public access to the institutions of democracy is restricted and credentials have to be proved to gain entry. We keep matters of state away from the public in 'public interest'. We appoint commissions of enquiry to probe governmental failure and choke them by denying access to vital documents on 'national security'. We hide monumental intelligence failures in preventing incidents like the Rajiv Gandhi assassination from the public in the 'interests of security'. Our intelligence agencies commit gravest errors of judgment like the ISRO 'spy' case, destroying the morale of scientists and yet go scot-free hiding behind a veil of 'official secrecy'. We keep vital matters of state away from the parliament. And we have a government which, while in opposition had wanted the intelligence budget to be revealed, now regressing into the dark labyrinths of secrecy by inventing yet another addition to their lexicon of patriotism in tabooing criticism of RAW, as indicated during the Bnagwat episode.

Restructuring Power Sector in India

A Base Paper

Pradip Baijal

Several countries, both in the west and in the east, developed and underdeveloped, have introduced reforms in the power sector. In all cases, restructuring revolved around the economic and institutional organisation of the sector and the advantages of introducing competition to raise the overall efficiency in the sector. In India, the reforms already initiated, at the federal level, have been the enactment of laws which enable setting up of regulatory commissions at the central and state levels; provide for separation of generation and transmission as distinct activities; recognise central and state transmission utilities as government companies; allow setting up of private transmission lines within the overall supervision of operation of the government transmission utility; and provide for regulation of transmission by the central and state regulators. Orissa and Haryana had initiated reforms before central legislation and others followed later. This paper attempts to study the initiatives taken in different parts of the world and the benefits of restructuring wherever visible. For India, the paper studies the present stage of restructuring and identifies the programme for the future.

SINCE power cannot be stored for marketing but must be sold the instant it is produced, it was generally assumed that power sector had to be a vertically integrated monopoly of generation, transmission and distribution. And since power was vital for every country, it was also assumed that the monopoly had to be in the hands of the government. Theoretically, in a country where generation, transmission and distribution are in the hands of public sector undertakings (PSUs) it could be expected that the investment requirements consistent with adequate and reliable supply, would be fully met by the undertakings or through governmental planning/budgetary process. But this did not happen during the last few decades and the quality and reliability of supply of power deteriorated in most countries. Yet, the dogma that electricity supply, like other public services, should be provided by the state, persisted in most countries. When the state provided this service, it had to cross-subsidise between different classes of consumers, to achieve the stated socio-economic objectives of the state. Introduction of subsidies made the electricity market inefficient and lack of competition led to more inefficiencies. When the state supplied electricity, there was inadequate pressure to pay for the service. Cross-subsidies led to very high tariff for some classes and often when these tariffs became unviable, the state itself allowed them to set up captive power plants leading to uneconomic and unviable fragmentation of the grid and unnecessary invest-

ment in unviable units. To introduce private capital, some countries privatised new generation but that led to more problems as the transmission/distribution sector continued to be inefficient/unviable, making entry of private capital in generation very difficult/expensive. The crisis of public sector managed electricity sector hit the economies of several countries hard and the countries tried various measures of reform with varying degrees of success. The privatisation of the power sector is a recent, but internationally widespread trend which has placed greater reliance on market forces and less dependence on government in the allocation of resources. The privatisation of the power sector has been made possible after recognition that the sector could be separated into generation, transmission and distribution sectors and even these sectors could be broken into several companies, without compromising the economic advantages of a vertically integrated government monopoly, which earlier existed in most countries. The over-capitalised investments made by the governments in the electricity sector (generation, transmission and distribution) had resulted in high levels of reserve plant margin (coupled with poor availability) combined with high debt levels and low returns. Monetary restraints and debt placed pressures on most governments to reduce government expenditures and provide for better service to the people. It has now been recognised that introduction of private capital in the power sector, if properly

structured and implemented, can lead to the following advantages:

- Improve public finances through sale of state assets and elimination of subsidies gradually.
- Improve performance of power entities by introducing competition between different players, primarily by creating a wholesale power market, giving higher returns to those supplying power at lowest rates.
- Lower consumer tariffs through creation of institutional framework for dealing with consumers concerns.
- Attract more investment, including foreign investment.
- Develop wider private share ownership in key economic activity.
- Improve revenue realisation at all levels, thus making services more efficient.

I Reforms in Other Countries

The entire process of reforms in most countries was initiated in the mid-1980s and early 1990s. Some have reformed fast and are at the consolidation stage (e.g., Chile, England, the US, Argentina, Australia), others, in the transition stage (e.g., Brazil, Scotland, Northern Ireland, Holland, Belgium, Sweden, Portugal); but most are still in the formulation stage (e.g., Spain, Germany, Australia, South Africa, Peru, India, Zambia, Russia, Ukraine). The essential aspects of reforms in different countries are given below.

Chile: The restructuring of the power industry was the last phase of economic

reforms introduced in Chile. The restructuring of economy started in 1974, to reverse the Allende government's determination to transform, through nationalisation. Phase I of the reform (1974-75) consisted in returning nationalised companies to their original owners, phase II (1975-83) involved sale of about 100 nationalised companies for generation of revenues for the government. Phase III was a stabilisation phase and phase IV started the power sector reform.

Till 1980, the power sector was vertically integrated. In the early 1980s, the PSUs participating in the power sector began to be restructured as joint stock companies. The National Production Company held control of the PSUs in transition, acting as a holding company, in charge of reorganising and privatising the companies under its supervision. Privatisation began with the sale of stock to company employees at low prices, who were allowed to draw upon payments in advance that were set aside as their pension funds. This was an attempt to show that the privatisation process was irreversible. With the start of restructuring, generation and distribution was separated and Economic Load Dispatch Centre (LDC) was created. Restructuring allowed open entry to participation in the generation area, but with no supply or purchase obligation. New generator had to rely on the market for sale of its power. The LDC dispatches the system according to an economic merit order and determines SRMC of the system. During the initial years, transmission remained a monopoly. Generators had right of access to the line if capacity was available, subject to payment of wheeling charge, to be determined by the regulator. Distribution required a licence, which was granted under a competitive bidding system.

Pricing for different segments is determined as follows:

(a) Generators – SRMC. However, prices are negotiated for energy sales to deregulated energy users (large consumers). (This leads to competition and market situation.)

(b) Transmission – SRMC on the average incremental cost, or negotiated between parties.

(c) Consumers – Node price plus LRMC of the distribution enterprise plus margin. Regulator determines distribution margins every four years.

Prior to reforms, there were heavy defaults in payments by consumers, distributors, etc, and the system was unreliable. There were heavy losses/inefficiencies. Prompt payments increased effi-

ciency/competition and brought the tariffs down for consumers.

England: The restructuring of the power sector in England was a part of the restructuring of the whole economy in the UK, a process that started in 1957, but which derived strength and character in late 1970s, the famous Thatcherite years. Yet, the power sector's reforms were delayed till late 1980s, to first put in place the reform structure through widely debated and appropriated structured reform legislation of 1988. The success of the England model is due to a well structured and sequenced regulatory and unbundled system, and the maturity of the restructured components which enhanced investor confidence in their potential profitability, thus increasing investment in the sector and thus more competition and consequently greater efficiency.

Before reforms Central Electricity Generating Board was a monopoly for generation/transmission and area boards for distribution. Competition was introduced through separation of generation, transmission and distribution, and by adding intermediary systems which allowed the cheapest generator to produce more by being able to sell more to the grid and by contracts between generators/large consumers.

The reorganised power sector consists of the following:

CEGB has been divided into three large generating companies – Nuclear, National Power and Powergen – which operate under licence and work in a deregulated

sector with competitive supply/market conditions. Only the nuclear sector remains in government hands.

Area boards have been converted into 12 privately owned regional electricity companies (RECs). The RECs provide distribution services in non-exclusive interconnected service areas. The RECs can supply to large customers in different distribution areas, increasing competitive pressure on distributors.

The strictly regulated National Grid Company (NGC) possesses and operates the national interconnected transmission grid and sub-stations and performs dispatch function under an operating licence. The NGC is jointly owned by 12 RECs, but works under the regulator's supervision.

The maximum competitive pressure is applied by bulk power sales through non-regulated contract and a 'pool' or spot market. The English power pool encompasses the power system of England and Wales, but it is also open to electricity imports from France and Scotland. The 'pool' consists of generators, distributors and trading power intermediaries. The pool price is determined for each half-hour period based on an optimum dispatch schedule, without network constraints, but in merit order according to bids offered by generators or other sellers. The bids lead to a single purchase price every half-hour. The final pool price is determined after adjustment for the eventual difference due to actual load dispatch.

The US: For decades, the US power sector worked under the traditional regulatory

model where vertically integrated investor-owned utilities supplied power within defined territories, subject to financial and price regulation. The US privately owned electricity sector, due to the creation of vertically integrated geographical monopolies, was sheltered from competition and was criticised for inefficiency. PURPA Act, 1978 encouraged co-generators and transmission regulation. This led to dynamic increase in diversified supply sources much beyond the initial expectations and increased competition, thus weakening IOUs monopoly. By mid-1990s, federal policy created the framework for a competitive market in wholesale power. This led to states vying with each other to be among the first to introduce competition and customer choice in the retail markets.

The US restructuring system has given marked independence to states in setting their own development policies. The state utility commissions establish entry rules and incentives to bring in more competition and lower consumer prices. At the federal level, FERC sets prices for inter-connected transmission services.

The likely congestion in the transmission grid owing to increasing market agreements between generators, distributors and large consumers seeking wheeling services is an area of concern in the US.

The first power pool (PJM) in the world was established in the mid-Atlantic region of North America by the owners of various power utilities. It became a limited liability company in 1997, and started operating as an ISO with membership open to generators, transmitters and consumers. Before formation of PJM, transmission system comprised of monopoly transmission companies where operation was influenced by demand and supply gap in a particular zone. It was observed that sometimes the marginal cost of generation is lower in another zone for a consumer than in the zone to which he belonged. It was then that zonal transmission companies decided to form an ISO with energy exchange taking place across the zone on marginal cost basis. It is pertinent to mention that any transmission work in a zone is to be taken up by a transmission company which enjoys monopoly status in the zone. Similar ISOs have been set up in other parts of the US also. This is against the pattern of only a few years back where the state utilities traded bilaterally only with state interconnectors and almost without any regulation.

Argentina: The restructuring of the economy in Argentina was a key element in the stabilisation policy adopted after the

hyperinflation years of 1989 and 1990. It had both economic and political goals: the revenues realised from the sale of public assets were critical in financing the fiscal deficit and reducing public debt, and the continuity of the effort enhanced the credibility of the government's commitment to remedy the problems of the economy. The privatisation process occurred within a very short time frame in early 1990s, and generally accomplished the goals that had been set for it, raising US \$ 17.3 billion for the electricity sector alone.

The power sector in Argentina faced major problems in early 1990s: (a) public inefficiencies; (b) breaks in the payment chain leading to multiple inefficiencies in supply chain; (c) tariffs not related to economic costs leading to inefficient use; (d) supply and transport restrictions; and (e) blackouts. These factors forced the government to plan for major restructuring and in 1992, the transformation took place and a legal framework similar to the one used in the UK was adopted that divided the vertically integrated electricity business into three distinct activities of generation, transmission and distribution. Under the new law the following agencies were set up:

CAMMESA – manages wholesale electricity market players transparently, using high technology, facilitating efficient energy generation and sale.

ENRE – works as the regulator for the entire power sector.

WEM – consists of all generators, transmitters, distributors and large users as well as other participants like traders and brokers.

Generators – 80 per cent of the generation is privatised. Generators have freedom to enter into contracts with distributors and large consumers.

Transmitters – consist of the national company Transener (mostly 550 KV) (a private company) and six regional and two independent transmitters at 220 and 132 KV level.

Distributors – 70 per cent of the sector is privatised and there are about 28 companies in the distribution sector.

Large users – enter into agreement with generator, distributor or traders.

Traders – are responsible for commercialisation of generation, demand, royalties and exports/imports.

The impact of Argentina's power reforms has been very impressive. Formerly the electricity market was immersed in continuing technical and financial crises and unmet demand resulted from insufficient supply. Today, Argentina has surplus power which can be exported to

neighbouring countries. Installed capacity during the reform period (1992-97) has increased 36.5 per cent, overall thermodynamic efficiency has improved by 45 per cent, net demand has grown by 36 per cent. The contract market now accounts for 60 per cent of the electric energy consumed. Mean prices have declined 47 per cent – from US \$ 49/MWh to \$ 26.

The speed with which the system was privatised has left some serious problems which are now being addressed: A weakness of the regulatory system is that it depends upon competition in generation to set prices and fines in transmission and distribution to assure service quality. There have been cases of failure in transmission and distributions system. The price cap regulation does not provide the near term (five years) for the benefits of productivity gains to be passed on to the rest of the economy through price reductions. Expansion of the grid can only take place if the investment criteria of the private sector owners is justified and the beneficiaries are willing to pay. This often leads to underinvestment in the sector, leading to a sub-optimal grid.

Australia: Prior to the reforms of recent years, the supply of electricity in Australia was provided by vertically-integrated, publicly-owned state utilities. The power industry was never operated on a national basis. Interstate grid connections were weak and electricity trade had been limited between interconnected states. The

state governments were responsible for operational and planning activities, and tariff structures. The national government's only involvement was as a principal shareholder in a major hydro-electric scheme with the state also being partners in the JV. Some regulatory controls were exercised, mainly control over state borrowing limits, taxation, foreign ownership, and environmental regulations.

Electricity reforms in Australia, initiated in mid-1990s have occurred both at the state and national levels. The nature of reforms is somewhat similar to reforms in the US. The national government's effort has led to a more active role for the national government through the establishment of a national grid and national pool. The new national regulatory regime is light-handed and a form of price regulation has been applied to regulated sectors.

The objective of reform in Australia was to deliver more efficient and sustainable use of capital infrastructure and energy resources to improve Australia's domestic and international performance. The state governments have estimated that electricity reforms would add an estimated \$5 billion annually to the country's GDP.

The reforms were initiated in the states by the national government agreeing to provide financial assistance payments to the states totalling \$4.2 billion (Australian dollars in return for the state meeting their agreed obligation, including reform of their electricity, gas, water and road transport industries. The national government also encouraged reforms by creating a competitive national market. This was done through unbundling; ensuring non-discriminating areas to the national, transmission and distribution system; establishing transmission prices that are reflective of actual costs; ensuring that customers, i.e. generators, marketers and traders have a choice of supplier; using a merit order dispatch system; providing for interstate of generation; ensuring non-discriminatory access for new industry participants in generation and marketing; and establishing uniform regulation based on an industry code of conduct.

The target is that the fully competitive Australian national electricity market (NEM) would develop in stages up to 2001.

The national electricity code establishes the regulatory and operational framework of the new Australian electricity market and binds all participants in the wholesale power generation market to specified rules. The code addresses market rules, grid connection and access, metering, network

pricing, system security and procedures for code administration.

At the state level, significant reforms have been initiated in preparation for their eventual entry into the national electricity market. Although some states have decided not to participate in the NEM, they have implemented reforms where possible to gain efficiencies to supply customers and generators. Each state government has made different arrangements for separating the segments of their electricity industries for entrance into the national competitive market. The state of Victoria is the first and most advanced in its reform among states that are participating in the NEM.

Victoria started its reforms in 1993 with the separation of the electricity systems into generation, distribution and transmission. In 1994, Victoria restructured its state-owned industry further with the intention of privatising it. The generation sector was divided into five companies and the Victoria power exchange was established to operate the wholesale power generation market. The transmission system was divided into two components, high voltage grid network and the power exchange responsible for pool operation and system dispatch.

In addition, the office of regulator general was created to promote competition and efficiency, and to protect the rights of consumers. Victoria initially permitted the five distribution companies to retain monopoly rights to supply power to customers in their respective geographical regions. However in 1996 in an attempt to introduce competition into what was still a state-owned system, large users were allowed to purchase power from any of the generating companies. The current requirement that the five distribution companies have to supply electricity to large customers will be phased out by December 2000. In December 2000, all customers in Victoria would be contestable.

In 1995, Victoria began the privatisation of its electricity assets. Since launching its privatisation programme, the state has generated almost \$16 billion as revenue, an amount which is mostly being used to repay state government debt.

Brazil: Till 1993, Brazil's power sector was dominated by Eletrobras, a PSU, holding most of the country's generation, transmission and distribution assets. The government was responsible for setting tariffs and controlling investment decisions. Electricity pricing, being a government decision, was characterised by a failure of average tariffs to cover either

average or marginal costs, discrimination by end-users, and uniformity of tariffs across regions, despite differences in costs. The system also suffered the ills of over-staffing, high energy losses and under-investment in system improvements.

The 1993 privatisation programme included abolition of uniform tariffs, guaranteed rates of return for power companies and established a national grid with open access to IPPs and captive power plants, to sell either to distribution companies or end-users.

However, the main weakness in Brazil's reform plan was not to clearly specify the reform up front, nor the sector's reorganisation plan and associated national regulatory regime. This lack of clarity has hampered privatisation efforts. The sale of two distribution companies were marked by disappointing levels of participation, both in the number of bidders (1-2) and the value of bids. The disappointing response was attributed to the lack of transparent regulatory regime, the infrequency and uncertainty of tariff adjustments and the consequent inability to predict an adequate stream of future revenue. This

North-east	2.4	0	18.7

has deterred private investors from making substantial investments in the Brazilian power sector.

Scotland: Before the reform and privatisation phase, the sector had been vertically integrated with two regional boards responsible for generation, distribution and transmission. In 1990, these area boards were reorganised into Scottish Hydro Electric, Scottish Power and Scottish Nuclear Ltd. While the first two were privatised, Scottish Nuclear Ltd continued in government hands. Both privatised entities, like in England are allowed to compete in electricity markets in Scotland and also in England. Like in England, regulation serves to protect consumer interests in transmission, distribution and supply. RPI-X technique is also used in Scotland by the regulator.

Northern Ireland: Until 1992, the electricity sector was integrated with generation transmission and distribution in the hands of a single national company. In 1992, the generation units were broken into three companies. Transmission and distribution was allowed to remain as a monopoly but direct sale to large consumers as in England applied competitive pressures in the power market.

Holland: The system resembles the German system. It has four generation and 38 distribution companies. The distribution companies obtain power from generators or self-generators (surplus power from captive power plants). In 1949, an association of electricity generators was created which owns generation and transmission, including intercountry connectors. The only competitive pressure is put through a law allowing consumers to buy their energy from distant distribution companies or through imports.

Spain: Till 1987, the electricity sector was not a vertically integrated monopoly. It was converted into one in 1987, in government hands. Since early the 1990s there have been halfway house attempts at restructuring aimed at separating generation and distribution, but no efforts have been made to put competitive pressures on the electricity sector.

New Zealand: In the mid-1980s, the government started examining the efficiency of all spheres in the economy, with particular reference to those sectors which were under state control and where economic gains could be obtained by restructuring through commercialisation and subsequent privatisation. The decision to restructure electricity industry was taken to increase efficiency of the sector by privatising generation through competitive entry of private generators, and

deregulating and most importantly, offering customer choice at the distribution level.

In 1993, a corporatised transmission company was created. In 1995, a wholesale electricity market was created, operated by an independent organisation, the Electricity Market Company (EMCO). The 1995 policy also placed a limit on how much new capacity the central generating company can build in the future. In 1996, this company was broken into two. The central generating companies offer energy in the market and electricity is purchased by bids for energy. The offers are ranked as per the price offer and electricity is purchased based on these bids and generators are dispatched on merit order. Electricity purchase prices are set at the spot-price to satisfy demand every half hour. Large consumers have been given the choice for purchase of power from companies other than the area company.

Germany: The sector consists of eight federal companies that own interconnected network, intermediate regional companies functioning between federal companies and end-users or local supply companies, and municipal companies which own the distribution grid. There is no centralised decision centre. The eight interconnected grid owners co-ordinate and agree on the start-up of operation for the different generator groups according to requirements. There is full access to the interconnected network in a regime of horizontal agreements rather than of binding access rights. The only regulatory enactment is an anti-trust legislation.

South Africa: In 1991, generation and transmission was a national monopoly with five distribution areas. Electricity control board, a bureaucratic body inefficiently regulates tariffs.

Zambia: Reforms are in the planning stage. Zambia has abundant hydro-resources and to harness the same the private sector participation is encouraged for which many benefits have been offered. Similarly, for construction of transmission lines, private sector participation is encouraged. Like in the US, an ISO is planned for the Zambia Power System. System operation and loading of the line is the responsibility of grid system operator, which shall purchase power from generators. The private

transmission companies are insulated from the uncertainty of daily dispatches and are paid service charges covering capital and maintenance cost including ROE for the transmission line.

Russia: The Russian power sector is the largest utility company in the world with 430 power plants that produce 1 trillion kWh. During the Soviet era, it successfully provided power suppliers, but in the long term, failed to provide sufficient incentives for generation, consumption, investment or financing. In 1992, after the dissolution of the Soviet Union, the state-owned power sector was converted into a corporate holding company. Initially the holding company was owned by government but later 51 per cent of the stocks were sold to officers, employees and citizens. There is no restructuring yet but the holding company and USAID have mutually agreed to a restructuring plan that would promote competition and economic dispatch of power. Russia's model thus presumes that competition, rather than ownership is the more important factor in enhancing internal productivity of the power sector, by providing impetus for innovation by PSUs. The goals are to maintain a high level of reliability, create a national wholesale market, establish a competitive retail market for large customers, attract foreign investment, and rely on market incentives rather than regulation where possible. The plan has moved very slowly, to the discomfort of the national government. Owing to slow progress of reforms distribution companies are in transition and are experiencing problems like theft, non-payment, overstaffing, losses leading to late payment of wages, and demoralisation of staff leading to more inefficiencies.

Ukraine: After the dissolution of the Soviet Union, the individual republics, began transforming their economies to promote competition and attract investment capital. In May 1994, the president issued a decree setting forth 'Measures required for the market transformation of the power sector in Ukraine'. The decree was reconfirmed after elections. The restructuring plan of Ukraine was identical to the British model and set a time target of 18 months. The milestones were unbundling of the eight vertically integrated

TABLE 9: FREQUENCY SPECTRUM OF REGIONAL GRIDS, 1997-98

Year	Per Cent of Time when Frequency (in Hz) was					
	48.5	48.5-49.0	49.0-49.5	49.5-50.2	50.2-50.5	Above 50.5

SOFs into separate companies owning generation, distribution transmission; the creation of a pool and economic dispatch centre; and the creation of an independent federal regulatory body that would oversee the operation of the national electricity market, have jurisdiction over issue of licences and address consumer complaints. By 1995, most of these goals were achieved and the beginning of a competitive pool with economic dispatch of power was in place.

Under the former Soviet Union, the power companies provided many social functions like setting up hospitals, day-care schemes, roads, buildings, etc. With restructuring and the institution of a competitive market, these functions were transferred from the power companies to the federal and local governments.

The restructuring of the Ukrainian electric utility system continues even now. The corporatisation phase of the restructuring has been completed, the unbundling has taken place, the regulatory commission has been created, competitive market introduced but the companies are still government-controlled. The second phase of restructuring will be the privatisation of the newly created joint stock companies, and a schedule for sale and the distribution of the stock has been developed.

Canada: In Canada, there is a national energy board comparable to our central electricity authority. But the national energy board's powers are limited to approval of electricity exports and approval of international power lines. The pace of restructuring and regulation has been slow in Canada mainly due to lower electricity costs of predominantly nuclear and hydel stations, absence of federal regulation, dominance of provincially-owned utilities and local issues.

The province of Quebec has started electricity regulation recently. The regulator, Regie de l'energie was established in 1997 to regulate natural gas distribution and electricity transmission and supply monopolies, examine complaints from consumers and to provide a transparent, equitable, independent and impartial decision process.

In Ontario province the government has appointed a committee to suggest the pattern of regulation and restructuring of the energy sector (including power sector). The plan is for introducing full competition into Ontario's electricity system in the year 2000.

In the state of Alberta the government has restructured the power market without appointing a regulator. Traditionally,

Alberta had vertically integrated utilities as in India. On January 1, 1996, the Electric Utilities Act took effect. This act created a power pool consisting of all the electric energy bought and sold in Alberta, along with energy imported and exported through the province. The pool works like a commodity exchange, provides a place for distribution companies and markets to buy power and for power producers and marketers to sell their output. The power pool itself does not buy and sell electric energy. Rather, it operates the market, receiving offers and bids from pool participants and establishing an hourly market price for electricity by matching supply with demand.

European Union: Whereas changes were initiated in the vertically integrated power sector in the US, the UK and in many other countries during the 1970s and 1980s, most of the countries in Europe continued with their vertically integrated structure of the power sector till mid-1990s. Most of the changes were initiated after the formation of the EEC and as late as on February 19, 1999 competition was officially introduced in the European electricity markets. European Union directives stipulate that large industrial consumers will then have the right to choose their electricity suppliers. At the same time, new entrants will be allowed to submit tenders for building power stations and supplying customers with power directly over European union transmission lines. Thus for continental Europe, this would start the dismantling of the old vertically integrated model of electricity production and supply – a model which was built and maintained by different countries, fearing market failure in case of breaking up of the vertically integrated monopoly. Political and technological changes have made this kind of centralisation obsolete, so the trade-offs that formally justified less than optimally efficient integrated systems no longer hold. Thus in the first phase of liberalisation introduced by the European

union, the business downstream, wires (transmission, sub-transmission) and retailing (distribution), would be separated from generation. At this point, generators of electricity must compete to sell their output, and such competition becomes feasible. In the second phase, the wires part of the business would be separated from retailing and forced to operate as a 'common carrier'.

Enforcing competition by EU would mean different things in different countries. Scandinavia and the UK are already competitive; Holland and Spain are close behind; Italy, Germany and eastern Europe are about five years away and France is further behind. Though each country in Europe now recognises that competition would come eventually, utilities would work to slow down the process of liberalisation/restructuring/competition wherever they can.

II Lessons of Reform

Experience of different countries has shown that restructuring of the power sector consists of many parts; each part complementary to the other and the efficiencies of reforms are dependent on the quick and time-bound enforcement of the entire package. Experience in these countries has also shown that half-hearted reforms can lead to problems in the working of the power sector. The components of reform package in most countries are:

- The separation of the government from commercial activities in the sector, but retaining the role of policy-maker for it.
- Setting up of national and state level regulatory commissions to supervise the working of different players in the power sector and regulating them through clear-cut and transparent rules and setting their tariff levels.
- Unbundling the power sector into transmission, distribution and generation.

TABLE 10: BACKING DOWN AS PER CENT OF THERMAL GENERATION

(MU per cent)

	1994-95	1995-96	1996-97	1997-98	1998-99
Central sector	1.97	1.02	0.81	4.05	9.66
State sector	3.48	2.60	1.48	3.47	3.92
Private sector	3.72	2.43	2.79	3.74	6.33

TABLE 11: INTER-REGIONAL TRANSFER CAPACITY AVAILABLE

	1994-95	1995-96	1996-97	1997-98	1998-99
Interregional wheeling capacity (MW)	1630	1630	1630	2630	3000
Generating capacity (MW)	77434	82032	84156	85780	89007
Wheeling to generating capacity (per cent)	2.10	1.98	1.93	3.06	3.37

Note: This inhibits creation of a national electricity market.

(d) Decentralisation of planning process through automatic and easy entry of generators, with no commitment regarding supply and purchase.

(e) Setting up a wholesale electricity market at the national and state level. (Setting up a national level wholesale market normally catalyses the setting up of such markets at the state level.)

(f) Introduction of regulations in the sector that encourage competition and efficiency.

(g) Transparent economic dispatch system at the national and state level.

(h) Incorporation of the private sector under its own risk conditions in a free entry/exit power market.

(i) Direct agreements between generators and also distance distributors with large consumers (to increase competitive pressures on generators and distributors).

(j) Compulsory access to the grid at pre-determined wheeling charges for generators, distributors, subject to line capacity being available.

Interest in restructuring and reform of the power sector is a worldwide phenomenon, being pursued in different forms in different countries, depending on the structure and condition of the economy and political institutions. Yet the core of the reform programme remains the same, viz. establishment of transparent regulatory structure, unbundling of the sector, creation of national and state grids with transparent and efficient dispatch, entry and exit systems, wholesale market in power, more choice regarding purchase to the consumers and other measures that improve competition and efficiency in the sector.

In the western countries, the reform programme is seen as an element of redefinition of the state while in other parts of the world, reform is seen as one component of a broad economic agenda that includes price liberalisation, macro-economic stability, privatisation, creation of legal framework and financial systems that encourage private investment, both through national and international companies. The importance of the power sector in the growing national economies of the developing world puts a lot of pressure on the successful formulation of a restructuring plan. In view of the vital importance of the sector, once a decision to reform/restructure is taken, the national governments cannot allow the policy-makers or implementors to drift and yet at the same time err in deciding the transformation route.

The experience of reform/restructuring in different countries has shown that it generally fails on account of missing pieces in the reform legislation. The reform

programmes have been less successful wherever

– They were not clearly defined in an identified time schedule.

– They did not lead to setting up of unambiguous regulatory structures to decide on rules regarding tariff, entry to the sector, etc.

– The reform was not an integrated programme which could look at the restructuring requirements of all the players (generation, transmission and distribution) in the sector.

– The reform programme did not remove the potential for political interference in working of entities and in areas other than policies.

– There was inadequate commercialisation of the system before privatisation efforts were initiated.

III Power Situation in India

It would be clear from the restructuring programmes in a very large number of countries, both western as well as eastern, of the American subcontinent, of Europe and of Asia, that all countries have realised that technology exists to break up the power sector from the vicious natural monopoly into small niches, where different players can work in a competitive mode. Before we discuss the relevance of restructuring programmes of different countries to India, let us examine the present position of this sector.

Tables 1 and 2 would show that the Indian power sector is facing major problems. They also show that the capacity of the national/state governments to finance the increasing investment needs of the power sector are sharply diminishing. The sector is beset with severe problems of non-payment at each level, increasing losses of state electricity boards, large-scale thefts of power, overstaffing, under-investment in transmission and distribution, problems of evacuation from one region to another, increasing backing down of power due to inadequate transmission and thermal hydel mix, etc.

The reform and restructuring measures introduced in India so far consist of the

setting up of regulatory framework, unbundling of the system into generation, transmission and distribution and setting up of a framework that could break up these into small niches that could facilitate entry of private capital (in some states only though others are also planning similar action through state enactments, etc). Besides unbundling, the reform measures are also integrating the system into one national transmission network.

It may be recalled that at the time of independence, approximately 80 per cent of India's power supply was provided by private companies or local authorities and was thus limited to urban areas. After independence, as the licences of these companies expired, they were taken over by SEBs created under Electricity (Supply) Act, 1948 with the exception of five companies, licensed under the Indian Electricity Act, 1910, in Bombay (2), Calcutta, Ahmedabad and Surat. The SEBs created a vertically integrated monopoly for the entire state. In early 1960s, a need was felt to integrate the state grids into regional grids, looking at the inadequate resources for power generation in different states. Regional electricity boards (REBs) were created by government resolution in mid-1960s to integrate regions into one grid. Later, the REBs were given statutory status in 1991, through amendment in the Electricity (Supply) Act, 1948. Since all the coal supplies came from the eastern states and all hydel sites were located in the north and north-east, further need was felt to integrate the entire country into one grid and a powergrid was created in late 1980s to ensure that power could be transmitted on wires from one region to another, through creation of a national grid. In mid-1990s, regional load dispatch centres (RLDCs) were transferred to Powergrid and REBs continued with skeletal staffing from CEA, to oversee the functioning of RLDCs. With the creation of Powergrid and investment in inter-state and inter-regional lines, it has now become possible to think and plan for an improved integrated national transmission network in the country.

It was realised at the beginning of the eighth plan that the government could no

TOTAL	4940.08	6766.54	7225.93	9899.13	16587.88

longer finance the incremental capacity requirements of the power sector. In response to this reality, the government formulated a policy in 1991 to encourage investment by the private sector in generation. Legislation governing the electricity sector was amended in October 1991 allowing private investor to generate power and sell it to the grid. The policy permitted 100 per cent foreign-owned companies to set up power project, without any export obligations. Attractive returns were provided in the policy. Since the policy was based on negotiations leading to tariff finalisation, the initial projects led to high tariffs. Besides, the poor financial position of the SEBs which are the monopoly purchasers of power, led the central and state governments to offer many artificial comforts to the new investors.

However, it was soon realised that not many generation projects could come up by this route and unless the sector was restructured and unbundled, investment would not be made in the sector. It was also realised that unbundling could not efficiently take place unless regulators were appointed first. After discussions in different fora over years, the central government issued an ordinance which was later converted into an act in 1998, to enable the appointment of regulators at the national and state level. By another amendment of the electricity acts, transmission was separated as a distinct activity, permitting the setting up of privately funded transmission lines within the control, supervision and operation of the national and state transmission utilities. The enactment also provided that transmission utilities would be government companies and the transmission sector would be regulated by central and state regulators.

Central Regulatory Commission was set up soon after the enactment of the Electricity Regulatory Commission Act, 1998. Such commissions had already been set up in Orissa and Haryana in 1996 and 1998 respectively under state legislations. These legislations were saved by the central government at the time of the enactment of the central act. Subsequent to the enactment of the central act a large number of states have gone ahead with the setting up of regulatory commissions. With the concurrence of the central government, Andhra Pradesh has passed a separate Regulatory and Restructuring Act, in line with the Orissa and Haryana acts. There is need for other states also to pass such restructuring acts. Due to the federal nature of our Constitution, the central government had decided that whereas it would pass an Electricity Regulatory Com-

mission's Act, it would not impose a restructuring model on any state by central legislation but would only issue guidelines and model acts for the consideration of the state governments.

INDIAN REFORMS – PRESENT POSITION

The need to introduce competition and more investment, wherever possible, has been the driving force behind restructuring of the sector in India also. Generation was the natural starting point of introducing private participation which was achieved under the 1991 policy by amending electricity legislation. Initially generators were allowed entry on the basis of MOUs and the tariff determined on cost

plus formula. When it was realised that it was leading to high tariffs, the 1995 policy provided for entry of generators on the basis of competitive bids. However, since the sector was not unbundled in all the states, it was soon realised that this was not easily implementable. In 1997, GoI amended the tariff notification for IPPs, and laid down rules for competitive tariff bidding. It was also realised that since most of the thermal and hydel resources were in the eastern and the northern regions, large power plants had to be set up on inter-regional basis, requiring long inter-regional transmission lines. To encourage the states to buy power from such projects, GoI allowed fiscal conces-

Third Edition of NATIONAL ACCOUNTS STATISTICS OF INDIA 1950-51 TO 1996-97

Data for 47 years in each of the 40 revised and updated table series on different dimensions of national accounts aggregates are presented.

On state domestic product, for the first time statistical series on both net and gross SDP in respect of all 25 states and three union territories for 17 years from 1980-81 to 1996-97 are available.

Descriptions of the concepts involved and methods and procedures of data compilation adopted have been further expanded; likewise the extensive references to the analytical literature on national accounts and related literature.

sions to these mega projects. To encourage the states setting up regulatory commissions and to initiate privatisation of the grid, the mega power policy also laid down that the states will be allowed to buy power from these units only if they had initiated such measures.

It was recognised that meaningful reforms will not take place unless more distribution areas are privatised. This has been encouraged through state enactments, mega power policy and by fixing of returns for distribution companies under the E(S) Act, 1948. The ERC acts further clearly provide that regulators will supervise and fix consumer tariffs for different classes of customers keeping in view the principles enumerated in the E(S) Act, 1948.

Generation and distribution were recognised as separate activities in the Indian electricity laws. The Electricity Laws (Amendment) Act, 1998 identified transmission as a separate activity. The Electricity Regulatory Commission Act, 1998 and the state acts had enabled the regulators to be appointed at the national and state levels. The central government and some of the state governments have appointed regulators and a few governments have unbundled the sector into transmission, generation and distribution through state enactments. However a number of elements of reform measures have not yet been attempted at the central or at the state level. These are:

- (a) Setting up of a wholesale electricity market; and
- (b) Introduction of competition and efficiency in the electricity market through:
 - economic dispatch system;
 - compulsory access to the grid to generator and distributors subject to availability of capacity - on prefixed wheeling charges;
 - encouraging direct agreements between large consumers, generators and distant distributors;
 - easy entry into the sector of different players in competitive market conditions supervised by the regulators; and
 - determination of generation tariff in a competitive market environment - through the creation of a pool/wholesale market.

IV

Agenda for the Future

The federal structure of the Indian state and the power sector is very similar to the structure as it existed in pre-reformed US, Australia and Argentina. The reform programme in India has to suit its own requirements, but it should consider the

structure and methodology followed in these federal countries.

The central government has to take effective steps to set up the wholesale power market, create an electricity pool and enforce market-like competitive pressures. Such initiative at the central level will force the states to create similar conditions (as is clearly visible in the Australia experience).

The initiatives to complete the missing links in the reform chain at the central level fortunately can be taken without any further legislative measures. These can be achieved by government initiated measures and through regulation by central electricity regulatory commission. The components of this initiative would be as follows:

Issuance of the ABT notification by CERC, leading to merit order dispatching, disciplined operation of the grid and stable frequency conditions, making trading and setting up of inter-regional grids easier.

Issuance of a grid code by CERC which can create market-like conditions in centrally administered inter-state and inter-regional power markets.

CERC has been charged with the responsibility of increasing competition and efficiency under the act. The grid code and other electricity regulations to be issued by CERC can thus provide for different reform measures which would increase competition and efficiency like easy, automatic and transparent entry of different players in the inter-state power market and grid under clearly defined principles and rules; and direct contracts between generators/distant distributors and large consumers, etc. This last measure would perhaps require legislative amendment also but can be initiated for central government's large customers without recourse to any amendment.

CERC can also issue rules/regulations for states' transmission lines, whenever central electricity passes through these lines. CERC regulations can thus create a national transmission grid.

It is well recognised that reforms cannot be meaningful unless competition and privatisation are initiated. The centre must, therefore, break up its generating CPSUs into smaller companies and introduce measures to enable competition amongst these companies. These could also later be selectively privatised for generating more resources for further investment and for reducing fiscal deficit pressures on the central government.

Once time-of-the-day metering is introduced in the National Grid, it would be possible to fix time-of-the-day tariffs

through competitive bids. At this stage entry of private hydel projects would be possible without any tariff fixation, agreements, etc. A competitive market would also enable easy entry of new thermal plants without pre-determination of generation tariffs, etc.

Massive investments are required for creation of an effective national grid - since this would require the setting up of a national load dispatch centre and many more inter-state and inter-regional transmission lines. Powergrid does not have enough resources to take up these lines. Entry of private operators in the system would take time. The central government will, therefore, have to examine different funding arrangements for strengthening and financing the national grid. A number of models for such financing are prevalent in other countries and they would have to be studied for implementation.

It also needs to be ensured that breaking up and restructuring of the central electricity sector does not increase the taxation liability of the sector. On the other hand, major fiscal concessions need to be given to the broken up generation, transmission and distribution entities at the central and state level.

As has been identified above, major reforms need to be implemented in a time-bound manner in the central sector. Only such reform measures would encourage the states to follow suit. It has also been identified in the preceding paragraphs that these reforms can be initiated within the present laws by CERC and central government action. These reforms will also follow the pattern of successful reforms in other federal countries. GoI/CERC, therefore, must increase interaction with governments and regulatory commissions of Australia, Argentina and the US to accelerate the process. We also need to engage consultants who had prepared the rules and regulations and implementation documents for execution of reforms in these federal countries. And lastly, between the government of India and CERC we must finalise a time-bound schedule for finalisation of the central reform plan and for implementing it.

The follow-up of reforms at the state level and creation of wholesale market, open access, direct agreements between generators/consumers will throw up a number of policy issues at the state level. It is expected that the reform patterns being initiated in Orissa, Haryana, Andhra Pradesh, etc., would provide answers to complicated and sticky policy issues. Once any state shows a successful model, other states are bound to follow suit.

Colonialism and Liberation

Ambedkar's Quest for Distributive Justice

Vidhu Verma

Ambedkar denounced caste system for violating the respect and dignity of the individual; yet his critique of caste-ridden society also foregrounds the limits of the theory and practice of citizenship and liberal politics in India. Since membership of a caste group was not a voluntary choice, but determined by birth and hence a coercive association, the liberal view of the self as a totally unencumbered and radically free subject seemed plagued with difficulties. Though the nation state envisages a political community co-extensive with one cultural community, it need not, Ambedkar argued, necessarily lead to abolition of discriminatory caste practices in civil society. To restore the cultural rights of stigmatised populations, unredeemed by the nation state, propelled Ambedkar to seek solution in Buddhism.

IN this essay, I examine the ideas of Bhimrao Ambedkar (1891-1956) who was a dominating figure and active organiser of the dalits during the anti-colonial struggle against the British in India.¹ I examine his concept of distributive justice which is based on the idea of a casteless society. This is of course a vast topic, and in order to make it manageable, I shall concentrate on certain aspects of his theory, namely, the critique of domination and oppression of dalits, and their exclusion from the rights of citizenship. Ambedkar's main claim is that a society based on the caste system cannot be a 'real' community because it violates the respect and dignity of individuals.² I shall argue that his critique of a caste-ridden society raises some interesting questions about the limits of the theory and practice of citizenship and liberal politics in India. My intention here is to analyse his ideas on equality and justice in the way they complement other themes and concepts in his work. Since many arguments in this paper are part of a larger project, the numerous simplifications may be regarded as tentative and provisional.

To develop the setting for the discussion on distributive justice, I argue in Section I that Ambedkar's critiques of both the role of the Indian National Congress and brahmin domination of society place him in an uneasy position within the discourse of nationalism. In Section II, I examine the views of Gandhi and Ambedkar on equality and distributive justice, which I contend, reflect the differences in their approach towards the abolition of the caste system. In Section III, I critically examine three components of Ambedkar's theory of distributive justice. Having done this, I return briefly, in the final section to argue that while Ambedkar believed both in the basic tenets of liberal politics and a casteless society, the principles behind

the one often contradict those behind the other.

Some of the questions raised in this account are: first why did Ambedkar differ from other nationalist leaders in his analysis of Indian society? What is the concept of swaraj in Ambedkar's account of brahmin domination? How did Ambedkar resolve, if he ever did, the idea of separate electorates with a conception of distributive justice in the struggle for the liberation of dalits? But in focusing on Ambedkar, some might object that I have ignored many other arguments presented in favour of liberation. Before I look at possible answers to these questions I will give some reasons why it is important to look at Ambedkar from my perspective. There are three contemporary debates to which I hope this essay will make a contribution.

First, consider the claims made by the historians of the freedom movement led by the Indian National Congress. The view that the national movement is a 'popular, multi-class movement' is grounded on the assumption that the entire world of political action can be comprehended through the categories of imperialism, nationalism and communalism.³ As a corollary to the above, there is the assumption that the concept of nationalism has a deeper significance and therefore it resists multiplicity and retains its indissolubility despite every attempt to resolve it into subdivisions such as region, class, caste and gender.

Of course, recent history writings, represented for example by the historians of the subaltern school, question these assumptions to a large extent.⁴ But it is surprising how often one reads about 'subaltern' protests without encountering the name of Ambedkar, and his efforts to improve the condition of the dalits. Moreover, these critiques of colonial discourse valorise indigenous communities; this makes impossible sympathetic evaluations

of many movements for women's rights and lower-caste protests which might have utilised aspects of colonial policies and western ideologies.⁵

I will argue that the question of the identity and existence of the nation was addressed by Ambedkar in opposing there elite-led nationalist project. What was the nation, what was national oppression and the way to overcome it, was a common question. What is interesting is his answer which focuses on the oppressive character of the Hindu community based on the principles of the caste system. By arguing for the rights and basic needs of the dalits, he challenges the assumptions of both nationalist politics and indigenous communitarian politics. By choosing to discuss Ambedkar, I hope to point towards histories not neatly preoccupied with anti-colonial nationalism; once ensnared within the 'particularism' of national politics, these leaders found it difficult to maintain focus on social disadvantage as the main fulcrum around which politics should be organised.

The second problem which arises in focusing on Ambedkar is of locating him in the debate on modernity and tradition. Of the various streams which responded to colonialism, Ambedkar could be inaccurately placed, in the category of 'modernists'. This response, as described by Bhikhu Parekh, viewed Hindu society as "beyond hope and their salvation lay in radically restructuring it along modern or European lines".⁶ The modernist programme for the "regeneration of India consisted in creating and using a strong, interventionist, democratic, secular and centralised state to recreate society".⁷ Although they covered a wide spectrum, the proponents of this view were united in their belief that the state stood for modernity and society for tradition.

I believe, Ambedkar articulates the theme of modernity by claiming that individualist

forms of organisation typically replace communitarian ones like the caste system in modern society. He shares much with his contemporaries in the liberal tradition on this project. However, he goes further because he envisions the reconstruction of our existence embedded in social relations characterised by caste groups. Despite his belief in the project of modernity, he departs from other exponents of this tradition by giving new arguments for certain concepts like equality and distributive justice in the colonial context and by adopting a critical position on the European experience. The prospect of moulding India or its institutions in the image of the British had no appeal for Ambedkar. For how else could he turn to Dhamma?

I raise this point because it is of great importance in the current debate on modernity and tradition in political science. Some scholars question this dichotomy by arguing that "a transformed version of this 'traditional' structure had become a vehicle for representative and parliamentary democracy and was functioning as a democratising force". Caste, according to this view, "was anti-caste, in that the horizontal mobilisation of larger lower caste communities was gaining them power, status and wealth which allowed them to challenge and overturn the hierarchy of caste as ritual rank... In this sense, 'traditional' structures and communities of sentiment, identity and action seemed to us by no means irrelevant even to competitive democratic politics and the realisation of egalitarian values."⁸

Now this is very different from what Ambedkar wished to achieve by questioning this dichotomy; he saw the caste system as a serious obstacle in the path of democracy. According to him, democracy lies not in the form of government but in terms of association between the people who form that society. Because Indian society is divided and graded on the basis of the caste system, it is not democratic.⁹

The third problem is to explore how questions of caste have entered into formulations of both Indian and Hindu nationalism. According to Gail Omvedt, even before Veer Savarkar developed a coherent Hindu ideology during the 1920s equating 'Hinduism' and 'nationalism', "the dominant elite ideological trend by the end of the 19th century was that of a revitalised Hinduism equated with nationalism".¹⁰ This is the most difficult area to explore. Ambedkar's relationship to the national movement was complicated and problematic. The fundamental error, Ambedkar believed, was to fail to see the

danger from the views of, not of the orthodox Hindu, whom he had given up years before as hopeless, but of Gandhi and the Congress. Why could he not isolate the obscurantist and parochial current in this confrontation? In sections below, I address the first two questions, and partly look at the third. I should like to examine the latter at somewhat greater length in the future.

INDIAN SOCIETY: AMBEDKAR'S ANALYSIS

The first question which arises is: Why did Ambedkar not endorse the nationalist discourse of this period? There are several answers to this. One explanation for this is given by Omvedt when she writes: "It is impossible to conceptualise the dalit movement in India in the absence of Ambedkar, it is equally difficult to imagine, sociologically, Ambedkar coming of any other region than the Marathi-speaking areas of British presidency."¹¹ Let us explore this a little bit more.

Omvedt refers to the existence of an important tradition of anti-caste movement in Maharashtra that needs to be seen as part of the response to industrialisation and urbanisation. This was the site of the radical movement of Jotiba Phule's Satyashodhak Samaj, and from the time of Tilak, it had also provided a strong base for Hindu revivalism in the form of a Hindu Mahasabha.¹² In fact, the Indian National Congress held its first session in 1885 in Bombay.

There was another reason for Ambedkar's critical position on nationalist politics. He was a mahar, the largest untouchable caste in Maharashtra. His actions, then, according to Zelliot, "were moulded not only by his own personal background, and achievements, and the Maharashtrian thinking of his day, but also by his status as an untouchable".¹³ This group he came from had begun social and political movements before he assumed a position of leadership.¹⁴ Behind this identification with a non-Brahmin group lay the logic of a movement that was essentially anti-caste and not simply a movement for 'untouchability removal' or 'self-reform'.¹⁵ This is not to say that the Mahar movement in the later 19th century was an isolated movement but only to suggest that all these influences constantly streaming in are employed by Ambedkar in a new sense and directed towards a new solution.¹⁶

To what extent does his work, in this political scenario, represent more than a resuscitation of known and traditional ideas and to what extent does it deviate from the traditional mode and contain new and original thought? There is no doubt that

Ambedkar's writings chiefly captured the political tradition of their time: the philosophical views of that time must be at least in part responsible for his dissatisfaction with the nationalist discourse – the new political mood after the Montague-Chelmsford Reforms; an awakening among the minorities for safeguarding their interests in relation to the Hindu majority which pointed towards wider political participation in the national movement. Yet, his thesis does not fit in with the dominant discourse on nationalism. One of the reasons behind Ambedkar's verdict on the national movement and its leaders, I believe, was their general indifference to caste issues. The intelligentsia, as part of the Congress leadership, organised first as social reformers against the British, and also organised as nationalists to challenge many aspects of Indian tradition. But they remained very ambiguous towards removal of the caste system.¹⁷ Linked to the debate on social and political reform was the issue of class. Many communist leaders analysed caste in a mechanical class framework and sought to override traditional identities rather than re-interpret them.¹⁸

Therefore, a plausible explanation could be found in his own solution for liberating the dalits. Ambedkar realised that the identification of Indian culture with Hinduism is incorrect. Because he believed that absorption into Hinduism meant the acceptance of Hindu leadership in the national movement, he felt it would be wiser to take chances with a religion which has many safeguards. At first, he tried to assert the path of radical autonomy, encouraged the dalits to form their own organisations and to deal independently with some basic issues. It means that the dalits themselves "would have to redefine and reconstitute their relations with the whole of Hindu society".¹⁹ But if the dalits were not Hindus, what were they? In fact, a non-Hindu choice seems to have led him finally, to identify with Buddhism.²⁰

At the theoretical level, Ambedkar's language turned out to be singularly open to misconstruals. It was not easy for many to accept the Indian National Congress, social reform organisations and the Hindu Mahasabha as irreconcilable opponents of the dalits; neither was it easy to accept the praise accorded by Ambedkar to the British state for raising the status of untouchables. Even more open to misunderstanding was Ambedkar's critique of nationalism: whereas Ambedkar attacked the Congress for their failure to recognise caste issues, he was erroneously taken to reject nationalism altogether. He was supposed to be

not only anti-national but to advocate a separatist policy which was anti-sectarian as well. Opposed by both traditionalists and Congress leaders, Ambedkar reserved his most bitter attack for Gandhi's reformism.

DISTRIBUTIVE JUSTICE: DEBATE WITH GANDHI

In this section, I examine the conflict between Gandhi and Ambedkar in terms of their ideological difference on the caste system. Both the thinkers approach the matter from quite different angles. I argue that there are real and serious disagreements between them, especially regarding the conclusions that each of them draws from their premises.

Gandhi had two arguments against untouchability: the unity or the political argument and the ethical argument. I shall examine these in turn.

As a leader working for a national goal, Gandhi argued for removing injustices faced by 'untouchables' because he felt the need to weave the divergent interests in India into a unified opposition to the British; he argued for pursuing this course of reform without challenging the social fabric of Indian society. He emphasised that a political separation of untouchables from the rest of the Hindu population would reduce Hindu plurality vis-a-vis other minority groups, in part, the Muslims.²¹

The ethical argument is premised on the view that Hindu society must rest on moral consensus, that political conflict can only be kept within bounds if there is a moral consensus on the caste system. Gandhi's ethical argument rested on two claims. First, he claimed that the heart of the caste Hindu could be changed by applying moral pressures within the framework of the Hindu tradition. Second, there was an obligation on the caste Hindu to be individually responsible towards the lower caste groups. In his conception of the moral or perfect society, Gandhi maintained that its enduring basis can only be the moral calibre of the individuals who constitute it.

Although Gandhi's views changed over the years, he always believed in the *varnashramadharma*, the divinely ordained division of society into four defined groups according to duty: brahmin, kshatriya, vaishya, shudra. In an exchange of views on this problem, he said:

I do not believe the caste system even as distinguished from varnashrama to be an 'odious and vicious' dogma. It has its limitations and defects but there is nothing sinful about it, as there is about

untouchability, and, if it is a bye-product of the caste system, it is only in the same sense that an ugly growth is of a body or weeds of a crop. It is wrong to destroy caste because of the outcaste, as it would be to destroy a body because of an ugly growth in it, or of a crop because of its weeds...²²

Later, he distinguished between caste and varna. In his response to Ambedkar's undelivered speech titled: 'Annihilation of Caste' (1936),²³ he said:

Caste has nothing to do with religion...it is harmful both to spiritual and national growth. Varna and Ashrama are institutions which have nothing to do with castes. The law of varna teaches us that we have each one of us to earn our bread by following the ancestral calling. It defines not our rights but our duties...The callings of a brahmin - spiritual teacher - and a scavenger are equal, and at one time their due performance carries equal merit before god and seems to have carried identical reward before man.²⁴

To this Ambedkar replied, questioning the logical conclusions of his doctrine: "When can a calling be deemed to have become an ancestral calling so as to make it binding on a man? Must man follow his ancestral calling even if it does not suit his capacities, even when it has ceased to be profitable? Must a man live by his ancestral calling even if he finds it to be immoral?"²⁵

Following arguments from justice, rather than arguments for unity, Ambedkar states that existing inequalities cannot be morally defended: to avoid the morally illegitimate exclusion of untouchables one would have to differentiate conceptually and practically between different levels of citizenship.

Ambedkar proposed these arguments when he came into conflict with the Congress, and with Gandhi in particular, on two occasions - the temple entry attempts and separate electorates. Ambedkar put forward arguments based on the principle of liberal equality and distributive justice to sustain his case. Equality meant not the equal status of varnas, but equal social, political and economic opportunity for all.²⁶

At first, he made several attempts to gain religious and social rights for the untouchables, by using the Gandhian technique of satyagraha; drinking water from a public tank in Mahad (1927), temple entry to the Parvati temple at Poona (1929), and then the Kala Ram temple at Nasik (1930-35).²⁷ The failure of temple entry movements demonstrated, according to Ambedkar, that the untouchables were not really a part of Hindu society and would

never be accepted as equals by Hindus within that framework. It was quite obvious that this low threshold concept of a legal conception of equality allows for different degrees of political participation. In short, it does not allow for a corresponding conception of political citizenship. Thus, from a position of questioning the brahmanical social order, Ambedkar moved towards its rejection: raising the issue of conversion by the untouchables in 1935.

But there was another reason. The second occasion was the Round Table Conference held in 1930 at London, where both leaders confronted each other on the issue of the political rights of depressed classes.

Earlier, in the 'Evidence before the Southborough Committee on Franchise' (1919), Ambedkar (invited as a delegate of the depressed classes) had argued eloquently for uniform franchise, for securing access for the depressed classes to the public sphere - to public wells, roads, schools, temples, and cremation grounds - and for special provisions for their adequate representation of their interests and opinions.

Untouchability constitutes a definite set of interests which the untouchables alone can speak for. Hence, it is evident that we must find the untouchables to represent their grievances which are their interests, and secondly, we must find them in such members as will constitute a force sufficient to claim redress.²⁸

After the Round Table Conference, (where he argued against a general territorial electorate for the untouchables), the communal award of 1932 gave the depressed classes, a double vote, one in a special constituency and one in the general electorate - a decision which appeared to recognise untouchables as a minority group outside of Hinduism. Gandhi's response was to enter fast unto death on September 20, 1932. He expressed his argument on the grounds for unity between the two:

a heart understanding between the two, the greatest opportunity of repentance and reparation on the part of the suppressors...I would therefore favour widest possible franchise for the suppressed and establish a convention between the two sections for securing proper election of representatives of the suppressed.²⁹

Under great pressure from other political leaders, Ambedkar relented. However, the Poona Pact, which followed, recognised untouchables as a political category across British India by providing reservations of seats for the depressed classes in the centra

legislature and in the provincial legislature.³⁰ Admittedly, all of these changes had hardly any effect on the economic conditions of the untouchables, but it did set in motion an important process of transformation at the level of ideology which I now examine.

LIMITS OF AMBEDKAR'S QUEST FOR LIBERATION

In a limited sense, Ambedkar's conception of equality and justice derive from the liberal vision and tradition. But given the context of the colonial state, he departs from that tradition and innovates thinking about justice in a remarkably novel way. There are three components of Ambedkar's theory of distributive justice: (a) equality of opportunity for all citizens, (b) critique of Hindu society based on an autonomous ideology, and (c) establishment of a casteless society by removing oppression and domination. There might be other aspects but for the purpose of this paper and my argument, I shall only focus on these. I shall critically examine each in detail to point out the limitations of this project.

Ambedkar accepted a legal and social conception of equality, which I call the formal principle of a liberal conception of equality. It entails the elimination of arbitrary advantages in a social and economic system, irrespective of whether the inequality results from one's choice or that of another.

(a) All social inequalities are unnecessary, and unjustifiable and ought to be removed.

What he also found desirable was the idea of equality of opportunity for all human beings in the social and political sphere.³¹ It was further linked to his argument for more abundant political and civil liberty for dalits. On his account this requires that any government treat all those in its charge as equals, that is, as entitled to equal concern and respect. I also interpret this idea of equality of opportunity as an example of the maximisation of equal liberty. In this view, to demand equality of opportunity is to demand the removal of obstacles that stand in the way of an individual realising his potential.

Ambedkar's initial programmes attempt to integrate the dalits into society and politics through 'modern' political institutions. He put his faith in the constitution and the legislative process, as well as the representative bodies to correct social and economic injustice. Ambedkar's ideal for the low caste groups was to raise their educational standard so that they may overcome the social disadvantages

imposed by their birth, and be in a position to use political power in resolving problems of injustice. His adaptation of western concepts is reflected in the way he used to justify political rights of the dalits based on democracy, fraternity and liberty, in Marathi speeches; he conveyed the implication of these concepts in a single word, *manuski* which means 'humanity'.³²

While Ambedkar saw the prescriptive uses of the concept of equality in moral and political arguments as quite useful, he was conscious of the inequality of treatment based on caste and tradition. To bring about a more substantial equality must involve treating people differently which is contrary to the formal principle. For such reasons he advocated a separatist policy for the dalits which might accentuate caste distinctions at an initial stage but eventually make these identities unimportant. Therefore, Ambedkar insisted on the right to take into account the special claims of certain communities which had for centuries been excluded from position of equality and respect.³³

Departing fundamentally from the individualist premise of the equality principle he proposes:

(1) A theory of rights as legal entitlements casting obligations on the members of civil society. The 'untouchables' had a set of rights and the state a duty to eradicate discriminatory practices. Norms of non-discrimination apply not only to government but also to civil society—corporations, schools, places of worship, etc.

Where the rights theorists of the 17th and 18th century tended to regard right as a faculty of possession, Ambedkar encourages us to stress the relational aspect of rights. The important point here is that these rights are put forward as important elements or vital ingredients in a fully realised human life.³⁴ The core argument is that members of the group suffer because they are neither accorded the same respect nor afforded the same opportunities as other persons or groups. They are prevented from realising their capacities, in other words, they are not treated with full respect and dignity.

(2) The basic human needs of the dalits were not only material (wealth, occupational mobility) but non-material; all have the right to be human and the right to live with dignity and self-respect. Although, he stressed the need for reservation in representative institutions, this is only to acquire equality in other goods. For such reasons, he extended his theory to cover such goods as self-respect, power and honour.

Therefore, I argue, Ambedkar accepted the premise of equality but advocated group-based politics to achieve that goal. The first is constitutive and the second derivative.³⁵ Ambedkar eloquently pleaded the case the necessary priority of community claims over individual rights on the grounds that these departures from formal equality could be justified in the following way:

The anti-discriminatory theme: The anti-discriminatory principle's main purpose is to prevent private practices and legal procedures from stigmatising the individuals involved. This was viewed as necessary given that structural forms of oppression against the dalits were well entrenched. To remedy this social malaise Ambedkar raises the possibilities for political participation of dalits through reservations. It was his view that a legislature 'mainly composed of high caste men, will not pass a law removing untouchability, sanctioning inter-caste marriages, removing the ban of the use of public streets, public temples, public schools...'³⁶

The reparation theme: The other idea was that of historic injustice suffered by the dalits. This theme was proposed to offset the systematic and cumulative deprivations suffered by lower castes in the past. Ambedkar argues that some oppressive cultural practices and social institutions result in injustice and accumulated disabilities for untouchables.³⁷

He was aware of the conceptual incoherence these themes gave rise to when applied to policy issues. But as I have argued so far, this is a derivative political position. In fact, he was to warn of the possibility that these special claims might eat the general rule of equality altogether. Unlike anyone else, he pursued the argument that "the constitution should not only declare that we shall have specific rights that every community will have, but that the constitution should provide ways and means by which we shall be protected in the exercise of these rights".³⁸

The second component of Ambedkar's theory of distributive justice was the construction of an 'autonomous' ideology opposed in fundamental respects to the traditional ideology of varna. The central problem, for him, in this regard was the formulation of a counter-ideology which can bring about radical social change; he was concerned to fight for a new society based on equal concern for all.³⁹ This is evident from his critique of the Hindu community on the following basis: (1) the community as unequal; (2) the community as based on segregation both territorial

and ideological; (3) the closed nature of the community; and (4) the distinction between the public and private sphere.

The first aspect of his critique was directed at the theory of 'chaturvarnya' which makes the principle of graded inequality 'the basis for determining the terms of associated life as between the four varnas'. This is not merely notional, but legal and penal: under this system the shudra is subjected to innumerable ignominies and disabilities so as to prevent him from raising above the conditions fixed for him by law.⁴⁰

The second aspect draws attention to the permanent segregation of people in the Hindu community based on the ideological principle of purity and impurity. He rejects the territorial segregation which accompanies this. While distinguishing between the rights of untouchables and the pure he raises some fundamental questions of citizenship: "But the impurity of the 50-60 million of the untouchables of India, quite unlike the impurity arising from birth, death, etc, is permanent: The Hindus who touch them and become polluted thereby can become pure by undergoing purificatory ceremonies. But there is nothing which can make the untouchables purer... It is a case of permanent, hereditary stain which nothing can cleanse"⁴¹

The third aspect of his critique is directed at the nature of closed religious communities without entry points. In 'Mr Gandhi and the Emancipation of Untouchables' (1945), he points out that the legislative majorities and minorities are political categories which are fluid subject to the process of party formation and electoral practices. But the Hindu and the untouchable relationship cannot be captured by these categories. Their difference is that 'they are separated by a fundamental and deadly antagonism'. Hindus and untouchables are not fluid categories but they are 'fixed as permanent communities'.⁴²

He argues against nationalist attempts to define what it means to have equal opportunities – in terms of having the same distribution of results for major social groups in the public sphere. He revealed the inequality in the social sphere arising out of the nature of closed religious communities, because "most people do not realise that society can practise tyranny and oppression against an individual in far greater degree than a government can... What punishment in the penal code is comparable in its magnitude and its severity to excommunication?"⁴³

On the basis of these propositions, Ambedkar's solution for the dalits – the

establishment of a casteless society – went beyond the liberal framework he was located in. Let me try to reconstruct his argument.

From a liberal point of view, Ambedkar was arguing for an individual's freedom to associate; to form communities and to live by their own terms based on equal concern. A corollary of this is that the individuals should be free to dissociate from such communities.

Again, his view placed great weight on the nature of communities as voluntary associations. But, since membership is determined by birth in a Hindu community, rather than by deliberate choice, it is a coercive association. There is no option of entry for those born outside – even though groups might seek to redefine their boundaries. While superficially attractive, the liberal view of the self as a totally unencumbered and radically free subject seemed plagued with difficulties.

This eventually led Ambedkar to locate the distinction between a (voluntary) political community within which an individual exercises his legal rights, and a (coercive) cultural community within which individuals could not even formulate their aims.⁴⁴ People who have the same rights to citizenship may not have the same cultural rights. A political community, argued Ambedkar, may not be co-extensive with one cultural community, as is envisaged by the nation state. For Ambedkar the two forms of community do not always coincide. This distinction leads him to argue that individuals are free to leave – to renounce – membership and to reconstitute their own community. Here Ambedkar was mistaken in his assertions about liberalism's implications: there was no good reason for any liberal to support him in this. But I believe it is this very justification that inspired him to seek conversion to Buddhism.

In Ambedkar's opinion the transition from British to Hindu masters signified no emancipatory potential for the masses. The fight for a national cause, according to him, misconstrues the role of swaraj: "In the fight for swaraj, you fight with the whole nation on your side. In this, you have to fight against the whole nation and that too, on your own... In my opinion, only when the Hindu society becomes a casteless society that it can hope to have strength enough to defend itself. Without such internal strength, swaraj for Hindus may turn out to be only a step towards slavery."⁴⁵

It is this total programme of societal transformation which constituted his conception of swaraj. Swaraj was not just

freedom from the British, it was a freedom based on distributive justice.

CONCLUDING REMARKS

Ambedkar's critical dialogue with some Congress leaders and his struggles to reform Hindu society occurred within a colonial context. His struggle is not with faith but with false brahmanical beliefs not with religion but with brahmin domination of Indian society. He portrays the nature of the caste system in our society in particular using it to show that Hinduism was incapable of establishing a just political and social order. His view differed from other nationalist leaders and social reformers in that he never claimed higher caste status for untouchables, nor did he ever invoke another claim – that untouchables were pre-Aryan, the original settlers of the land or claimed spiritual equality for lower castes within the Hindu tradition. And most importantly his reforms were not directed towards the caste-Hindus.

Unlike other critiques of brahmin domination and caste hierarchy which focus on the unity argument, Ambedkar's critique provides a justice argument against the caste system. Most nationalists argued that their country was fragmented, deeply divided into a large number of castes, sub-castes and local communities; that is why the Hindus had failed to develop a sense of mutual concern and social compassion. Ambedkar's theory of caste oppressor focuses not only the distributive paradigm (allocation of material goods such as resources, income, wealth or the distribution of social positions, such as jobs) as many contemporary liberal theories do, but also brings out the issues of decision-making (representative institutions for the dalits, division of labour (occupational mobility) and culture that bear on distributive justice) but were often ignored in national assessments of their social structure.

This argument was premised on two views: (a) the problems of dalits would always have a particularity that could not be subsumed under class or national mobilisation; (b) the status of the dalit was 'irreversible' if they remained isolated within Hinduism. Therefore, he formulated dalit liberation in terms of two solutions – political assertion through separate electorates and ideological liberation from Hinduism by converting to Buddhism.

Unfortunately, the very cogency and persuasiveness of his arguments raises questions as to the broader contours of his thesis. Dissatisfied with the dominant proposals for the reform of the caste system Ambedkar undertakes a recovery of

Buddhism as a religion that relates to individuals with dignity and respect. However, Ambedkar's point that Buddhism provides the needed theoretical framework to understand Indian politics has its weaknesses. Indeed, by spending considerable energy exploring key conceptions in Buddhism such as ahimsa, rebirth, karma, etc., Ambedkar leaves us wondering how helpful Buddhism is if the terminology is so open to interpretation.⁴⁶

Behind this solution lay the laudable ideal that responsibility for removing group identity status lies with the dalits themselves, not with the larger dominant society. But it is an explanation that completely ignores the pernicious effects of casteism in the Indian social fabric. On the flip side, Ambedkar's 'self-help' ideology perpetuates the mythical notion of a 'monolithic' dalit community which made it possible for them to confront other parties. But this political legitimisation also pre-empts questions of interest differentiation among the dalits.

This takes us to my final observations. All this is not to deny that in his critique of the caste system, Ambedkar is clearly arguing for expanding the rights of citizenship to the 'untouchables'. At a more substantive level he is pushing the case for a casteless society without oppression. How was this possible in practical politics?

My own view is that these two perspectives are contradictory if the objectives they focus upon – the promotion of political and social equality, the abolition of the caste system – are conceived as aims in themselves. But unlike the abolition of the caste system, I do not believe, in Ambedkar's writings, that liberal politics with their emphasis on rights, equality of concern and respect, or freedom to associate can sensibly be defended as more than an instrumental objective. He believed that the more an individual's rights are restricted due to his caste location – for example by constricting the mobility in occupation, of residence, of religion, etc – the less possibility is there of social and distributive justice. The principles underlying the caste system unlock the mystery to the egalitarian distributive outcomes in other spheres. I do believe that it is an important consideration and one that plays a key role in what I regard as the only cogent justification for removing caste system in Ambedkar's work. He poses the question whether separation, in some fashion, from the larger body politic, may produce more tangible results than have previous strategies (Gandhi's and Shinde's) aimed at integrating them into the system. Hence,

his arguments for separate electorates for dalits should be seen as derivative; equal opportunity in liberal politics was not his ultimate goal. In fact, he wishes to achieve much more.

In the most general sense, the dalit community is reconstructed by analysing the structural antagonism and conflict within the Hindu community: the idea of shared meanings, of normative frames and cultural values is questioned. By developing a theory of oppression of the untouchables by locating their exploitation, marginalisation and powerlessness, he highlights the structural and institutional relations that delimit the lives of the dalits. He also gives prominence to their cultural oppression which means how the dominant meanings of our society stereotype one group.

Ambedkar always thought his account of the role of caste system and its ultimate demise was superior to any other. And as history has shown, he was too optimistic in his predictions and not clear enough in this vision. However, mistaken he was in this analysis and however short-sighted he might appear to many scholars, with respect to the discourse of nationalism, the chief application of Ambedkar's political thought may be seen today to reside in his reflections on social and distributive justice. The subsequent course of Indian politics was to prove him correct; it was not the nation state but its opposite, – irreconcilable political clashes between religious communities and caste-wars that would become the order of the day.

Notes

[This article is a revised version of a paper presented at the conference on 'Colonialism and Liberation', September 19-20, 1997, organised by the Developing Countries Research Centre and Dayal Singh College, Delhi University. I should like to thank the organisers and participants for their remarks and suggestions. I am specially grateful to Neera Chandoke for encouraging me to work further on the paper. Many thanks to Minon Chatterjee for her comments on the final draft.]

- 1 This paper does not address the changes in Ambedkar's political beliefs after 1940 when he became more famous for drafting the Constitution of independent India.
- 2 A 'real' community is one in which individuals participate no longer as members of caste groups but as individuals.
- 3 See for example, Bipin Chandra, *India's Struggle for Independence 1857-1949* (Delhi: Penguin, 1989), pp 24-29.

- 12 This was also the area where women like Tarabai Shinde and Pandita Ramabai raised their voices against brahmin domination. See Gail Omvedt, *Dalit Visions* (Delhi: Orient Longman, 1995).
- 13 Eleanor Zelliot, *From Untouchable to Dalit: Essays on the Ambedkar Movement* (Delhi: Manohar, 1996), p 160.
- 14 The mahar group maintained streets, walls, and cremation grounds, and removed dead cattle in the village. The establishment of British rule in Bombay presidency gave the mahars an opportunity for service in the army, employment in cotton mills, ammunition factories, railroads, dockyards, and as servants in British homes. Two instances initiated them to organise. The first was the agitation for continuing the recruitment of mahars into the army and lower grades of government service. A second reason was the organisation of mahar caste associations under the name of Samvanshya, a sub caste of mahars which took up limited issues of internal reform and education. For details about mahars, see Zelliot, *ibid*, p 156; Jayashree Gokhale, *From Commissions to Confrontation: The Politics of an Indian Untouchable Community* (Bombay: Popular Prakashan, 1996), p 218-28.
- 15 For instance, important efforts were made by Vitthal Ramji Shinde, member of the Prarthana Samaj, who opposed the non-brahmin party and attempted to draw the mahar community into the Congress movement. The Depressed Classes Mission set up by him around this period focused on education and a reformed Hinduism. See Gail Omvedt, *ibid*, p 143.
- 16 Some clues regarding the anti-Congress stance of Marathi leaders are provided by Rosalind O'Hanlon in 'Acts of Appropriation: Non-Brahmin Radicals and the Congress in Early 20th Century Maharashtra' in Mike Shepperson and Cummins (eds), *The Indian National Congress and the Political Economy of India, 1885-1995* (U K: Avebury), pp 102-46.
- 17 For Ambedkar's attack on the thesis that political reform should precede social reform

- see his article published in 1936 'Ranade, Gandhi and Jinnah' in W S, vol 1 (B:ED 1979)
- 18 See for example Omvedt, *ibid*, pp 181-82. The All India Kisan Sabha till 1940 emphasises the need for an agrarian revolution and an anti-imperialist struggle but surprisingly attempts no major analysis of the role of caste. See M A Rasul, *A History of the All India Kisan Sabha*, (Calcutta: National Book Agency, 1974).
- The issue was also not taken up in great detail in this period by the Communist Party till the political thesis was adopted (at the 2nd Congress, February 26 to March 6, 1948). This document includes the need for caste discrimination to be punishable by law. A separate section condemns Ambedkar as a 'separatist and reformist leader'. See MB Rao, *Documents of the History of the Communist Party of India* (Delhi: PPH, 1976), pp 85, 111
- 19 Omvedt, *ibid*, p 134.
- 20 See Ambedkar, 'Away from the Hindus', W S, vol 5 (B:ED, 1989). I do not at any point assert that Ambedkar began with this position; the process of disillusionment with Hindu as well as Congress reformism was long and arduous.
- 21 For a sympathetic reading of Gandhi's views see FN Madan, *Modern Myths, Locked Minds: Secularism and Fundamentalism in India* (Delhi: OUP, 1997)
- 22 M K Gandhi, *Hindu Dharma* (Ahmedabad: Navajivan Publishing House, 1950), p 318.
- 23 Ambedkar's speech was prepared for the 1936 annual conference of the Jat-Pat-Todak Mandal of Lahore. The conference was cancelled by the reception committee on the ground that the views expressed in the speech would be unbearable to the conference. See W S, vol 1, (B:ED, 1979), p 85.
- 24 See M K Gandhi's response to Ambedkar 'A Vindication of Caste' in W S, vol 1, (B:ED, 1979), p 83
- 25 Ambedkar, *ibid*, p 90.
- 26 Ambedkar W S, vol 1 (B:ED, 1979), p 57.
- 27 A Depressed Classes Conference was held in Mahad, a small town south of Bombay in 1927. Several thousands moved in to drink water from a public tank. Consequently, the tank was purified by the town's people. It is beyond the scope of this article to go into history of these memorable events. What is relevant here is that these satyagrahas generated an intense mobilisation process among the untouchables
- 28 Ambedkar, 'Evidence before the Southborough Committee' in W S, vol 1 (B:ED, 1979), p 250.
- 29 Gandhi wrote this letter to P N Rajbhoy, a chandbhar untouchable in Pune. See his conversation with Sardar Patel. Both are cited in Zelliot, *From Untouchable to Dalit: Essays on the Ambedkar Movement* (Delhi: Manohar, 1996), p 167.
- 30 See D Keer, *Dr Babasaheb Ambedkar: Life and Mission* (Bombay, 1954).
- 31 I also endorse that though equality of opportunity is attractively simple it has little to do with equality at all. This formula does not assume the empirical equality of human beings. The problems it gives rise to in this instance are not addressed in this paper
- 32 Zelliot, *ibid*, p 157.
- 33 See for example Ambedkar, 'Evidence before the Southborough Committee' in W S, vol 1 (B:ED, 1979), p 267-68, Ambedkar with the Simon Commission, 'Statement Concerning the Safeguards for the Protection of the Depressed Classes', May 29, 1928 in W S, vol 2, (B:ED, 1982), pp 442-45. He argues for a period of 30 years for the right of the depressed classes for priority in the matter of recruitment to all posts, gazetted as well as non-gazetted in civil services
- 34 Ambedkar argued against the activities of the Harijan Sevak Sangh which was supporting separate schools, wells and hostels: "What the untouchables want is not education, but the right to be admitted to common schools...the untouchables do not want water. What he wants is the right to draw water from a common well." Cited in 'Gandhi and His Fast', W S, vol 5, (B:ED, 1989), p 372; see also 'State and Minorities. What Are Their Rights and How to Secure Them' in W S, vol 1, (B:ED, 1989), pp 395-96.
- 35 I rely for this distinction in liberal political theory on Dworkin. He distinguishes between constitutive and derivative positions. A constitutive position is valued for its sake. It is not necessarily absolute because a theory may contain different and to some degree antagonistic constitutive positions. See his 'Liberalism' in Stuart Hampshire and Scanlon (eds), *Public and Private Morality* (Cambridge: CUP, 1978), p 116.

INDIAN INSTITUTE OF TECHNOLOGY, BOMBAY

Powai, Mumbai 400 076.

Advt. No. N-12/1999-2000

Admission to Ph.D. Programme (For all categories) Spring Semester 1999-2000 session.

Admission in:

1. Aerospace, Chemical, Civil, Computer Science & Engg., Electrical, Mechanical and Metallurgical Engg. and Materials Science.
2. Chemistry, Earth Sciences, Mathematics, Physics, Biotechnology.
3. Humanities and Social Sciences (Economics, Psychology, Philosophy, English, Sociology).
4. Biomedical Engg., Corrosion Science and Engg., Energy Systems Engg., Environmental Science and Engg., Industrial Engg. & Operations Research, Reliability Engg., Systems and Control Engg.
5. School of Management, School of Information Technology.

Details about eligibility, etc. are given in Information brochure which can be had along with the application form on payment of Rs. 300/- (100/- for SC/ST) by Demand Draft drawn in favour of Registrar, IIT Bombay, payable at SBI Powai, enclosing a self-addressed stamped envelope 27 cm x 12 cm of Rs. 15/-.

Financial Support (Teaching Assistantship):

For B.E./B.Tech/M.Sc./M.A./M.Com. or equivalent with GATE/NET/CEED/UGC/CSIR/NBHM Rs. 5000/- p.m. For M.Tech./M.E. or equivalent Rs. 6000/- p.m.

For SC/ST Candidate, reservation is as per rule.

For Information Brochure you can also visit our Website://www.iitb.ernet.in

Last date for receipt of completed forms: 29th October 1999.

Forms are issued round the year, however, completed forms received after this date will be considered in the next semester.

Deputy Registrar (Academic)

Growth of Literacy in Kerala

State Intervention, Missionary Initiatives and Social Movements

E T Mathew

Contrary to the widely-held view which gives 'enlightened' native princes much of the credit for the widespread of literacy in Kerala, the educational transformation of that part of the country was triggered mainly by Christian missionaries (19th century) and movements for the uplift of deprived communities (first half of 20th century).

AMONG the low-income countries/regions of the world Kerala is widely cited as a unique example of high social development coupled with low economic development. It is well known that Kerala is far ahead of the rest of India in respect of the key indicators of social development, such as literacy, infant mortality and life expectancy. In fact, its achievements in this field compare favourably with those of several developed countries. No wonder that development literature is replete with laudatory references to Kerala's achievements [United Nations 1975, Sen 1994, Dreze and Sen 1995].

This paper discusses how the state reached its present pre-eminent position in respect of one of the key indicators of social development, namely, literacy. In particular it highlights the relative contributions of different agencies/institutions to making Kerala the most literate state in the country. It argues that contrary to the commonly held view that it was primarily the benevolence of native princes and their progressive policies that triggered educational development in the state, the efforts of Christian missionaries during the major part of the 19th century and of the social reform movements during the first half of the present century took the lead in the educational transformation of Kerala.

The role played by the state and the initiative taken by it is often exaggerated. Here is an example. The census commissioner of Travancore (the major constituent of present-day Kerala) stated in his report for 1941 that the high level of literacy achieved by the princely state was the result of successive rulers' personal interest in the educational uplift of the people (Census of India 1941, Vol XXV, Part I, p 155). In support of this assertion, the report referred to the rescript (edict) issued by Rani Gouri Parvati Bayi in 1817 directing that the state (Travancore) "shall defray the entire cost of the education of its people in order that there may be no backwardness in the spread of enlighten-

ment among them, that by diffusion of education they might become better subjects and public servants, and that the reputation of the state may be advanced thereby". Discerning scholars have, however, pointed out that the credit for this proclamation should go to Colonel John Munro, the British Resident (1810-19), who was also the 'dewan' of Travancore for a short period and not to the rani who was then only in her early teens and grossly ignorant of statecraft [Nair 1978: 40].

Since the princely rulers of Travancore were in many respects far more enlightened than their counterparts in the rest of India they took keen interest in the education of their subjects. But functioning as they did in a highly caste-ridden society, the rulers, in spite of their best intentions, most often proved ineffectual in ensuring educational opportunities for members of all castes and communities. Throughout the 19th century the Travancore government did practically nothing to promote education among backward and depressed communities – which together accounted for nearly half the state's population – or among women. This writer contends that the early efforts at the education of the backward classes and women came not from the state, but from the missionaries. In his administration report for 1862-63, the dewan, Sir T Madhava Rao, confessed that very little was done for female education [Pillai 1940: 692]. It was the grant-in-aid education code of 1895 which for the first time provided funds for the establishment of schools for backward classes in Travancore [Travancore Census 1931: 433]. In spite of the concerted efforts of the missionaries, literacy among the vulnerable groups remained extremely low throughout the 19th century.

For breaking the strong casteist barriers to education (and several other aspects of social life), the state had to await the emergence at the dawn of the present century of several powerful social reform movements – such as the Sree Narayana Dharma Paripalana Yogam (SNDP

Yogam), founded in 1903 under the leadership of Sree Narayana Guru (1855-1928) and the Travancore Sadhu Jana Paripalana Sangham, founded in 1907 under the leadership of Ayyankali (1863-1941).¹ The SNDP Yogam led many agitations for ending discrimination against the ezhava community. These agitations were later reinforced by the alliance forged among ezhavas, Muslims and Christians for fair representation in public service and for the total removal of all kinds of discrimination based on caste and community.

It was this alliance which eventually led to the formation of the Travancore State Congress, which spearheaded the freedom struggle in Travancore. In the wake of independence and the establishment of democratic rule based on adult franchise, the backward and depressed castes/communities acquired sufficient political clout to wrest their due share of rights and privileges from the government.

Since the high rate of literacy in Kerala has been largely due to the relatively rapid progress made by the former princely states of Travancore and Cochin, the discussion in this paper will be based on developments in these two regions, especially Travancore.

Broadly three periods are distinguished for the purpose of the discussion: (1) The 19th century, during the major part of which foreign missionary initiative was prominent and close co-operation existed between the state and the missionaries in their educational efforts. In the late 19th century the educational efforts of the foreign missionaries were in several cases supplemented and in a few instances replaced by the indigenous churches. (2) The first half of the 20th century, during which several powerful social movements played a decisive role in the promotion of education. (3) the 43-year period since the formation of Kerala state, when the elected representatives of the people and the governments in power became more responsive to the economic and social

aspirations of different sections of the population, especially the educationally backward regions in northern Kerala. Since developments during this period are more recent and better known, this paper will make only a brief reference to this phase.

19TH CENTURY SOCIAL SCENE

For those familiar with only the present, positive aspects of the 'Kerala model' of development, it would be rather shocking to learn that Kerala in the 19th century was a highly conservative, hierarchical and caste-ridden society. According to Travancore census of 1854, the Hindu society consisted principally of brahmins, nairs, backward communities (mainly *ezhavas*) and slave castes (mainly *pulayis*). Brahmins were the only class which, free from all social and religious disabilities, enjoyed near-absolute freedom of action.

All castes below the nairs were treated as low castes. The lowliest of the low in the hierarchy were *pulayis*, *pariahs* and *kuravas* who were *agrestic slaves*. Untouchability and even unseeability was in vogue.² The members of the slave castes could be let on hire or transferred at the choice of the owner, offered as presents to friends or as gifts to temples, and bought, sold, or mortgaged in the same manner as the land on which they dwelt or as the cattle and other property of their owners. The price of a slave varied from Rs 6 to Rs 9 [Mateer 1870:43].

The general circumstances of the backward communities (*shanars* and *ezhavas*) in Travancore were 'most humiliating and degrading'. They were not allowed to carry umbrellas, use footwear or gold ornaments or carry pots of water on the hip. *Shanars* were also forbidden to build houses of more than one storey in height, milk cows or even use the ordinary language of the country [Mateer 1870:41]. Most abominable of all is the fact that the *shanar* women were forbidden to wear any clothing above the waist.

The prevalence of untouchability and 'unapproachability' had for centuries prevented members of the lower castes from acquiring education of any kind except the knowledge handed down from ancestors by word of mouth. Even when institutionalised education began, the only recourse of these people consisted of schools run by the missionaries. Missionary schools which admitted lower-caste children were under the constant threat of withdrawal of the upper-caste pupils. It was this milieu which kept literacy rates in Travancore relatively low.

Discrimination on the basis of caste was not confined to Hindu society. The Christians of Travancore were subjected to several disabilities at the beginning of the 19th century despite their having received rights and privileges from the rulers in earlier periods.³ Church historian Agur has given a graphic description of the torments and tribulations which the Christian communities had suffered [Agur 1903: 52-55]. Not only Syrian Christians, who have always enjoyed a higher social status than those newly converted to Christianity from lower Hindu castes, but even Europeans were subjected to caste barriers.⁴ It was in such an environment that British supremacy was established and along with it missionary enterprise.

HERALDING MISSIONARY ACTIVITY

A few events occurred in quick succession towards the end of the 18th century and during the first two decades of the 19th century which paved the way for Protestant missionary enterprise in Kerala. The earliest among them were the formation in 1795 and 1799 respectively of the London Missionary Society (LMS), consisting of Evangelicals, Anglicans and Dissenters, and the Church Missionary Society (CMS), constituted by an evangelical group within the Church of England to help in the propagation of the Gospel in Africa and the east. The second event was the addition of two clauses to the charter of the English East India Company, largely as a result of the pressure exerted by evangelicals led by William Wilberforce when the charter came up for renewal by the British Parliament in 1813. The two clauses related to the formation of a regular church establishment in India and the practice of issuing licences to missionaries for preaching in India.

The third event had a direct bearing on Kerala (Malabar as it was known in those days). It was the visit to Travancore in 1806 of Rev Dr Claudius Buchanan, chaplain of the English East India Company in Calcutta, whom Lord Wellesly, governor-general of all the British possessions in eastern India, had deputed to inquire into the state of Christians in Malabar. Buchanan travelled extensively in the princely state, visited Mar Dionysus, the metropolitan of the Syrian Church, and several ancient Syrian churches. During his interview with the metropolitan, Buchanan proposed the establishment of schools in all the 55 parishes of his (the metropolitan's) diocese. However, no concrete step to

help the Syrian Christians was initiated till the time of Colonel John Munro, resident of Travancore and Cochin.

The fourth event consisted of a political development of far-reaching significance – the establishment of British overlordship in Travancore and Cochin and the appointment of a British Resident in these princely states. Briefly stated, the invasions of Hyder Ali and Tippu Sultan of Mysore tightened the grip of the East India Company on Travancore and Cochin. By a treaty concluded with the company in 1791 the Cochin raja undertook to become a vassal of the English and to pay an annual tribute. In 1795 a formal treaty was concluded between Travancore and the company according to which the raja accepted British supremacy; Colonel Colin Macaulay⁵ was appointed British Resident in Travancore as well as Cochin in 1800. A fresh treaty of 'alliance and friendship' concluded between the company and Travancore in 1805 conferred on the former the specific power to interfere in its internal affairs in the event of internal strife or rebellion. The raja also undertook to abide by whatever advice the company might choose to give him in regard to the internal administration of the state [Menon 1967, Government of Kerala 1970].

ENTER PIONEER MISSIONS

Colonel Macaulay helped Claudius Buchanan in his labours and research among the Syrian Christians of Travancore. Munro, who succeeded Macaulay as Resident (1810-1819), was still more zealous in the cause of Christianity. He sent an appeal to the corresponding committee of the CMS in Madras asking for a few clergymen of the Church of England to work among the Syrian Christians of Travancore and Cochin. Accordingly, the CMS decided to send a 'mission of help' to the Syrian Church.

Rev Thomas Norton, the first CMS missionary deputed to Travancore, landed at Cochin in May 1816 and settled at Alleppey at the suggestion of Munro. In 1817 he established his first school, with 40-50 children, in the Alleppey mission compound. This was the first CMS primary school established in central Travancore. By 1839 Norton had eight village primary schools with a total strength of 289 pupils [Eapen 1985]. In November 1816 Benjamin Bailey and his wife arrived, and they chose to move to Kottayam in central Travancore, in March 1817. Subsequently missionaries Joseph Fenn and Henry Baker also arrived in Kottayam.

After the arrival of Bailey, Fenn and Baker, Norton gradually withdrew from

the 'mission of help' to the Syrian Church and concentrated on his individual educational efforts in and around Alleppey. The Nortons also took keen interest in the education of girls. In 1820 Norton's wife established a girls' school at Alleppey with 13 pupils; the number rose to 18 in 1829 and 36 in 1840 [Agur 1903:768, Eapen 1985:58]. Norton admitted pupils from all communities in his schools – Hindus (nairs, vellalas, chetties, arayans), Muslims and Christians [Catholics as well as Protestants]. The credit for introducing the modern system of primary education according to many observers, goes to Norton [Eapen 1985:59].

Thomas Dawson, a missionary who had arrived with Bailey, remained in Cochin and engaged himself in the education of the local Jewish community. He established a school for Jews at Mattancherry. With the permission of the raja of Cochin he opened another school at Cranganur. The Dawsons were succeeded by Samuel Ridsdale in 1820. He opened six boys' schools with an enrolment of 294 pupils and four girls' schools with a strength of 64 pupils.

As indicated earlier, the aim of the mission of help was to establish a school in every Syrian parish. The parish schools were vernacular primary schools attached to the church. The first such school was established by Bailey in 1817. In a royal 'neet' (grant) Rani Parvathi Bayi, the then ruler of Travancore, made a gift of land for the school in 1818. The CMS committee offered an incentive of Rs 2-3 per mensem to any person who brought in 30 children to a school [Eapen 1985:62]. The growth of parish schools during the early decades of the 19th century may be seen in Table 1.

The partnership between the Syrian Church and the mission of help came to an abrupt end in 1836 due to serious differences between the two parties. From then on the CMS mission functioned independently as a unit of the Anglican Church in India. The CMS missionaries began devoting more attention to other sections of the population, especially the outcastes. Several schools came to be established under each of the new 'mission stations' established in many parts of Travancore and Cochin. In 1878 there were 141 schools under CMS management with 4,665 pupils including 134 primary schools with 4,113 pupils [Eapen 1985:75]. At the time of its centenary of missionary activities, celebrated in 1916, the society had 307 schools – mostly primary schools – out of which 244 schools received grants-in-aid from the government

and the rest were recognised schools financed by the CMS itself [Eapen 1985:83].

This paper discusses next the LMS's educational efforts in Travancore and Cochin. Kanyakumari, a district of present-day Tamil Nadu, was part of Travancore till the formation of the Kerala state following the reorganisation of states along linguistic lines in 1956. The LMS played a major role in the educational development of southern Travancore. Its educational activities began with the arrival of Rev William Tobias Ringeltaube in Trivandrum in May 1806 after spending more than a year learning Tamil at Tranquebar. It is worth mentioning that the British Resident had procured a passport for the missionary's travel to Travancore and offered to meet his travelling expenses.

Though initially Ringeltaube wanted to settle in Mylaudy, he withdrew to Palamcottah (in present-day Tamil Nadu), in British India, as Velu Thampy, dewan of Travancore, had denied him sanction for building a church there. Due to the direct intervention of Resident Macaulay, however, Ringeltaube eventually received permission to build Travancore's first Protestant church, the foundation for which was laid in May 1809. Ringeltaube's interest in education was kindled by Munro, who in 1813 addressed a series of queries to him about the condition of the Mylaudy Protestant mission. One such query related to the existing state of the educational facilities available to the clergy and the youth.

By the time Ringeltaube left Travancore in February 1816 he had established seven single-teacher schools with a total enrolment of 188 pupils. The curriculum consisted of reading, writing and arithmetic. The missionary, however, lamented the fact that girls never came to school in Travancore [Agur 1903:596]. Munro was as much a benefactor of the Mylaudy mission as he was of the mission of help to the Syrian Church. He obtained from the rani of Travancore, between 1814 and 1819, three paddy fields at very nominal land tax for the support of the Mylaudy mission.

Ringeltaube was succeeded in December 1819 by Rev Charles Mead, who spent 56 years of his life in Travancore and has been called the father of the south Travancore mission. In October 1819 Mead opened a central school or seminary at Nagercoil, admission being restricted to 30 boys. With the active co-operation of Mrs Mead a boarding school for girls was also opened. The Nagercoil

seminary was the first English school opened in Travancore. It was raised to the status of a second-grade college in 1893. While increasing the number of congregations after Ringeltaube left from seven to 15, Mead was far-sighted enough also to provide for a school in each congregation. The Rev Charles Maull joined the south Travancore mission in December 1819 to assist Mead, whose health had been deteriorating steadily.

At the beginning of 1820 the mission started a school in the Nagercoil bazaar to meet the needs of the non-Christian public. This school had 50 pupils two years later. A school of industry was formed in 1820 to provide 'means of subsistence and the advantages of a Christian education at the same time'. Training in 'useful arts' such as printing, bookbinding, tanning and curing leather was imparted in this school. By 1824 the number of schools run by the south Travancore mission had risen to 47, with a total of 1,300 pupils.

For many years the government refused permission for a Christian mission to be established in Trivandrum. In 1838, however, Rev Cox helped by the patronage of Resident Fraser was permitted to commence a mission. The raja granted a plot of land at Kannammoola (Trivandrum) for setting it up. Eight years later there were 14 schools for boys and three for girls under LMS's Trivandrum mission [Agur 1903: 877].

On Mead's retirement from the south Travancore Protestant mission in 1853, General Cullen, the Resident, appointed him the first superintendent of government schools in Travancore. One of his major educational initiatives was to amalgamate the district English schools and the 'vernacular' schools in 1860.⁶

The educational activities of the LMS in Travancore made steady progress. In 1904 the society had 384 schools with 15,641 pupils under its charge [Aiya 1906:447]. These schools were of different levels and types. While we do not have detailed statistics relating to them, it is abundantly clear that the LMS made a substantial contribution to the growth of literacy in Travancore, particularly among

TABLE 1: GROWTH OF PARISH SCHOOLS

Year	No of Schools	No of Teachers	No of Pupils
1819	2	2	66
1821	10	9	253
1824	51	51	1333
1826	29	29	770
1836	25	27	787

Source: Eapen 1985: 63

the lower castes, during a period when educational facilities were virtually denied to them.

EDUCATING VULNERABLE GROUPS

Kerala's superior performance in literacy vis-a-vis the rest of India has been due largely to its unmatched lead in the education of women and the depressed communities. The missionaries had targeted these segments in their educational endeavours throughout the 19th century, whereas the state remained indifferent or passive for most part of the century.

Both the CMS and the LMS accorded the utmost priority to female education. In fact, the promotion of female education can be reckoned as one of the magnificently unique contributions of the Protestant missionaries. While the bulk of the schools established by them were co-educational as a matter of policy, these missionaries also opened many girls' schools. As already noted Mrs Norton, wife of a CMS missionary, established a girls' school in 1820 [Eapen 1985:147, Agur 1903:768]. Mrs Benjamin Bailey had a few girls under instruction at her own home, at her own expense, soon after her arrival at Kottayam in 1817. Mrs Henry Baker (Sr) opened a formal school for girls in Kottayam in 1819.⁷

While the missionary ladies laboured in the cause of female education with great dedication during the early part of the 19th century, the government was 'supremely indifferent in the matter'. In his administration report of Travancore for 1862-63, Sir T Madhava Rao, the dewan, candidly admitted that the government had done little for female education in Travancore. At this time there were only two government schools for girls in the state – one at the Trivandrum cantonment, started in 1858 for the education of Christian girls, and the other at Karamana (Trivandrum), opened in 1859 for the education of Brahmin girls [Pillai 1940:692-93, Agur 1903:770-71]. Note that while the first missionary school for girls was established in 1819, the first government school for girls was opened only about 40 years later.

It was soon realised that to promote girls' education female teachers in adequate numbers were required. A 'normal school' to train female teachers was established by Mrs J Johnson around 1848. It was the first teachers' training school in Kerala. Later it was merged with the Baker Memorial Girls' School in Kottayam.

Thanks to the inspiration provided by the initiatives of Mrs Norton in Alleppey and Mrs Bailey and Mrs Henry Baker (Sr)

in Kottayam, several girls' schools were subsequently established at leading mission centres in Travancore. They included Mrs Joseph Peet's school at Mavelikara (1838), the school of Mrs Henry Baker (Jr) at Pallom (1871) and Mrs John Chapman's school at Kottayam (around 1847) [Eapen 1985:144-51]. Some of these schools were residential.

The CMS missionaries did not confine their activities in the cause of female education to Travancore. Their efforts reached out to Cochin state also. In Cochin the first girls' school was established by Mrs Samuel Ridsdale, wife of the CMS missionary in the state, in 1826. Three more girls' schools had been opened by her by 1836. Strangely, the four schools together had a strength of only 64 pupils. Mrs Ridsdale is rightly remembered as the pioneer of female education in the former Cochin state. Mrs Henry Harley, who succeeded Mrs Ridsdale in 1836, established a boarding school for girls in Cochin, which was shifted to Trichur in 1841.

J H Bishop, CMS missionary at Trichur [1880-1913] took keen interest in education. Mrs Bishop conducted a boarding school for girls in the mission compound; most of the pupils were drawn from upper caste Hindu families. There were two other CMS girls' schools in Trichur. Kunnankulam, which in course of time emerged as an important CMS mission centre in Cochin, also had several girls' schools. In 1854 it already had three schools for girls [Eapen 1985:152-54].

No account of the contribution of the CMS missionaries to the cause of female education in Kerala would be complete without mention of the work of the Church of England Zenana Missionary Society (CEZMS), which worked in close co-operation with the CMS in Kerala. Augusta Blandford, the first CEZMS missionary in Kerala, founded the Fort School for Girls in Trivandrum in 1864. This school, started mainly for the education of caste Hindu girls, received the patronage of the Travancore royal family. The CEZMS established girls' schools at Mavelikkara, Kottayam, Olessa, Ernakulam and Trichur as well. In 1906 there were 15 schools under the zenana mission.

The LMS missionaries were equally zealous in promoting female education. As a rule, the schools they established in south Travancore were coeducational. However, parents were generally reluctant to send their daughters to schools. In reply to a query sent by Munro, Ringeltaube replied that girls never came to school in Travancore, which was a great loss. Mead, Ringeltaube's successor, and his wife

opened a boarding school for girls in 1819. It is pointed out that so great was parental prejudice against the school that girls enrolled during a week "were withdrawn during the next week". Apart from the usual subjects like arithmetic and geography, Mrs Mead taught sewing, spinning, knitting, etc, and Mrs Mault crochet, embroidery and pillow lace work [Agur 1903:766-69]. The school started with 14 girls, all of whom were given free boarding.

In 1828 when Mead shifted residence to Neyoor, a girls' boarding school was established there too. Among the many early efforts made to encourage girls' education in Travancore was the publication in 1831 of a tract in Tamil – 'On the Advantages of Female Education', printed at the LMS press at Nagercoil – which was distributed free of cost [Agur 1903:769].

Of the second-generation missionary ladies labouring in the cause of female education in Travancore, mention may be made of Mrs Abbs, who founded a school at Parachalayi (Parassala), Mrs Lewis one at Santhapuram, Mrs Cox one at Kannamoola (Trivandrum) and Mrs Thompson one at Quilon. Around these boarding schools, a number of 'village day schools for girls' were formed. In 1837 there were in south Travancore 15 such village girls' schools with a total enrolment of 361 pupils. The strength increased to 1,468 in 1857 [Agur 1903:769-77].

DEPRIVED COMMUNITIES

The Protestant missionaries' efforts to bring the deprived communities to school were extremely strenuous. At the early stages they met with failures and breakdowns. For instance, the first school for the education of slave-caste children, opened by CMS missionary Norton at Alleppey in 1835, did not survive owing to lack of interest on the part of the pupils. Fenn opened a school for slaves on Munro Island in 1835 and Baker (Sr) one at Kottayam in 1836. The schools faced vehement opposition from slave-owners.

Joseph Peet, missionary in charge of the CMS district of Mavelikara and a great liberator of the depressed classes, opened several schools chiefly for the benefit of ezhavas and pulayas. One guiding principle was that upper caste children should attend the same schools as the lower caste children. In spite of resistance from vested interests, Peet had 58 village schools under his charge in 1878, including 15 exclusively for the benefit of the pulayas.

In the Tiruvella mission's jurisdiction the first slave school was opened in 1850. It angered the higher castes so much that

the school building was set on fire more than once [Eapen 1985:171]. In spite of such provocations, the movement for the education of slaves gathered momentum and several schools sprang up in other parts of the jurisdiction, thanks to the initiative of John Hawksworth. In 1849 Hawksworth established two boarding schools for the benefit of the slave classes, one for boys and another for girls. In addition to vernacular primary education, the mission also provided English education in these boarding schools.

Baker (Sr) established a slave school in Kottayam in 1836. By 1860 or thereabouts more such schools had been opened in different parts of Kottayam such as Olessa, Velur and Kumarakom. Baker (Jr), son of Baker (Sr), established a slave school at Mundakayam in a shed of bamboos thatched with elephant grass around 1849. Samuel Ridsdale, who served as CMS missionary at Cochin between 1826 and 1836, also made some attempts at educating the slave classes.

During the early periods of missionary enterprise, separate schools were maintained for the slave classes: the higher castes did not favour the idea of their children attending the same schools as the children of the slave castes. According to the Proceedings of the CMS for 1918-19, 205 primary schools in all were run for slave classes, chiefly pulayas and pariahs, with a total enrolment of 6,021 pupils [Eapen 1985:175]. The educational experience of *chhava* children during the entire 19th century and the first decade of the 20th century was not different from that of slave-caste children.

The CMS missionaries also took keen interest in the education of a hill tribe known as 'Hill Arrians' (Mala Arayans). The establishment of a one-room school at Mundakayam in 1849 by Baker (Jr) was the mission's first attempt in this direction. This school grew into an English high school in 1939. Baker established schools for the education of the tribals in other parts of the western ghats as well, including Peermade (1850), Erumapra (1851), Koottickal and Melukavu (1852), Kannikkal (1853), Koovapally (1872) and Valakam (1873). The school at Melukavu grew into a high school in 1968 [Eapen 1985:178-79].

As already noted, during the early decades of CMS missionary enterprise in Travancore separate schools were established for 'slave' and other low-caste children. But in course of time these schools were thrown open to all castes and creeds. When Richard Collins was the principal of the CMS college, Kottayam (1855-65),

the admission of an outcaste student caused so much commotion that he was withdrawn from the college. In a few years, however, the hostility subsided and the college began to admit students from all disadvantaged caste groups.

Opposition to the admission of low-caste children continued much longer in Cochin. An effort to admit them to the English missionary school at Trichur in 1889 was vehemently opposed both by the upper castes and by the government. The missionaries, however, persisted in their efforts, and in 1923 the restrictions were scrapped by a special order of the Cochin government. The admission of three backward-community students to the Cambridge Nicholson Institution (CNI) at Kottayam had raised a storm of upper-caste protest even as late as in 1907. But the missionaries stood firm, and the CNI later became a vernacular middle school for the education of backward classes.

Note that the CMS missionaries began to admit lower-caste children to their schools long in advance of the governments of Travancore and Cochin. It was only with the introduction of Mitchell's Education Code in 1910 that caste-based discrimination in the matter of admissions to schools was abolished in Travancore. The government of Cochin took such a step nine years later. But even after the legal removal of the impediment, instances of upper-caste of pupils boycotting classes because of the 'polluting presence' of lower-caste children continued [Rajendran 1974:24].

The LMS missionaries' role in promoting education of the slave-caste children was not different from that of the CMS. Mead made a startling announcement (circa 1850) that schoolmasters who brought slave-children to school would get an additional payment of one 'fanam' (one-seventh of a rupee) for every slave boy and one and a half 'fanam' for every slave girl admitted to the Christian schools. Within a year more than 1,000 slave children were enrolled in the schools in the Neyoor mission [Agur 1903:892-93]. After moving to Trivandrum in 1855 Mead established (circa 1860) a school for pulayas in the Trivandrum cantonment. The LMS's efforts also substantially helped the educational advancement of the shanars, who constituted a sizeable proportion of the population of south Travancore.

ROMAN CATHOLIC MISSION

As we have seen, Protestant missionaries (all of them from England with the single exception of Ringeltaube) were responsible for the introduction of modern education

in the former princely states of Travancore and Cochin during the first half of the 19th century. Although several Roman Catholic (Latin) churches in Travancore and Cochin trace their origin to a period prior to the coming of the Portuguese, the advent of regular Roman Catholic missions in Travancore began only with the establishment of Portuguese power [Agur 1903:200]. Francis Xavier, who came to the Malabar coast as a Jesuit missionary in 1542, travelled extensively through the coastal fishing villages and converted large numbers of 'mukkuvars' and 'paravars' (Hindu fishermen communities), who came to be known as Latin Catholics as distinguished from the Syrian Christians who were converted to the Catholic faith [Mateer 1870:230-31, Agur 1903:208-11, 390-91].

For most of the 19th century the contribution of Catholic missionaries to the educational development of Travancore and Cochin was minimal. Conflicting explanations have been offered for this. According to one view, the Catholic missionaries were not much to blame as most of them were Italians, Spaniards and men of other nationalities who found great difficulty in taking active part in English education [Agur 1903:418]. According to a less charitable view the Portuguese Jesuits and Italian Carmelites who played a dominant role in the administration of the Catholic church did not have any real interest in modern education, particularly English education. For them the English language itself was symbolic of the Anglican rebellion against Roman Catholic supremacy in Europe [Tharakan 1984:40].

The Catholics, particularly the Syrian Catholics, made significant progress in establishing schools only as of the 1880s.

SYRIAN CHRISTIAN ENTERPRISE

The introduction of a liberal system of grants-in-aid for the first time in 1868-69 gave a substantial boost to private enterprise in education, which the local churches took advantage of. During an epoch of intense rivalry among different factions of the indigenous Syrian Church, opening a grant-in-aid school in the parish became, according to some observers, one sure way of ensuring the loyalty of the parish leaders. The number of such schools under the indigenous Mar Thoma Syrian Church rose from 134 to 195 between 1879 and 1895 [Jeffrey 1976:124].

The Syrian Catholics did not start conducting well-organised, large-scale educational activities until the late 1880s. There were only five grant-in-aid schools under Roman Catholic management in

1885. The number of grant-in-aid schools under Syrian Catholic management, however, increased to 25 in 1890 and 49 in 1895 [Jeffrey 1976:124]. Father Immanuel (Mani) Nidhiry, Pontifical Vicar General (1889-1892) was a leading figure among the Romo-Syrians in championing the cause of modern education. He accorded the highest priority to opening English schools. In one of his speeches he is reported to have said that an English school would be more of a prized asset than the gold crosses of churches – which could be stolen [Tharakan 1984:50].

A major factor which helped Syrian Christian (Jacobite, Marthomite and Catholic) educational expansion was the availability of liberal grants-in-aid from the government. By the end of the 19th century indigenous Christians contributed relatively more than the missionaries to the educational development of the state (Table 2).

It is important to note that the above data covers schools not only in Travancore but also in Cochin and perhaps (a few) in Malabar. Besides, it includes unaided as well as aided schools. In fact, since the grant-in-aid code was very strict,⁸ many schools did not qualify for aid. As a result unaided schools far outnumbered aided schools, as shown by Table 3.

It is observed that enrolment in unaided lower primary schools accounted for 55.5 per cent of the total enrolment – covering government, aided and unaided lower primary schools. In promoting literacy among the people, the unaided lower primary schools obviously played a major role. It may also be noted that the unaided schools included also the 'pyall schools', which have disappeared with the passage of time.

GOVERNMENT'S ROLE IN EDUCATION

The establishment of the Rajah's Free School in Trivandrum in December 1836 marked the first attempt of the government to impart modern education [Aiya 1906:447]. About the same time, several district English schools were opened at centres like Kayamkulam, Kottar and Chirayinkil and placed under the supervision of J Roberts, who was succeeded by Rev C Mead in 1855 as superintendent of education. There were 22 district schools in 1887. The question of improving vernacular education engaged the attention of the government only during 1865-66. Of course, there were many private vernacular schools in Travancore – pyall schools – before that time. About 1,300 such schools with a total of 50,000 pupils existed in 1891.

In 1866 a 'central school' was opened in Trivandrum and also a school in every taluk in the state. There were 29 vernacular schools attended by 2,152 pupils at the end of 1868-69. Another important step was taken in 1871 with the establishment of village schools. It was soon realised that public expenditure on vernacular education was proving to be burdensome to the government and this led to the encouragement of private agencies through the grant-in-aid system. The number of aided schools rose from 437 to 1,375 between 1881 and 1893 [Aiya 1906:457].

The grant-in-aid code was revised in December 1894. The new rules, known as the 'Travancore educational rules', related to the qualifications of teachers, buildings, accommodation and sanitation, furniture and educational appliances, admission of pupils, etc. A revised curriculum of studies was introduced in 1902, and the schools were classified as high, middle, upper primary and lower primary. In the last two sets of schools the vernacular was introduced as the chief medium of instruction. English was taught only as the second language.

Female education: As we have noted earlier, while the missionaries were very active in setting up schools for female education, the government remained rather indifferent. The first concrete step was taken only as late as 1865-66 when the government took over the management of a private school which had existed at the Trivandrum cantonment for a few years. It is this school which was raised to a second-grade college for women in 1897. Out of a total of 3,894 ordinary schools (schools other than training schools and special schools) in the state in 1903-04, girls' schools numbered only 182 and the majority of them were run by the missionaries [Aiya 1906:470].

Education of backward classes: In 1855, when slavery was abolished in Travancore, children belonging to backward and depressed (slave) castes did not have access to government schools. Only after the grant-in-aid code was revised in 1894-95 were

funds provided for grants to schools meant for backward classes.¹⁰ The government followed up this initiative in 1895-96 by opening 15 schools for backward classes: four schools for Muslims, seven for ezhavas, two for pulayas, one for marakkans (fishermen) and one for kani (tribals). Another 15 schools were added the following year. About the middle of 1904, the government convened a conference at which it was decided that the government should meet the entire cost of the primary education of the backward classes.

The term 'backward classes', however, excluded converts to Christianity. Further, one of the conditions for eligibility for grant-in-aid was that at least 75 per cent of the total number of pupils in the register should belong to one or the other of the castes recognised as backward by the government's order of 1904.

It is extremely important to note, however that until 1910, when Dr Mitchell's education code was adopted, non-caste Hindus were not admitted to government schools as they were treated as untouchable

TABLE 2: DISTRIBUTION OF CHRISTIAN-RUN SCHOOLS, 1908

Denomination	No of Schools
London Missionary society	393
Church Missionary society (Travancore-Cochin diocese)	296
Church of England Zenana Mission	16

nd unapproachable. The new code abolished the differences between ordinary schools and schools for the backward classes as laid down in the government's order of 1904 [Pillai 1940:718-19].

Our survey of educational developments in Travancore has conclusively shown that for most of the 19th century the state played a very minimal role with regard to major issues relating to the modernisation of school education or the promotion of female education and the education of backward sections. Whatever little success the state had achieved in these spheres during the 19th century was almost entirely due to the efforts of Protestant missionaries and the indigenous churches. The relative positions of the more numerous castes and communities with regard to literacy at the beginning of the 20th century is presented in Table 4.

It can readily be seen that throughout the 19th century literacy in Travancore remained low mainly because (1) educational facilities were denied to the backward classes, including the 'untouchables'; (2) female education in general was neglected; and (3) the backward and depressed communities were so numerous that missionary and indigenous church efforts were not able to make a significant dent in their educational status. The literacy levels of five major backward and depressed communities, namely, ezhava, channan, pulaya, pariah and kurava, which together constituted one-third of the state's population in 1901, were deplorably low and posed a major obstacle to the progress of overall literacy in the state. It was chiefly left to two major social movements, one headed by Sree Narayana Guru (1855-1928), an ezhava 'sanyasi', and the other by Sri Ayyan Kali (1863-1941), a pulaya social reformer, to correct this imbalance.

SNDP YOGAM

Referring to the progress by the ezhavas, the writer has observed that there has been no parallel anywhere in the world to the tremendous progress made by the community in so short a time. A community which had been confined to the 'gutter of untouchability' put up a heroic fight more valiant than that of the plebeians of ancient Rome for securing basic human rights and produced many distinguished personalities within just 30 years [Rajendran 1974:2].

At the beginning of the 20th century, as already noted, 927 out of every 1,000 ezhavas in Travancore were illiterate. Admission to government schools was denied to ezhavas on the ground of untouchability. Even after the legal removal of that impediment there were instances

of teachers and students belonging to upper castes boycotting classes because of the 'polluting' presence of ezhava students. Further, even if they were educated (in missionary schools in Kerala and elsewhere), employment opportunities were hard to come by: ezhavas were not recruited to government service. In 1891 there was not even one member of the community holding sarkar job on a monthly salary of Rs 10 or more [Jeffrey 1976:109].

Palpu (1863-1950), a founder of the Sree Narayana Dharma Paripalana (SNDP) Yogam, who had completed his medical education (LMS) in Madras, was not granted recognition by the Travancore Medical Council, and had to seek employment outside the state. He championed the cause of the ezhava community at all available fora. During a meeting in 1896, the dewan of Travancore submitted to Palpu that admitting ezhavas to schools and appointing them in government service would be 'contrary to tradition'. However, he held out the assurance that special schools would be granted to ezhavas provided they took the initiative. Though a large number of applications were filed, however, only two primary schools got the go-ahead.

In reply to a subsequent memorial to the maharaja of Travancore signed by 13,176 ezhavas, the dewan promised that special schools could be granted to ezhavas wherever they wanted. He also agreed to consider the possibility of opening separate government schools for ezhavas and other similar castes on a caste-by-caste basis. Since these assurances produced no results, Palpu took the initiative to form an effective organisation. The SNDP Yogam was formed in May 1903 with Sree Narayana Guru, the great social reformer, as the patron.

The first attempt of the organisation was to remove the obstacles to the admission

of ezhavas to government and government-aided schools. The move was opposed by caste Hindus and this led to widespread riots between nairs and ezhavas in central Travancore. In 1907 an order was issued stipulating that ezhava children could be denied admission to a government school only if the school was close to a temple or a palace or if there was the possibility of a riot. It was only in 1910 that government schools were declared open to ezhava children. Even then, however, admission was confined to only 35 government schools [Abhimanyu 1990:85].

Later the Yogam concentrated on establishing its own schools. Narayana Guru's motto was "Strengthen through organisation, liberate by education". It proved

TABLE 5: GROWTH OF EZHAVA LITERACY IN TRAVANCORE

Year	Percentage of Literates to the Population of the Community		
	Male	Female	Persons
1875	3.15	0.05	1.57
1881	12.10	NA	6.30

to be a great inspiration to the entire community. The SNDP Yogam was formally extended to Cochin in 1938 and to Malabar in 1946. At present it has 13 high schools, eight upper primary schools and three lower primary schools.

As more and more civic liberties were being wrested from the government by the ezhavas, the community was making greater and greater progress in literacy. It needs to be emphasised that the significant progress in literacy it achieved during the period was the outcome not so much of the increase in the number of schools run by the SNDP Yogam as of the community's unfettered access to government schools since the passing of Mitchell's education code in 1910 (Table 5).

While both male and female literacy in the ezhava community made rapid progress before Independence, the rate of growth since 1901 was much higher in respect of female literacy. While male literacy (ratio of male literates to the male population) rose from 13.71 to 61 per cent between 1901 and 1941, female literacy increased from 0.98 to 32.2 per cent.

SADHU JANA PARIPALANA SANGHOM

Next to the ezhavas, the pulaya community has been the largest of the backward and depressed classes. Traditionally pulayas formed the dominant slave class in Travancore along with the pariahs and the kuravas. As noted earlier, throughout the 19th century literacy rates in Travancore remained low in absolute terms because large communities like the ezhavas and the pulayas were denied the right to education. While the SNDP Yogam worked mainly for the uplift of the ezhava community, similar movements sprang up among other disadvantaged classes also. Sadhu Jana Paripalana (SJP) Sanghom, established at Vengannur in south Travancore by Ayyan Kali in February 1907, was one of them.

The formation of this organisation was assisted by advice and support from leaders of the SNDP Yogam, which had been formed only a few years earlier [Abhimanyu 1990:79]. During the dewanship of P Rajagopalachari (1909-1914), Ayyan Kali submitted a petition for admitting pulaya children to government schools. On being informed by the dewan that a decision favourable to the depressed classes had already been taken in 1907, he approached the government school authorities and pressed his demands.

Ayyan Kali made a public announcement to the effect that unless pulaya children were admitted in government schools, pulaya labourers would not work in the

paddy fields. The announcement led to conflicts between the landlords (caste Hindus) and pulaya agricultural workers. An 'Ayyan Kali army' was formed to foil the attempt of the landlords to cultivate lands with the help of loyal pulaya workers. There was much turmoil for a year; a compromise was, however, reached soon. On March 1, 1910 the government issued an order according to which all schools to which ezhava children were admitted should also accept pulaya children [Abhimanyu 1990:91].

In a speech in March 1912 in the Sri Mulam Praja Sabha, to which he had been nominated, Ayyan Kali drew the attention of the legislature to the fact that pulayas were admitted to only seven government schools in south Travancore because of resistance from headmasters belonging to upper castes. His insistence on pulaya children being admitted to all government schools led to many clashes. In 1914 Mitchell, the director of public instruction, issued an order which made the admission of pulaya children to government schools mandatory.

The caste Hindus then hit upon a new strategy. The moment depressed caste/community children entered a classroom upper caste children would leave the room *en bloc*. Hence Mitchell issued an order which stipulated that children who continuously absented themselves from class should submit an explanation of their absence to the headmaster and apply for exemption. If the children failed to do so they were to be given compulsory transfer certificates. In spite of this order, violent clashes between the pro- and anti-pulaya groups took place in many places like Ooruttampalam (Neyyattinkara) and Pullad.

In 1914 Ayyan Kali himself started a school at Vengannur. Interestingly, a caste Hindu teacher who was offered a monthly salary Rs 9 (instead of the normal Rs 5) was appointed to the post.

The Temple Entry Proclamation of November 1936 and Gandhiji's active involvement in the uplift of harijans (dalits) on an all-India basis helped the pulayas gradually to get integrated with the mainstream. Gandhiji himself undertook a pilgrimage to temples in Kerala in January 1937; during this mission he visited Ayyan Kali at Vengannur. In due course the initial barriers, which appeared to be insurmountable, were overcome. Literacy among the pulayas as well as other depressed classes advanced rapidly (Table 6).

The series of agitations led by the SJP Sanghom produced spectacular results before Independence, as evidenced by the fact that at the end of the school year 1929-30, only 12 of the 3,641 recognised schools in Travancore kept pulayas and other similarly placed groups out [Travancore Census Report 1931:435]. In a single decade (1931-1941) the pulaya community's literacy level rose by 13 percentage points. Though female literacy lagged behind male literacy, it grew at a much faster rate. It cannot be overemphasised that it was radical social transformation of the ezhavas and the pulayas which contributed to the rise in literacy in Travancore from 12.36 per cent in 1901 to 42.1 per cent in 1941.

Inspired by the contributions of the SNDP Yogam and the SJP Sanghom to the uplift of the ezhava and pulaya communities respectively, several other organisations came to be started in Travancore.¹¹ These organisations concentrated their activities in different parts of the state and

TABLE 7: TRENDS IN LITERACY RATES IN KERALA, 1961-91

District	1961			1971			1981			1991

for the benefit of different communities. Their broad thrust was the same as that of the other educational agencies, and over a period of time these organisations reinforced the efforts to educate the major backward and depressed communities.

SPURT AFTER INDEPENDENCE

After independence the princely states of Travancore and Cochin were integrated to form the Travancore-Cochin state on July 1, 1949. The present state of Kerala was born on November 1, 1956 as a result of the reorganisation of Indian states along linguistic lines. The Tamil majority taluks of Travancore-Cochin were lost to Tamil Nadu and the Malayalam-speaking Malabar region was added to Travancore-Cochin to form the new state. The formation of Kerala brought about two major changes in the socio-political scenario: (1) the emergence of the Communist Party of India as a strong rival to the Indian National Congress, which had held sway over Travancore-Cochin; and (2) the rise of the Muslim community (and their political organisation, the Muslim League) as a major player.

In course of time coalition governments formed by either the United Democratic Front or the Left Democratic Front became the rule rather than the exception in Kerala. Since both fronts have been of roughly equal strength, each has been pursuing policies which would ensure the greatest possible support from every region and community. This 'balancing act' has resulted in rapid progress of literacy in districts such as Kasaragod, Kannur, Palghat, Malappuram and Wayanad, which were far behind the state average when Kerala was born. The districtwise progress of literacy in Kerala is summarised in Table 7. Note that a rapid advance in female literacy has been the main factor contributing to substantial progress in general literacy wherever it was achieved.

On April 18, 1991 Kerala was declared a totally literate state on the basis of the norms accepted by the National Literacy Mission. The effective literacy rate – the number of literate people in the population divided by total population less population in the 0-6 age group – of Kerala, according to the 1991 Census, stood at about 90 per cent (nearly 94 per cent for males and around 86 per cent for females).

CONCLUSION

The impression is often sought to be created by writings on Kerala that the high level of literacy as well as the other

social-sector developments (of the 'Kerala model') achieved by the state is the outcome mainly of the vigorous pursuit of enlightened and progressive policies by the state. Our analysis shows, however, that the state was only one of the players – and a relatively passive one – in the transformation of Kerala into the most literate state in the nation. Compared to the rapid strides made during the 20th century, throughout the 19th century literacy rates in Travancore (and Cochin) – which spearheaded the process of educational development during the British days – remained low because the state denied large sections of the population like the ezhavas and the pulayas education on caste grounds. Although the literacy levels of the caste Hindus were slightly higher than those of the depressed castes during that century, the general literacy level of the state as a whole remained low because of the widespread illiteracy of the high-population backward and depressed classes.

It must shock the admirers of the Kerala model of development to learn that throughout the 19th century the state did very little to promote female education or the education of the downtrodden. Whatever progress was achieved in these fields was due to the efforts of the Protestant missionaries and the indigenous church. The missionaries came to the Malabar coast not at the initiative of the state but as a result of the determined efforts of the British Residents.

While the rulers of the states extended many favours to the missionaries, mainly at the instance of the Residents, the missionaries often faced the hostility of the caste Hindus and the bureaucracy, presided over by dewans (mostly brahmin or foreign) and staffed by caste Hindus. The entry of the indigenous church into educational activities – during the latter part of the 19th century – owes much to the grant-in-aid schemes of the government.

During the first half of the present century the educational efforts of the foreign missionaries and the indigenous churches in Travancore were reinforced by several powerful social movements, among which the SNDP Yogam and the SJP Sanghom, representing the ezhavas and the pulayas respectively, were the most prominent. The organised might of these movements eventually made the government agree to throw its schools open to members of the backward and depressed communities. Once this objective was achieved the

literacy levels of those communities rose rapidly.

The formation of the Kerala state in 1956 resulted in the educational uplift of the backward regions of Malabar (of the erstwhile Madras state), thanks to a patriotic fervour in favour of a united Kerala, political compulsions and an unprecedented expansion of literacy in all parts of the state and among all sections of the population.

Notes

[The author expresses gratitude to PR Gopinathan Nair for his valuable comments.]

- 1 The powerful Nair Service Society (NSS), formed in 1914 by Mannath Padmanabhan, was an altogether different kind of movement. As literacy among the Nairs was among the highest in the state, the NSS focused on the eradication of superstitious beliefs and social evils, besides working for the economic advancement of the community.
- 2 Custom prescribed that a Nair may approach but not touch a Brahmin and that a Shanar or Ezhava must remain 36 paces away and a Pulaya slave 96 paces away. Similar distances were appointed for other castes and between different castes.
- 3 The rights and privileges granted to the Syrian Christians during the early centuries were inscribed on copper plates. Such plates are believed to have been executed by rulers like Cheraman Perumal (fourth century), Ayyan Atikal Thiruvattikal of Venad (ninth century) and Vira Raghava of Mahodayapuram.
- 4 Samuel Mateer, a prominent London Missionary Society man who spent nine years in Travancore, has said that Europeans were forbidden to use the main road and were required to traverse a path along the coast where Brahmins rarely travelled. He himself had been ordered off a public road by servants of a Brahmin priest who was passing along in his palanquin. Mateer refused to oblige. Other missionaries had been assaulted for non-compliance [Mateer 1870:32-33].
- 5 Colin Macaulay was the brother of Zachary Macaulay, one of the founders of the Church Missionary Society in England. No wonder he had concern for the uplift of the Syrian Christians of Malabar.
- 6 Mead retired from his new assignment in 1871 and his end came on January 19, 1873. During his 57 years' residence in India (1816-1873), Mead had contributed a lot to the spiritual and material progress of the underprivileged people of southern Travancore.
- 7 The Baker Memorial Girls' High School, which became a full-fledged English high school in 1903, has grown out of the merger and consolidation of the earliest girls' schools started in Kottayam by the wives of Bailey, Fenn and Henry Baker (Sr).
- 8 The grant-in-aid code stipulated the following conditions: (a) The course of instruction provided should be the same as that obtained

in government schools, (b) The prescribed textbooks should be the same, and (c) only properly qualified teachers should be employed

- 9 The curriculum of a pyal school consisted of some lessons in arithmetic, astronomy, neethi-saram, the thousand names of Vishnu, a portion of the Sanskrit dictionary, easy lessons in casting horoscopes and the calendar, a few verses on medicine and general poetry, all written on palmyra leaf [Aiya 1906:453-54]
- 10 Declared backward for the purpose were the pulaya, pariah, vedan, izhawa, shanar, kurava, vettaran, marakkan, paravan, mukkuva, velan, pullan, malayarayan, talavan, tandan, mutuvan, velutedan, maran and kshaurakan castes, as well as the Mahomedan community [Aiya 1906:482].
- 11 Among such organisations, we may list the following
 - 1 Prathyksha Reksha Darva Sabha (for the benefit of pulayas and pariahs turned Christians) 1909
 - 2 Central Travancore Pulaya Samajam.
 - 3 The Cheramar Mahajana Sanghom (for the uplift of pulaya converts to Christianity) 1919
 - 4 The South Travancore Samhavar Mahajana Sanghom (organisation of pariahs) 1919
 - 5 The South Travancore Aiyavavar Samajam (organisation of ayanavar community) 1916

- 6 The South Travancore Chackalavar Samajam.
- 7 The South Travancore Keralamuthali Samajam
- 8 The Kerala Adimajana Sabha (for the common good of kuravas, pulayas, pariahs and vedas)
- 9 The All-Kerala Araya Mahajana Yogam.
- 10 The All-Travancore Varnavar Samajam.
- 11 The Yogiswara Mahajana Sanghom.
- 12 The Travancore Virasaiva Samajam.
- 13 The Keraliya Panar Samajam.
- 14 The Lajna Mohammadiya Sabha.

Towards a New Financial Architecture

The frequency and intensity of financial crises in recent years is matched only by the plethora of competing explanations of their underlying causes. There is disagreement too on how economies and markets, once sucked into the vortex of such crises, should extricate themselves from the resulting turbulence. There have also been suggestions more recently on how such crises could be better prevented, including through a radical redesign of the standards, rules and governance structures that influence international financial flows. A rapid guided tour through this rough and sometimes inconsistent terrain with the focus on the implications for a new international financial architecture. **2859**

Village India: Studies and Re-studies

Replication studies are not a feasible way to proceed in ethnography, so anthropologists do the next best thing, the village re-study. A 27-year study of four Badaga villages, representing different phratries and social strata in the Nilgiri Hills in Tamil Nadu, illuminates the process of modernisation of a traditionally peasant millet-farming community **2867**

VAT for a Federal Economy

Experience gained in several federal economies, both developed and developing, has established the undesirability of subjecting commodity taxation to two levels, the federal and the provincial. Analysis of the efforts over the last 15 years to introduce a VAT system in India in place of union excise duties and state sales taxes with a view to offering an alternative, more appropriate, VAT model. **2875**

Dealing with Financial Crimes

No country can lay claim to a modern and world class financial system without knowing how to handle financial crimes and scandals. This calls for building up confidence in the regulatory process through swift detection of irregularities and deterrent punishment within a meaningful time-frame. Harshad Mehta's conviction this week in a case relating to the Securities Scam of 1992 has underscored how far we are from these goals. **2833**

Understanding Globalisation

The implications of globalisation for national and international policies are far-reaching and we need to refine our understanding of them by taking stock of the developments on the ground as also in the thinking about them **2845**

Agrarian Capitalism

Agrarian capitalism is conceived too narrowly in the literature on India, on models which are simply unrealistic when applied to the social and ecological circumstances of this part of the world. A review article. **2850**

East Timor and Kashmir

When ideology and realpolitik come in conflict, ideology has to take a back seat. As the hour struck for the resolution on the referendum on East Timor's independence to be voted on in the UN General Assembly, India was a non-enthusiastic joiner-in. For realpolitik read Kashmir. **2832**

Smooth Sailing

With the opposition votes split, Mahathir Mohamad's 13-party coalition will sail through the forthcoming general elections in Malaysia, the recent political hiccups notwithstanding. **2844**

Irrigation Management

The legislation enacted in Andhra in 1997 to enable the participation of farmers in the maintenance of irrigation systems has led to many worthwhile initiatives, but the reforms now need to be carried forward to cover the critical realm of end-use regulation of water. **2834**

EC's Priorities

In the light of some of its recent actions, there is a strong case for a dispassionate review of the Election Commission's role in the electoral process. **2838**

Trade Union Data

The trade union data published by the labour bureau of the union government are anything but reliable, resulting in question-marks, for example, over whether or not there has been a secular decline in the degree of unionisation. **2839**

Asia's Women Leaders

While dynastic charisma is a factor in the rise of many women political leaders in Asia, in the case of Soma Gandhi it is being cleverly articulated to her advantage in India's current political vacuum. **2842**

Unemployment in Kerala

K P KANNAN'S paper 'Political Economy of Labour and Development in Kerala' (*EPW*, December 26, 1998) is an excellent portrayal of the dilemmas facing Kerala economy at the present juncture. While trade unions have been successful in improving wage rates in Kerala, they have been much less successful in tackling unemployment.

The writings on Kerala economy during the past two decades or more have largely emphasised the positive side of the Kerala development model, particularly the high level of social development and its consequences. The darker side of Kerala's development experience characterised by a high level of unemployment in the state has until recently been largely ignored in the literature. My own attempts to draw attention to the problem of unemployment in Kerala (*Economic Development and Unemployment: Relevance of the Kerala Model*, Asian Publication Services, New Delhi, 1983 and *Socio-Economic Change and Regional Development*, Deep and Deep Publications, New Delhi, 1991) went largely unnoticed in academic circles. With the publication of K P Kannan's paper and E T Mathew's book (*Employment and Unemployment in Kerala*, Sage Publications, New Delhi) it can now be expected that serious attempt will be made by the state government and all others concerned to tackle the most serious of all problems confronting Kerala economy today – unemployment.

The problem of unemployment is serious since it tends to almost nullify other positive aspects of the Kerala development model. Whatever may be the gains enjoyed by the working class in the state, it cannot be ignored that a large segment of the job aspirants in Kerala are forced to migrate outside the state in search of employment where they have to toil under harsh conditions without enjoying a great deal of the privileges which the labour force in Kerala takes for granted. Migrants from Kerala are living under very difficult conditions not only in the Gulf countries but also in many parts of India. Of what benefit is it to these Keralites that their state has evolved as a paradise of social development when they cannot enjoy living in this paradise but have to migrate to other parts

of the country and abroad in search of employment.

Another factor that has to be taken note of is the fact that the edge that the state of Kerala today enjoys over other parts of the country in social development may not be sustained for very long for the following two reasons:

One, the financial health of the state government is not good enough to permit it to maintain a high level of per capita expenditure in the social sectors in the future. Ultimately, if state government finances are to improve to permit it to maintain high levels of expenditure in social services, it will be possible only if there is a sustained growth in output in the agricultural and industrial sectors of the economy.

Two, the advantage enjoyed by the state of Kerala in educational development is basically restricted to the primary education segment and also school education as a whole. In the matter of achieving universal literacy the other states of India will catch up with Kerala within another two decades or so. Beyond that period the educational achievement of states in India is going to be determined by the level of higher educational facilities in the region. In the matter of providing higher education facilities, Kerala is already lagging behind many other states in India. Tamil Nadu, for instance, has made rapid strides in the field of higher education

such as by implementing the scheme of providing autonomy to colleges and other important measures like improving facilities for professional and vocational education in the state.

Thus the requirement in a state like Kerala is not to look back and take comfort about its achievements in the past but to look forward to the future and work out a policy framework which enables sustained development in the social sectors so that the comparative advantage enjoyed by the state in development activities in this sector is maintained and carried forward. Otherwise the state is likely to slip behind even in the matter of educational development (see P V Rajcey, *Planning For Social Reforms*, Deep and Deep Publications, New Delhi, 1999).

In the past educationally qualified migrants from Kerala could easily find employment in metropolitan cities in India. Today with educational progress in other parts of the country, job-seekers from Kerala are facing increased competition. With dwindling job opportunities outside the state there is all the more reason why the state government should introduce appropriate reforms in its policies and programmes to ensure adequate employment opportunities for the younger generation.

Bolting Some Doors

OVER the past decade the nature and structure of health care has been undergoing a great deal of change. With the gradual, though imperceptible, withdrawal of state funding in health care, the expansion of the private sector has become more evident. The growth of health care corporations, tacitly encouraged by the state, has gained momentum. Even as medicare institutions have become 'modernised', personnel have also become more mobile, between urban areas as well as across borders with outmigration of nursing and medical staff becoming more diffused. Simultaneously, the polarisation of health care services in terms of whom they serve has sharpened. In sum the market for health care is becoming better defined with market mechanisms operating across the sectors. While cost of health care has risen sharply for all users, some regulation of the market has become more feasible. This is particularly true in the context of globalisation with health services becoming a well-defined item in WTO negotiations on trade in services. A document currently under discussion of a 10-member group constituted by the union ministry of health and family welfare and to be tabled at the WTO meeting in January has put together proposals for opening the health sector to international trade.

Undoubtedly, the notion of 'opening to foreign trade' an area which has always been considered a component of the welfare commitment of the state and which is, in the main, in a state of grave disrepair and neglect should prompt some criticism and cautions. But equally it is pertinent to acknowledge that such a document is after all formalisation of a process which was set in motion several years ago. The main considerations of the document focus on India's ability to export hospitals and diagnostic clinics and to provide services for patients from all over the world and to 'export' such services/institutions as 'turn key' projects to countries of West Asia and Africa.

The growth and expansion of the corporate sector and its attempts to evolve closer links with the international medicare institutions has been evident from a long time, as early as the first decades after independence. Today international linkages are being sought in many different ways – through research projects; collaborative care, or more directly the selling of Indian medicare facilities abroad, especially in West Asian countries. And it is here that the international certification being so proudly displayed by several corporate hospitals and allied institutions becomes useful. These are after all, necessary accoutrements in a consumer-controlled market, which does not exist in India for medicare and related products. The Indian consumer of health care is hardly likely to be in a position to exercise a choice in purchasing medicare. The market for sophisticated high cost medical care in India is small and cannot be expected to grow significantly enough for the high investments being made on these projects to make

commercial sense. Thus the only reason for this recent and sharp growth in this area is its potential to access foreign markets – to attract foreign patients and to provide a base and infrastructure for replicating such models in other countries, particularly in West Asia and Africa. The continuing expansion of medical personnel, with new high-fee medical colleges emerging every academic year, is led by these perceptions of future growth. If it is to be ensured that some of this expansion of services and its growing sophistication is accessible to people within the country, then it is imperative that some regulations are introduced in the medicare market. How feasible is this for a state apparently in retreat? And if feasible, is the state the most appropriate agency for monitoring and regulating these institutions?

Significantly, in most developed countries, the US, Canada and Britain of course, the state plays a vital and emphatic role in regulating the medicare industry. It is this that has made quality medicare accessible, though not as easily as necessary, to those in the lower economic strata even in the context of spiralling medicare costs. In India, to begin with the state excluded in its planning process the private health care sector. This neglect has produced a scenario, now much written about, of a huge and largely unregulated private sector and a small, inefficient and insufficiently funded public sector in health care. Such has been the blind spot that most states have either never passed legislation separately governing medicare institutions, or have not hitherto framed rules to apply the law. Over the last few years persistent effort by the health movement and medical forums has prompted some movement on self-regulation. Not surprisingly, this has received impetus from the growing global links that the medical profession and institutions are developing. Both research and care institutions are increasingly collaborating with foreign institutions and often receive project funds which in turn demand certain standards and minimum requirements of infrastructure as well as qualifications and training of personnel. The recent renewed attempts to rejuvenate the Indian Medical Council are to be seen in this context.

Clearly and inevitably, the medicare industry will become formally linked to the growing international trade in services. Having acknowledged this it is imperative that the ministerial body now considering the draft document to be presented at the WTO negotiations give careful thought to ensuring that a vital service like good, state-of-the-art medicare remains accessible to those who need it within the country. There is no room for exclusive export-oriented growth in this area. But this will not be easy to ensure without stumbling over WTO requirements. And this is why it is imperative that the ministry urgently make public the draft proposals and facilitate wide-ranging debate among the providers as well as the consumers of medicare.

Disgraceful Legacy

A TEENAGE, illiterate, tribal girl from Bihar is taken to Paris by one of our diplomats working in the Indian embassy there. While French medical experts who examined the girl, after she ran away from the Indian diplomat's house and was rescued by a French anti-slavery NGO, place her age at 17, her passport shows her age as 19. She ran away from her employer alleging that not only was she overworked and underpaid, but also that she was badly treated. According to the French medical report she was found to have been "recently sexually mutilated".

Ever since this story of the girl made the headlines in the French media, the Indian embassy in Paris has been busy not only denying the allegations but also going a step further and blaming the girl for shirking work and for having run away from her employer's house to escape deportation. It is also reported that pressure is being brought to bear upon the girl's family in Bihar through influential persons not only to get the unfortunate girl repatriated to India at the earliest but also to make it appear that she is of unstable mind and doubtful character'.

The whole episode reflects poorly on the practice of the Indian foreign office, inherited from the colonial times, of allowing diplomats to take live-in domestic servants with them when they are posted abroad. This outdated practice ought to have been discarded right at the outset. What is unforgivable is that even women are allowed to be taken abroad as live-in domestic servants of Indian diplomats. In this particular case, an illiterate tribal girl whose age appears to have been deliberately overstated in her passport was taken to Paris and then treated so badly that she was driven to run away from the employer's house and attempt to commit suicide.

Not that similar stories have not surfaced from time to time in the past. But every time the attempt on the part of the Indian foreign office has been to somehow put a gloss on things in a manner that the episode is forgotten at the earliest and no action is taken either to get at the root of the incident or to put a stop to this disgraceful practice of Indian diplomats being allowed to keep live-in domestic servants, including women, when they are posted abroad.

Stories of maltreatment of Indian women migrating to the Gulf and other parts of the world and taking up jobs as

domestic servants are not uncommon. It is estimated that the number of women from India working overseas in domestic jobs could be quite large and may exceed one lakh. From time to time, several of our women workers abroad have had to seek the protection of Indian diplomatic offices. It is also not uncommon to come across stories of indifference shown by our diplomats towards such complainants. The episode in Paris clearly brings out what could possibly lie behind such indifference.

If our diplomats themselves are used to treating their own live-in maids so badly, how can one expect them to have any sympathy for the victims of similar maltreatment by others? What is called for immediately is that the practice of allowing live-in women domestic servants to our Indian diplomats posted abroad is stopped.

TERRORISM

Chicken Come Home to Roost

THE latest session of the UN General Assembly which was supposed to move towards a new global consensus on cross-border terrorism, turned out to be yet another exercise in duplicity and expediency, where our foreign minister Jaswant Singh matched US president Clinton in sanctimonious rhetoric.

Both raised the spectre of cross-border terrorism as the gravest danger facing the world community. Clinton urged nations to wake up to meet the challenge posed by terrorism, and appropriated for his government the monopoly role of protecting them - to the extent of suggesting that it should bypass the UN and launch military actions in other countries to fight terrorism. Jaswant Singh echoed similar sentiments by describing terrorism as the great 'global menace'.

But the Indian foreign minister added a new dimension. He embellished his pontification by alluding to the "scimitar of nareo-terrorism that cut across the Caucasus to the south Asian subcontinent", his speech being mainly directed against Pak-sponsored terrorism in Indian territory. Singh's choice of the word 'scimitar' is significant. It was used by the English to describe the curved sword of the Muslims who fought the Christian Crusaders in the middle ages. Singh deliberately used the word to revive among his western listeners memories of their wars against scimitar-wielding Muslims. Singh sought to iden-

tify global terrorism with Islamic fundamentalism and tried to appeal to the anti-Islamic Christian sentiments of the past which are being reinforced today in the west by the killings and bombings indulged in by Islamic terrorists not only in the US and Europe, but also in Russia.

There are however two snags in Jaswant Singh's presentation at the UN General Assembly. First, terrorism in the present global context is not solely an Islamic fundamentalist monopoly. There are powerful terrorist groups spread in different parts of the world, who are inspired by various motivations, like the Jewish Zionists in Israel, the anti-semitic neo-Nazis in Germany and other parts of Europe, the white racists in the US - as well as political organisations of nationalities seeking self-determination which resort to terrorist tactics, like the Palestinians or the IRA in Ireland. Secondly, Singh glossed over the phenomenon of the rise of terrorism within India. If terrorism is to be attributed to the 'scimitar' of Islamic fundamentalism, how can he explain the continuing terrorist acts of the Hindu high-caste dominated ULFA in Assam, or the tribal secessionist groups in the north-east, or the Khalistani groups among the Sikhs? It is all very easy for the Indian government to blame Pakistan's ISI for recruiting these terrorist groups in India. But, even if we believe in its allegation, the question remains - why have these non-Muslim separatist groups agreed to be funded and armed by Islamic fundamentalist forces? Clearly, it is not a religious issue, but a problem that cuts across religious or state boundaries, where certain leaders of nationalities determined to carve out their own nation states are willing to take help from any source, irrespective of its religious, ideological or moral character. Thus, we found in the past how Christian Naga insurgents sought military aid from the communist government of China, despite the fact that their Chinese co-religionists were at that time complaining about curbs on their religious activities by Beijing. In recent times, the Sikh militants of the Khalistani movement managed to overcome their community's collective memories of their wars against the Moghuls and the bloodbath of the Partition, in order to receive military training from the ISI in the Islamic state of Pakistan. Of late, if we are to believe the union home ministry's intelligence reports, the ISI has succeeded in attracting the ULFA cadres of Assam who are believed to be receiving training from Pakistani army personnel in camps in Bhutan. Yet, the present leaders of the

same ULFA (when they were members of the All Assam Students' Union) allegedly played a major role in the massacre of thousands of Muslims in Nellie in February 1983 during the assembly elections in the state. Both the patron and its protegee, the Islamic state of Pakistan and the Hindu upper caste dominated ULFA, are apparently prepared to forget the past as long as it suits their respective interests – the former looking for any opportunity to needle India, and the latter hoping to make use of Pakistan's anti-India stance to attain its objective of carving out an independent Assam.

All this skulduggery in relations between the various terrorist groups and their patrons is not confined to the Indo-Pak subcontinent, but can be found all over the world – whether their patrons or trainers are intelligence agencies of states, multinational organisations of mercenaries, international cartels of arms manufacturers, or drug-traffickers who enjoy state protection. But while ritualistically condemning cross-border terrorism, the UN General Assembly quite conveniently ignored these sources that sustain global terrorism.

It is significant that both Clinton and Jaswant Singh shrugged off the past roles of their respective governments in sowing the seeds of what has today assumed the menacing form of a global threat. It was Washington which armed Iraq's Saddam Hussein to fight Iran, backed the Serbian leader Slobodan Milosevic when he massacred thousands in Bosnia, trained Osama bin Laden and the Afghan mujahideens to battle the Russians. Today the chicken have come home to roost. Washington's erstwhile proteges are not only engaged in ethnic cleansing in their own countries, but are also striking back at the US itself. Successive governments in India also had followed a similar policy of aiding or arming certain individuals and groups for immediate gains, who later developed into terrorists posing a threat to the state and the people. One can recall in this connection how Indira Gandhi propped up Bhindranwala against her opponents in Punjab, how the RAW trained the LTTE militants, how even today the government continues to play with fire by arming surrendered militants in Kashmir and Assam who are becoming a new terrorist menace.

Cross-border terrorism is a Frankenstein in the creation of which almost all the states over the last few decades have contributed in some measure or other – whether it is the self-appointed international cop US, or the emaciated but

megalomaniac state of India and the militarily ambitious state of Pakistan in the subcontinent, or whether they are the various states in Africa caught up in tribal conflicts which spill over their borders.

EAST TIMOR

Mishandling by UN

EAST TIMOR's resolve to be an independent country has a long history. Its articulation through the UN-conducted referendum of August 30 only signifies that its demand, muffled for decades, has gained sudden legitimacy and an urgency in the corridors of the western powers, who till the other day were engaged in depriving East Timor of the freedom due to it way back in 1975. The most agonising part of this unfolding political drama in south-east Asia is that these powers were indifferent to the sufferings of the East Timorese under the colonial yoke of Portugal and, after the departure of the Portuguese, to avert the threat of a communist takeover and for unfettered access to the oil reserves and mining rights in the archipelago encouraged the appropriation of East Timor by Indonesia, turning a blind eye to the brutalities heaped by the Suharto regime on the East Timorese for more than two decades. Now a 7,000 strong UN peace-keeping force has been hastily constituted to uphold East Timor's right to self-determination against Indonesia-backed, rampaging pro-integrationist militia.

Sadly, the UN too deemed an armed intervention in East Timor necessary only in the post-referendum period, when it was known that the scale of violence unleashed by the pro-integrationist militia, uprooting lakhs and killing hundreds of East Timorese, had been going on for more than six months. The havoc wreaked by the militia on East Timor civilians gained momentum once the Indonesian caretaker president B J Habibie, without

consulting parliament or the powerful military, announced in early May the referendum for autonomy of East Timor in a bid to distance himself from the defamed legacy of his predecessor and to turn the pro-democracy tide amongst the Indonesian voters in his favour for the elections to the house of representatives to be held in June. It is clear from the turn of the events that East Timor had become a pawn in the jostling for presidential power in Indonesia. With the East Timorese providing a low turnout during the June elections, the pro-integrationist militia, spurred by the slighted Indonesian army, indulged in further mayhem to intimidate the East Timorese. In the light of this preceding bloodshed and terror, a referendum verdict against autonomy was bound to set East Timor aflame again.

With thousands massacred, and lakhs displaced as internal refugees and another lakh forcibly evicted to West Timor, the UN's wisdom in conducting the referendum exercise against this violent backdrop is open question. Though Habibie, making his own political calculations, may have given a green signal to the referendum, was it not the UN's responsibility to assess whether the conditions in East Timor were conducive for a referendum, and accordingly should have taken precautionary measures, especially when an unarmed civilian populace was to cast its vote in all probability against the might of an armed nation state? Moreover, with Indonesia itself in the process of setting its house in order, it would not have been a dereliction of duty on the part of the UN to bide time for the referendum, given that the UN otherwise had remained a silent spectator over the years of the atrocities perpetrated against the East Timorese. Had the UN taken steps, taking into account that East Timor, though firm in its resolve to be independent, has yet to gain control over its destiny, at least the magnitude of the tragedy could have been mitigated.

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the *EPW* from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

MANAGER

CURRENT STATISTICS

EPW Research Foundation

With some moderation in banks' deposit growth followed by a pick up in advances and commercial investments, the excess liquidity in the system has begun to evaporate. As a result, the RBI is hard put to it to avoid pressure on primary yields of treasury bills and dated securities. The secondary market yields on the gilt-edged as well as commercial bonds have already firmed up. Despite 75 per cent of gross market borrowings already done, budgetary compulsions may induce further sizeable borrowings in the months ahead.

ASIAN PAINTS

Expanded Capacity

ASIAN PAINTS, which has a strong presence in the decorative paints segment, notched a 11.5 per cent increase in net sales in 1998-99. However, a sharp increase in operating expenses resulted in operating profit rising by a mere 2.3 per cent. The main culprit was the sharp rise in costs of raw material such as titanium dioxide and vegetable oils and firm prices in other materials during the first nine months of the year. Titanium dioxide accounts for 30-35 per cent of the company's total raw material imports. Also, lower realisation from phthalic anhydride and pentaerythritol, due to sluggish international prices, had an adverse effect on the company's margins.

The company managed to stem this downward trend by sharply reining in its interest costs (up only 1.9 per cent) through a tight grip over its working capital position. A lower tax provision also provided some relief. Consequently, net profit rose by 18.3 per cent. Encouraged by its balancing act, the company decided to raise the dividend rate from 75 per cent to 80 per cent during the year under review. With earnings per share rising from Rs 16.8 to Rs 19.8, the company's stock price recently touched Rs 400 on the bourses.

The market for decorative paints remained subdued during the year, growing by around 7 per cent, and was adversely affected by a short Diwali season and the extended rains during the year.

A major part of the capacity expansion at the company's Kasma plant was completed and the paints block started production in September 1998, while distemper production began in November. The capacity expansion at the Patancheru plant and the reconstruction of the paints block at the company's plant in Mumbai were also completed during the year. The company's capacity increased by about 37 per cent to 1.63 lakh tonnes.

Asian Paints was in the news last year when British multinational ICI plc attempted to acquire a 9.1 per cent stake in the company. However, the promoters of Asian Paints refused to transfer the shares. Also, when the Indian government decided to close ICI's application

for approval to buy the stake, ICI plc decided to cut its losses by selling off 4.55 per cent of the stake to Unit Trust of India.

Meanwhile, interest in paint stocks seems to be on the rise keeping in mind the improvement in cement offtake and housing loan disbursement figures, which are seen as indicators of construction activity and directly affect the decorative paint market.

For the first quarter of 1999-2000, Asian Paints has posted a 11.4 per cent increase in its net profit over the corresponding period last year. While sales increased by 10.6 per cent over the same period, profit before tax stood at Rs 23 crore (1997-98: Rs 19.51 crore).

During the current year, the company should benefit from its increased capacity. While the expansion of the Patancheru (Andhra Pradesh) plant adds around 37,600 tonnes to its total capacity, the Kasma plant should contribute another 31,650 tonnes.

BSES

New Projects

Power distribution and generation major BSES, which supplies electricity to Mumbai's suburbs, only managed to marginally improve its bottomline in 1998-99. Net profit rose by a mere 2.5 per cent, despite a 13.1 per cent increase in net sales over the previous year. This was largely due to a sharp increase in tax provision, which rose from Rs 35 crore to Rs 80 crore. Keeping in mind that the company's income from EPC contracts, computer and international divisions sky-rocketed 359 per cent to Rs 500.4 crore in 1998-99 from Rs 109.1 crore in 1997-98, the mere Rs 6.5 crore increase in the company's bottomline was unimpressive. But for the rise in income, the company's net profit might actually have been lower than in the previous year.

BSES has been engaged in distribution of power to Mumbai for nearly 75 years and covers an area of 220 square kilometres between Mahim to Bhayandar. During the year under review, revenue from sale of electrical energy to the western region grid was lower than in the previous year. Further, reduction in fuel adjustment charges in the tariff also decreased the value from sale of energy.

Meanwhile, for the first quarter of 1999-2000, BSES has posted an increase of 11.4 per cent in net profit over the corresponding period last year. While total income rose by 10.4 per cent, income from the EPC division, computer and international division touched Rs 193.3 crore.

BSES is now planning to set up two more projects. The first is a 500 mw coal-based project in Amravati while the second is a 500 mw gas-based power project in Delhi and Bihar. The latter is to be set up jointly with Gas Authority of India (GAIL) and Damodar Valley Corporation. The company also plans to enhance the capacity of its Kerala and Andhra projects.

Its capital expenditure plans entail an investment of over Rs 2,000 crore over the next couple of years. As a part of its resources mobilisation programme for the ongoing and new projects, BSES plans to float a global depository receipts issue at the beginning of 2000. It has already tied up term loans amounting to Rs 750 crore from various banks and financial institutions for its Rs 220 mw project at Samalkot in Andhra Pradesh and the 86 mw second phase of the Koclin project in Kerala.

Recently, BSES has taken over management control of the state-owned power distribution company, Gridco, in Orissa for Rs 117 crore. While BSES holds a majority 51 per cent stake in three of the state-owned company's four distribution companies, Gridco will hold 39 per cent and the Employees' Trust will hold the balance 10 per cent. The three distribution companies, namely, Nesco, Southco and Wesco, are responsible for power distribution in different zones of Orissa.

GESCO

Trying Times

Great Eastern Shipping Company (GESCO) saw a lacklustre performance in 1998-99. Total income increased, albeit marginally, by 2.5 per cent over 1997-98, but the company's operating profit declined by 7 per cent and net profit plunged by 23.5 per cent.

The performance of the company's dry bulk fleet came under severe pressure during the year with both vessel earnings and values showing steep declines. In fact, while earnings from Handy/Handymax

NA: means not available.

vessels hovered marginally above their operating costs, earnings from Panamax vessels fell below operating cost level. A lower profit on sale of vessels coupled with a fall of about 8 per cent in the number of vessel operating days following the reduced fleet only added to the pressures on margins. The company claims that its earnings would have been even lower but for the fact that the fleet exposure was hedged through committed cargo contracts and period charter contracts. Another encouraging turn was that while yields for similar vessels in the market dropped by 30 per cent, time charter yields of the company's dry bulk fleet dropped by only 18 per cent in dollar terms.

The continuing effect of the South East Asian crisis resulted in lower trade volumes in the Asian region. This, coupled with the general decline in the tanker and LPG markets had a negative effect on the performance of the company's tanker division earnings.

In a major move, GESCO now plans to demerge its property business and concentrate on its core competency, namely, shipping. The current shareholders will be allotted shares in the new company in the ratio of 1:10. Apparently, the diverse nature of its two businesses has affected the company's overall performance in the past. The low real estate prices prevailing and the falling freight prices have only made matters worse. GESCO has huge funds blocked in real estate which makes managing day-to-day operations difficult.

The demerged real estate business will function under the name of Gescor Corporation and will have a paid-up capital of Rs 28.76 crore. Consequently, the paid-up capital of GESCO will decrease from Rs 287.6 crore to Rs 258.8 crore. While properties worth Rs 120 crore are expected to be sold in the next 12-18 months, the rest of the property will be developed as commercial centres.

Though the move is expected to help GESCO focus on its strengths, it will require more than just a restructuring to perform well. Most importantly, an increase in freight prices will help the company shake off the trying times. Fortunately, the company has decided to reduce its dependence on freight prices by strengthening its offshore operations, which include operating offshore support vessels, oil drilling rigs, harbour tugs and marine construction.

DISCOUNT AND FINANCE HOUSE OF INDIA LIMITED

Statement of Shri P. G. Kakodkar, Chairman of the Board of Directors of the Discount and Finance House of India Limited at the Eleventh Annual General Meeting held at Mumbai on September 27, 1999

It gives me great pleasure in welcoming you all to this Eleventh Annual General Meeting of the Company at our new premises. I am particularly delighted to note that DFHI has completed eleven years of successful operations and over this period has grown remarkably well with the net profit going up tenfold and the business turnover increasing manifold. I am happy to state that the Company is well positioned to scale further heights in the coming years.

Performance during 1998-99:

The report of the Directors and the audited accounts of the Company for the year ended March 31, 1999 have already been circulated and with your permission, I shall take them as read. Before mentioning the salient features of the Company's performance during the year under review, I consider it obligatory on my part to touch upon the developments in Indian economy in general and in the Government securities and money markets in particular as this has got substantial bearing on the performance of your Company.

Indian Economy:

The growth rate of Indian economy during the financial year 1998-99 as measured by Gross Domestic Product (GDP), is estimated at 6.0%. This is an improvement over the growth rate of 5.0% achieved in 1997-98, mainly due to the turnaround in agriculture. However, the contribution of industrial sector to GDP during the year was much lower than in the previous year. Growth in industrial production, as measured by the Index of Industrial Production (IIP), declined from 6.8% in 1997-98 to 4.0% in 1998-99.

The export performance remained sluggish almost throughout 1998-99 registering a decline of 3.9% in Dollar terms as compared to the previous year. The slump in world trade coupled with erosion of competitive advantage of Indian exports on account of steep depreciation of East Asian currencies had its impact on India's export performance. Imports also registered slower growth during 1998-99 at 0.9% as compared to 6.0% during the previous year.

The primary equity market continued to be dormant during 1998-99. In the absence of quality equity offerings, fixed income securities, mostly from the financial institutions, attracted significant investor interest. The amount mobilised through debt instruments in the primary market during the year was higher than in the previous year.

Money Market:

As a result of ample liquidity in the system during the first half of the financial year 1998-99, the money market interest rates were mostly in the range of 6.40 - 7.85 per cent. The more than comfortable liquidity position was attributed largely to lower off-take

of non-food bank credit and inflow of foreign currency resources. However, the gross mobilisation during 1998-99 by way of Treasury Bills was considerably less as compared to the year 1997-98.

Government Securities Market:

In the first quarter of 1998-99, easy money market conditions enabled RBI to complete about 42.8 per cent (Rs. 33,810.30 crore) of the gross budgeted market borrowings of the Government of India. By the second quarter, 75.46 per cent (Rs. 59,900.4 crore) of the gross budgeted market borrowing programme was completed. And by the third quarter, thanks to continued availability of liquidity in the system, the Government of India had not only completed the gross market borrowing programme but had raised an additional amount of Rs. 4,376.82 crore taking the total amount of borrowing to Rs. 83,752.82 crore. In addition, the State Governments also mobilised an aggregate amount of Rs. 12,118.22 crore from the market.

Despite the large scale gross borrowing by the Central and State Governments, the medium- and long-term interest rates during the course of the year remained fairly stable. This was possible partly because of the easy liquidity conditions as mentioned earlier and mainly due to the efficient use of OMO by RBI. RBI also smoothened the yield curve of dated Government securities by issuing Government securities of different maturities.

Review of operations during the Financial Year 1998-99:

Let me now turn to the working results of your Company during the year 1998-99. The gross profit of the Company (before depreciation and taxation) was Rs. 90.55 crore as compared to Rs. 105.28 crore for the previous year. Net profit for the year 1998-99 is relatively lower at Rs. 58.41 crore when compared with Rs. 67.92 crore recorded in the previous year.

The decline in the Company's gross as well as net profits during the year 1998-99 is in line with general downward trend noticed in the profitability of operations of the majority of the financial intermediaries. The reasons for the decline can be attributed to the increase of 60.51 per cent in the interest expenditure coupled with a sizeable reduction in the spread between the interest received and interest paid on the business operations. However, despite the lower profit for the year 1998-99, the Company's business operations continued to be quite healthy and on the upturn inasmuch as there was significant increase in turnover in Government securities and call money transactions. Incidentally, the Company, in pursuance of the policy recommended by the Management Consultants, has been diversifying its assets portfolio. Accordingly, the Company

recorded a turnover of Rs. 144 crore in CP segment as against 'nil' turnover during the previous year. Similarly, it achieved a turnover of Rs. 50 crore in CD segment as compared with a small turnover of Rs. 5 crore in the previous year. The Company's outstanding investments in Corporate Bonds, Debentures, etc. stood at Rs. 92.75 crore as at the end of the financial year 1998-99 as against 'nil' investment during the previous year.

In the previous three years, i.e. in 1995-96, 1996-97 and 1997-98, the Company declared a dividend of 14 per cent. Although the net profit of the Company for 1998-99 has been lower, your Directors would like to maintain the payment of dividend at the previous three years' level.

Other Development in 1998-99:

The Company has already put in place a risk management system recommended by the Management Consultants. Further, the Company has set up an Asset Liability Committee (ALCO) comprising the Company's senior management officials. The scope of the Committee covers areas such as management of market risk, funding and capital planning, profit planning and growth projection and trading risk management. The above initiatives are expected to qualitatively enhance the performance of the Company.

Y2K Compliance

The Company was using a software developed in-house in 1995 using dBase V based system which is Y2K compliant. To enhance the efficiency of operation, the existing software is being upgraded with RDBMS - Oracle/Developer 2000. The Phase I of the software development covering the day-to-day operations of the Company has been completed and tested. The hardware also has been replaced with the latest Y2K compliant units. Thus, the total system is fully Y2K compliant. The Company has also developed a contingency plan in accordance with the guidelines issued by RBI.

Review of operations during the current Financial Year 1999-2000:

In the Monetary and Credit Policy for the year 1999-2000, which was announced by RBI on April 20, 1999, several measures have been introduced to strengthen the money and Government securities markets. Some of them are follow-up measures of the implementation of the Narasimham Committee II suggestions. One such is the aim to make call/notice/term money market a pure inter bank market with access to PDs. This is proposed to be implemented in a phased manner so that the existing lenders in the market will have operational flexibility to adjust their asset/liability structure. Keeping this aspect in view, RBI has decided to widen the repo market by allowing more non-bank

entities to deploy their short-term funds in this market. However, this is restricted to only those entities who have SGL account and current account with RBI at Mumbai. This needs to be enlarged by permitting other non-bank entities to operate in the repo market at centres other than Mumbai and also by permitting them to do so through constituent SGL account.

During the first quarter of the current financial year 1999-2000, the call money market generally witnessed a steady trend as the call rates moved in the band of 7.00 to 9.50 per cent barring a few instances of hardening in the month of May 1999 and in September 1999 when the rates touched a level of 12 per cent on account of outflows of funds for subscription to new Government loans and due to short-term liquidity problems. The weighted average call money lending rates of DFHI during the period under review ranged between 7.64 and 9.38 per cent. Relatively easy money market conditions mainly arising out of lackadaisical growth in bank credit and reduction in CRR by a half percentage point from 10.50 to 10.00 per cent effective from fortnight beginning May 6, 1999, enabled RBI to complete about 44% of the gross budgeted market borrowing of Rs. 84,014 crore of the Government of India by the end of June 1999. For mopping up excess liquidity in the system, RBI continued to use the mechanism of Fixed Rate Repo and reduced the rate from 6 to 6 per cent effective March 3, 1999. However, the market participants did not show much interest in this instrument as the call rates generally ruled above 6 per cent during the period under review.

The Company's turnover in the major segments of its activities during the current financial year upto June 30, 1999 as compared to the corresponding period of last year was quite impressive. During the current financial year so far, the market preference being for dated Government securities, which carry relatively higher yield, the Treasury Bills segment has remained somewhat subdued. As a consequence, the Company has to carry higher stock of Treasury Bills. In spite of such a situation, the overall turnover of the Company in primary and secondary markets including repos in Treasury Bills segment was higher at Rs. 1,720 crore than Rs. 1,567 crore in the corresponding period last year.

During the period upto June 30, 1999, the Company has achieved significant increase in its Government securities outright turnover which stood at Rs. 6,574 crore as compared to Rs. 1,212 crore in the corresponding period last year. The aggregate turnover in primary and secondary markets was also substantially higher at Rs. 11,201 crore as compared to Rs. 4,618 crore in the corresponding period of the previous year.

The share of dated Government securities in the overall portfolio of the Company is on the increase primarily because of market preference for these securities when compared to Treasury Bills as the gap on the yields on dated Government securities (of maturity above one year) and Treasury Bills has narrowed considerably and the cost of funds on occasions, is more or less in line with the yields on short dated Treasury Bills.

Other Observations and Suggestions:

RBI's latest monetary policy document has dealt in detail about the various structural reforms in the money market. With a view to enhancing the depth and liquidity in the Government securities market, RBI has put greater emphasis on the institution of primary dealers. RBI expects that PDs should play a larger role in the absorption of the primary issues and in market making. In order to promote the retail market segment, the Reserve Bank also has taken steps to revamp the system of liquidity support to

PDs, at the same time increasing the number of primary dealers. As a part of our efforts for the development of the Government securities market and creating greater awareness among investors, a half-day seminar was organised at Ahmedabad on March 17, 1999. Similar half-day seminar was organised by the Company at Bangalore on April 9, 1999. In addition, to increase the coverage of our money market operations and development of the Government securities market by securing a larger reach among investors, we have decided to open the sixth branch of the Company at Hyderabad.

The five existing branch offices of the Company in Ahmedabad, Bangalore, Calcutta, Chennai and New Delhi have been functioning for a period well over 7/8 years. Basically, their main area of activities continues to be call borrowing/lending and to some extent in notice/term money segment besides some trading in commercial bills. The share of the branch offices in call/notice/term money dealing constitutes around 30% of the total turnover of the Company. With an intention to enlarge the scope of the activities of the branches, it has been decided to permit them to deal in Treasury Bills and dated Government securities.

In spite of increase in the number of players in the Government securities market, your Company has been able to maintain its market share besides being the major player in the call money market. In 1998-99, DFHI had 36.45 per cent of market share in call money borrowing and 60.39 per cent in call money lending, which was highest among the Primary Dealers. To retain the current share in business and improve the profitability, the Company had realised that it is absolutely essential that the quality of infrastructure (both in terms of men and material) is substantially enhanced. Your Company had already taken steps to induct additional qualified and experienced staff through a process of rigorous selection from the open market. The Company had also shifted its operations to a more spacious premises with better infrastructure facilities. And with the proposed upgradation of the system and the risk management techniques in place, your Company is now well positioned to face the emerging challenges.

Let me make a mention of some of the significant emerging issues in the debt market with particular reference to Government securities market and their operational relevance to market intermediaries like PDs in general and to your Company in particular.

It is a matter of great satisfaction that RBI has been stepping up its activities in the furtherance of debt market while coming out with wide ranging initiatives in regard to deepening of Government securities market. The introduction of derivative products, STRIPS, enlargement of the scope of the repo market, etc. apart from other aspects mentioned elsewhere are some of the positive steps taken by the RBI in this regard. While the success of these efforts would depend to a large extent on the architecture of the market, RBI as a regulator has the objective of preserving the integrity of the market primarily to boost the investors' confidence. A significant factor in this regard relates to market surveillance. Promotion of transparent market with sufficient disclosure of information on price and other areas of the transaction will assist traders to self supervise their transactions. However, the current market practices are quite poor on transparency requirements. Electronic markets easily allow market surveillance with real time monitoring and also leave audit trails. It is, therefore, absolutely essential alongside the expansion of the market that we move towards total electronic trading so that supervision of market intermediaries does not become quite onerous.

The necessity of the institution of Primary Dealers is well recognised in a market where holding of Government securities is concentrated in

institutions with large sized portfolios and having immediate demands and where the Government financing requirements are sizeable and borrowing calendar is fixed and not very flexible. Support by way of underwriting of primary issues is also undertaken by the PDs as part of their efforts in distribution and trading of the securities. In a market where two way quotes are not fully developed such intermediaries are exposed to substantial liquidity risk. The risk becomes more acute if such primary issues are released in quick succession and also followed immediately by open market operations. In the absence of liquidity, the average time the PDs hold on to such sub-optimal portfolio of securities is prolonged, increasing the risk of exposure to changes in market conditions. In such a situation, market-making support through secondary market window whereby RBI buys securities (in addition to selling) from the PDs under certain conditions is a proposal worth examining. Such secondary market support (in addition to the existing liquidity support) can be in any one of the undernoted forms as is being followed in some of the countries:-

1. Entertaining switch deals from PDs between less liquid into more liquid currently traded outstanding issues.
2. Purchase of maturing securities (just before maturity date) and sale of new issues, the new primary issues will be on the offer side and maturing securities will be on the bid side.
3. Entertain reverse repo upto a specified percentage of secondary market turnovers at rates in line with the yields of the underlying security.

Such initiatives from RBI will tend to reduce the liquidity risk of PDs and encourage them to supply two way quotes, and maintain continuous market condition.

With the unabated emphasis on liberalisation of the financial market and Reserve Bank of India becoming obligingly market savvy, there has been a robust growth in the number of players and variety of instruments and products. To choose among such plethora of options, consumers may rely to an increasing extent on trusted names, resulting in brands of preferred financial service providers or advisors becoming valuable and sought after. Your Company having established an excellent reputation in the market has an unique opportunity to cash on these developments and come out with products/services that are closely linked to its area of proven expertise. Given an environment which gives unfettered rein to entrepreneurial talents, let me assure you that your Company will not be lagging behind in grasping these initiatives and move forward.

Acknowledgement

Your Directors take this opportunity to sincerely thank the Government of India, the Government of Maharashtra, the Reserve Bank of India, all Commercial and Co-operative banks, All-India Financial Institutions, National Stock Exchange and approved Brokers for their goodwill and whole-hearted co-operation extended to the Company and look forward to their continued support in future as well.

Your Directors wish to place on record their sincere thanks to Reserve Bank of India and State Bank of India for lending the services of their experienced managerial personnel to the Company. Your Directors also wish to place on record their appreciation for the dedication and competence shown by the Company's team of officers and other staff in the past and look forward to their sustained commitment to enable the Company to retain its role as a key player in the Money and Securities markets.

Calcutta Diary

AM

When ideology and realpolitik come in conflict, ideology has to take a back seat. As the hour struck for the resolution on the referendum on East Timor's independence to be voted upon in the UN General Assembly, India was a non-enthusiastic joiner-in. For realpolitik, read Kashmir. The problem will however not go away. Other interested people are around: they will increasingly refer to the nexus between Kashmir and basic human rights.

IS it already all safe ancient history? Even as late as the seventies, India's voice was among the most strident in United Nations fora in the cause of East Timor independence. India of course was not alone, the overwhelming majority of the Group of 77 countries lent their support to the East Timorese. The western powers by and large continued with their traditional reservations: a politically emancipated East Timor will mean the end of the exploitative role of the international oil corporations and their domestic hangers-on. The weight of moral authority however rested with the revolutionaries; the United Nations General Assembly resolutions reflected the global support they were assured of.

The Soviet Union was still a major presence in the comity of nations; in terms of military prowess, it was thought to be almost on par with the US itself. It therefore did not require excessive courage on the part of third world nations to toe the vociferously anti-colonial East Timor line. The objective of the revolutionaries battling on in the Indonesian island was not the formal wresting of independence alone. Their gaze strayed much beyond; the achievement of an effective social revolution, at the end of which land will be equally distributed and opportunities for enjoying the basic human rights more evenly dispersed. A relevant additional datum was, and is, the ethnic roots of the islanders, setting them apart from the mainland Javanese.

Occurrences since the late eighties have set things even more topsy-turvy than they should have been. The Soviet Union has come to a sorry end; the global drive toward eliminating the last vestiges of colonial subjugation suddenly became a bit of a joke. Whatever external help was trickling in from the international brotherhood of working people for the insurgents in East Timor soon dwindled to insignificance. It was a lonely time for the East Timorese. But their grit saw them through, even as the Indonesian army was fast reaching the end of its tether. The arch reactionary western regimes could not demur at the proposal to have a referendum on the East Timor issue, to be arranged under United Nations supervision in terms

of a formal General Assembly resolution. The military occupiers of the island did not for a moment discard their malevolence; they too could not however come up with a tolerably credible apologia for opposing the referendum.

It was a daring concept, inviting the people of the island to decide in a direct vote whether they desired self-rule. The vast majority of the third world nations have had no stakes in other people's lands. Their anti-colonial and anti-imperialist credentials were beyond dispute, they endorsed with excitement and enthusiasm the proposal for a referendum for the endorsement of East Timor independence.

But times change, and India was no longer found in this crowd. When ideology and realpolitik come in conflict, ideology has to take a back seat. For realpolitik, read Kashmir. In the United Nations General Assembly, this country's traditionally anti-colonial voice has grown thinner and thinner with every day. When the hour struck for the resolution on the referendum to be voted upon, India was a non-enthusiastic joiner-in. Enlightenment had all of a sudden begun to sink in. The formula of a referendum to decide whether the populace in a backward, dependent territory are entitled to receive their independence has awkward implications. If a referendum is agreed to as in the case of East Timor, how could it be denied to the people of Kashmir, more so given the existence of a fifty-year old resolution passed by the UN General Assembly recommending a plebiscite to settle the issue? Precedents are occasionally an inconvenience. Self-interest being self-interest, as far as New Delhi is concerned, East Timor has ceased to be a priority item.

The problem will however not go away. Other interested people are around; they will increasingly refer to the nexus between Kashmir and basic human rights. Whether the government of India likes it or not, some political developments distasteful to it seem inevitable in the wake of the Kargil mini-war. Irrespective of whether the hostilities were called off under intense American pressure on both the warring countries, India's international bargaining position has without question actually

weakened in the wake of Pokhran and Kargil. The way the elections to the Lok Sabha have gone in the valley is likely to create further complications. Even on official reckoning, barely 15 per cent of the electors in the valley chose to participate in the polls. A huge majority of the population there, it is abundantly clear, are not in the least interested in the alluring programme New Delhi draws up for them. Perhaps it was different in the days when Sheikh Mohammed Abdullah was in control and his National Conference had an agenda which raised an echo in the hearts of the Kashmiris. It is now a different ambience altogether; the National Conference has been reduced to a narrow self-serving family outfit, and got corrupted over the years. The virtual take-over of the valley by Indian troops is now providing a tragic epilogue to the entire story.

Everything is fair in love and war – and in the general elections. For electoral as well as extra-electoral reasons, the established political parties are trying their utmost to extract the last grain of advantage from the border clashes. Their calculations have little to do with the wishes and predilections of the valley's people. Indians at all levels will conceivably find it difficult to accept the implications of this piece of verity, but a globalised environment will increasingly lay bare the facts of life. For example, to the practical-minded Americans, whining insistence on observing the tenets of the Simla Agreement of 1972 will be an irritant.

But please take it easy, our mandarins have created enough of opportunities for the superpower to indulge in some twisting of our arms. In fact, the Indian political parties one and all are in a jam. None of them can, for domestic reasons, afford to yield an inch of ground on Kashmir. The valley, the cliché keeps being blared out, is an inalienable part of India, which no power on earth, not even the great and good Americans, can take away from us. Most of these parties, for dear liberalised life, would like to be on the right side of the Americans though. The dilemma is therefore acute.

Given this background, it is going to be awkward in the extreme to be called to look for the fifty-year old commitment for a Kashmir plebiscite. To add insult to injury, there are enough cheeky people now around, both in the United Nations and outside its premises, who may remind our government that whatever political support we once enjoyed amongst the people of Kashmir has, on the eve of the new millennium, evaporated into nothingness.

It is going to be a rough, tough terrain. The administration in New Delhi, whatever its political colour in the post-poll climate, will be, day in and day out, nagged by the superpower. This is only natural, given

our growing dependence on it in economic matters. This is where the East Timor issue too attains a fresh relevance. The natives of that helpless island, 72 per cent of them, have opted for freedom in the just-concluded referendum. They were punished heavily by the Indonesian army for this cheekiness. But things are falling in place. After much humming and hawing, Jakarta has accepted the idea of an international peace-keeping force. Our government has kept mum, congratulating neither the Jakarta junta nor the freedom fighters in East Timor. The notion of a freedom-granting referendum, followed by an international peace-keeping force to guide the transition, is no longer dear to New Delhi. Kashmir casts its shadow. The co-ordinates are no longer the same as in the days of yore.

Those citizens who would like to discuss the underlying issues in a frank non-clandestine manner run the risk of being dubbed, in this heady season, as rank anti-patriotic. But never mind, we will be made to learn our lessons the hard way. And could it be that, sooner or later, colonial decision-makers operating from overseas posts will decide, on our behalf, what is patriotism and what is not?

Between the exit polls and the real thing, the hiatus is just about to disappear. The Kashmir problem will not go away. Now that the campaign days are over, responsible political parties need to sort out which direction their thoughts ought to turn to. But who is to decide the inner meaning of the qualifying clause 'responsible'?

contrast, scores of middle level officers of Indian banks, the small guys with no clout, who have been implicated in the scam, often for technical offences, have simply been destroyed. Abandoned by their organisations, most of them have no funds to ensure adequate legal defence or deal with the slow and often corrupt investigation process.

No country can lay claim to a modern and international class financial market unless it knows how to handle financial scandals and irregularities. This implies building confidence in the regulatory process through swift detection of irregularities and deterrent punishment handed out within a meaningful time-frame.

There are the inevitable comparisons with Nick Leeson, architect of the collapse of the blue chip Barings Bank, who is out on parole, having served his sentence. Or the famous eighties imbroglio involving Drexel, Burnham Lambert Inc — a scandal probably on par with the Securities Scam in India. But investigations were conducted with precision and the main accused, Mike Milken and Ivan Boesky, swiftly sent to jail.

In the Indian situation, the multi-departmental Janakiraman Committee was on the right track and did an excellent job in piecing together the scandal; its only flaw of not having spoken to the accused could have been easily rectified by a judicial commission. But the Janakiraman Committee was discredited because the spotlight had turned on inaction by the Reserve Bank of India itself. Curiously, while there is a continuing clamour for action against the then RBI governor, there is no mention of the case for punishment of the people who were actually in continuous charge of the Department of Supervision for over a decade. The government then insisted, probably deliberately, on blundering further by setting up a multi-party Joint Parliamentary Committee (JPC) and ignoring the fact that several politicians from the ruling party were themselves under suspicion for diverting several hundred crores of rupees from public sector undertakings to brokers and banks under the guise of portfolio management schemes.

The JPC allowed politicians cutting across ideologies to either chase their own particular *bete noirs*, indulge in the most reprehensible horse-trading and leak confidential documents. Two reports later, the JPC is remembered only for the people it let off the hook rather than for its contribution towards improving the system. It also allowed the CBI to pick and choose which cases to pursue and those it should let off. It is no wonder then that the cases against politicians such as B Shankaranand or the Goldstar case involving a former prime minister's sons are not even heard of.

COMMENTARY

Harshad Mehta's Conviction How Not to Handle Financial Crimes

Sucheta Dalal

No country can lay claim to a modern and world class financial system without knowing how to handle financial crimes and scandals. This calls for building up confidence in the regulatory process through swift detection of irregularities and deterrent punishment within a meaningful time-frame.

THE first reaction to Harshad Mehta's conviction in a case related to the Securities Scam of 1992 is one of relief that the judicial system, though excruciatingly slow, still works. You then realise that the conviction by the Special Court is just one stage of the judicial process and still needs to be upheld by the Supreme Court. This could easily take another three years.

There are 600-odd civil cases relating to the scam pending in the Special Court (the number would have been larger but for the sensible decision by several foreign banks to write off their losses and not press charges). Out of 72 charge-sheets filed by the Central Bureau of Investigation (CBI) for criminal offences, only 46 cases have been filed and of these only three have been disposed of by the Special Court — including the latest one convicting Harshad Mehta. At the pace at which the trial has been proceeding, the scam investigation could easily carry on for the next two decades. In fact the process may actually slow down if a successor to justice Rane, who retires in November, is not found soon enough.

It would also be no surprise if the cost of the litigation in several civil cases is higher than the disputed amounts. As things stand, even safe and stodgy investments

such as the Indira Vikas Patra double one's money in a little over five years. If one includes the opportunity cost in terms of having this money blocked up in litigation, the size of the scam could double from the current estimates of about Rs 5,000 crore. So far, the custodian appointed by the government has recovered very little of the money lost.

The litigation itself has turned increasingly meaningless over time, because many of the main accused and key witnesses have died or are no longer available. All senior CBI officials originally connected with the investigation have been transferred. S P Gadhe, the DIG who initially headed the investigation, passed away four years ago. So have others such as National Housing Bank chairman Manohar Pherwani, State Bank of India (SBI) chairman M N Goiporia, SBI's deputy managing director C L Khemani and chief of vigilance R L Kamat and K Dharmapal, the managing director of Fairgrowth Financial Services.

At the same time the country-heads and treasury-chiefs of all foreign banks have all quit their jobs and most of them are no longer in the country. Many of them have been paid truly hefty severance packages to make the parting bearable. By

All this is all the more disheartening because way back in 1956, the brilliant enquiry into the Mundhra scandal by Justice M C Chagla had already established an excellent precedent for clean and fair investigation. Justice Chagla, while deciding on a public hearing in 1956, had said, "After very anxious consideration I have decided that this enquiry should be held in public. A public enquiry constitutes a very important safeguard for ensuring that the decision will be fair and impartial. The public is entitled to know on what evidence the decision is based. Members of the public will also be in a position to come forward at any stage to throw more

light on the facts disclosed by the evidence. Justice should never be cloistered – it should be administered in broad daylight." He also decided to take evidence on oath so that those who gave evidence did so with a sense of responsibility and knowledge of "the consequences of giving false testimony".

The Mundhra enquiry was wrapped up in two years, including the appeal to the Supreme Court. In contrast, the JPC insisted on a convenient closed-door investigation with selective briefing of journalists at the end of each day. The investigation into the scam has lost its relevance ever since.

Participatory Irrigation Management Experiments in Andhra Pradesh

Jasveen Jairath

In 1997 the AP Farmers' Management of Irrigation Systems Act was passed to enable the participation of farmers in the maintenance of irrigation systems. While this has led to many initiatives on the irrigation and water-use front, the reforms now need to be carried forward beyond supply-side initiatives to include the critical realm of end-use regulation of water, which would affect cropping patterns and agricultural practices.

ANDHRA PRADESH has three major rivers, Krishna, Godavari and Pennar, whose dependable flows are 2,746 TMC of water, of which 1,846 TMC has been tapped for irrigation, creating an irrigation potential of 4.8 million hectares under major and medium projects. Out of this only 2.84 million hectares is being irrigated, reflecting a gap of about 41 per cent. According to the note on the state's Farmers' Management of Irrigation Systems Act of 1997 (irrigation department, government of AP), "existing usage of water is inefficient, wasteful, inequitable with tail end deprivation being almost universal. Further, widespread deterioration of infrastructure with little or no participation of farmers has aggravated the low utilisation of water of irrigation commands." The area irrigated under some of the major and medium projects was shrinking, in spite of secular increase in capital expenditure (corrected for inflation) and increasing M and O expenses. Finally, the financial returns to the investment in irrigation were very poor due to low rates of watercess and low rates of fee collection. That the performance of irrigation projects in the state on technological, managerial and financial fronts was very poor, was well recognised and acknowledged within the government circles.

The AP Farmers' Management of Irrigation Systems Act was passed against this backdrop in the legislative assembly

on March 27, 1997. The main objectives of the legislation were to provide a legal backing for implementing measures to institutionalise the participation of irrigation users in the operation and maintenance of irrigation systems. That is (1) ensuring equitable and reliable supplies; (2) bridge the gap in ayacut through preparation of suitable operation plans; (3) bring about social audit and water audit in irrigation; and (4) enable the department to withdraw from M and O, and concentrate on the reservoir management and development of new systems. The thrust was on decentralising irrigation management and thereby, according a greater responsibility as well as greater powers to bodies comprising elected representatives of water users. Involvement and control by the users at the local level, it was believed, would constitute an incentive to improve operational performance. The entire exercise would lead to improvement in quality and cost efficiency of irrigation management leading to increased profitability of irrigated agriculture – often in spite of increased cost of irrigation to the user. The process was perceived to be a cost saving venture for the government wherein the released resources could be used elsewhere.

The proposals for operationalising the above ideas envisaged the creation of an institutional structure of irrigation water user with water user associations (WUA) as its basic elements. The main features

of these proposals, as spelt out in the act, may be summarised as follows: (1) The act is applicable to all irrigation schemes major, medium and minor except those under panchayat raj institutions and all minor bodies in the scheduled areas of AP. (2) Every irrigation project would be divided into convenient areas of operation of the project and distributary committees, and WUA at the primary level. The delineation of the areas would be done on a hydraulic basis, which are administratively and functionally viable. (3) Depending on the type of irrigation scheme, there may be single, two or three-tier system of associations/committees. (4) WUAs are the primary organisational units of irrigation water users. Each irrigation scheme may comprise one or more WUAs. While medium and minor projects could comprise of a single WUA, depending on the ayacut, the major projects could be divided into few hundred WUAs, depending on the spread of the ayacut and the spatial distribution of distributaries. These primary units of water users shall regulate and distribute water within its command area. The total area of operation of a WUA will be divided into 4-10 constituencies, depending on the command area. Each constituency shall elect a member of the managing committee of the WUA and shall directly elect the president of the WUA as well. (5) A group of WUAs under a distributary or a group of small distributary comprises a distributary committee (DC). The presidents of all WUAs in a DC are members of a DC. Together they are to select the members of the managing committee and the DC president, who will be in charge of the distributary related matters. (6) Project committees are apex bodies concerned with the management and distribution of water in the command of major and medium projects. All the DC presidents will be members of the PC. The entire project command is to be divided into 7-11 constituencies to ensure adequate representation. The PC will elect a president and 7-11 managing committee members from each constituency. (7) An apex committee chaired by the minister of major and medium projects shall be constituted to formulate broad policy guidelines for the various committees in its command and act as the final decision-making body for resolving disputes. (8) All landholders within localised/authorised area including title holders, tenants and whose name is found in Record of Rights shall be members of WUA with voting rights. All other water users either from non-localised areas or users for non-agricultural purposes will also be co-opted as members but without voting rights. (9) These organisations are charged with the following main functions: preparation

of operational plans at the beginning of each season; prepare a panel of auditors for auditing accounts; maintaining of an inventory of irrigation system within its command; maintenance of records, accounts, list of members and implementing the decisions of the higher committees; preparation of the maintenance plan of the distributary and drainage system of the irrigation project within its command and execute local maintenance works; social audit and water budgeting; conflict resolution; and resource mobilisation.

(10) The resources of these organisations would be: government grants as a share of water fee collected; development grants; loans raised from any scheduled or co-operative banks; income from any sources attached to the irrigation sources; levy or special tax for taking up specific works as agreed upon by the general body of the organisation.

(11) The significant features of the proposals are:

- The right to recall of the president if the general body members are dissatisfied is indeed novel. Provisions have been made for recall of the president if there is a one-third majority of the general body members

- Membership is based only on the fact of owning land in the authorised command of the WUA and not on the extent of the land owned.

- Control over water use is in the hands of localised irrigation water users at the expense of non-irrigation users of water

- Women and landless are excluded from any involvement in water management in the area. The high levels of public investment in irrigation which impact the entire community - directly and indirectly - focus on a fraction of the population i.e. those who practise irrigated agriculture.

Following these proposals and passing of the act in 1997, elections for more than 10,000 WUAs were held (one president and technical constituency members as per the WUA command) and constituted. Subsequent to the elections, extended training was provided to government officers and presidents of WUAs to sensitise them about PIM - its features and its necessity. During the first year activities taken up in canal irrigated areas took the form of silt clearance of channels, followed by strengthening of embankments, small repairs of pipe outlets and drop structures, plugging of breaches, etc. The emphasis during the second year has shifted to the fixing of shutters at the various offtake points. This is significant, as existence of shutters is a precondition of any attempts to institute water regulation. Technical systems of water regulation are a necessary although not a sufficient condition, for implementing any rules of water distribution within water users at the field level and within distributaries at the main system level.

As of now there exists hardly any systematic method of equal water sharing. The water is continuously flowing in all the channels (depending on the quantum of water releases at the head of the system) throughout the irrigation season. As such, the ease of water availability to a user is in proportion to the distance of his land from the head of the irrigation system. Head refers to head of the system, head of the distributary and head of the minor. Similarly tail end refers to the end of a channel - main canal, distributary and minor. The water availability reduces progressively as you proceed towards the tail of a channel. The tail end of a minor at the tail of a tail-end distributary will bear the accumulated losses en route. Similarly, it is possible that the tail end of a head end distributary may get plenty of water while the head end of a tail end distributary gets meagre or uncertain supplies.

In principle, water distribution according to the act is supposed to be on a per acre basis with the cropping pattern left entirely to choice of the farmer. However, as of data, the distribution principle in operation was 'first come first serve' - 'come' in the sense of location of the farmer's plot of land from the source of water. Traditional discrimination based on locational disadvantage exists. In addition there is the disadvantage of smaller size of landholding of the majority of the farmers. Although the DCs did have meetings with the respective irrigation department personnel on the availability of water in the reservoir and the possibility of releases during the ensuing season, this could only be for information. It did not reflect a greater control over the releases or distribution - however, it did create the possibility of farmers planning their production pattern according to the expected supplies. But in the absence of an effective communication system, it is unlikely that such information would reach the general body of farmers for them to respond by taking preemptive action. There was thus very little that is in evidence on redressing the imbalance on the equity front - both the head-tail and land-based inequity regarding distribution of water - due to formation of WUAs and DCs.

Many public discussions (workshops/seminars/publications) have been replete with many a reference to organisations, individuals and experiences vis-a-vis their contribution to and role in participatory irrigation management initiatives. This generates a sense of euphoria and complacency that all is well and we can doze off peacefully. However, one cannot help feeling somewhat uneasy at this emerging state of stupor. To strike a discordant note is deliberately attempted in this piece to provoke a lively debate and evoke counter viewpoints which may tease us out of the peaceful slumber.

The following are some preliminary ideas and perceptions on the experience of PIM in Andhra Pradesh. They are based on an ongoing research project at Centre for Economic and Social Studies, Hyderabad, on the assessment of PIM in Andhra Pradesh. The initiatives on participatory irrigation management in Andhra Pradesh are indeed laudable for their scale and political support. The excitement and activities it has generated at the grass roots level are notable - more so in view of the fact they are part of a government-sponsored programme. To find a parallel situation would be difficult not only in India but worldwide.

The utility of channel improvement works, which is the major activity being undertaken by the WUAs and DCs, can scarcely be questioned. It does however raise the question of sustainability of the efforts and the tempo of the programme. Inability to sustain the dynamism and maintain the systems of creation and use of irrigation networks, has been the bane of most top down approaches. How and why the Andhra Pradesh experiment will escape this fate is not entirely clear.

SUPPLY-SIDE INITIATIVE

There are two points to note - one, almost the entire effort is geared to improving the supply-side efficiency - the desilting, construction of lining, drops, pipe outlets, clearing of weeds, strengthening of embankments of channels, etc. Funds for these activities are in fact reaching the WUAs and DCs at the rate of Rs 200 per acre (Rs 100 per acre through WUAs and Rs 100 per acre through DCs). Contractors have been eliminated for minor works (and this is no mean achievement for a government sponsored programme). Physical improvements are in fact being executed. The works are being taken up simultaneously dispersed throughout the state. This has enabled much higher work output in a short span of time. This is in contrast to the earlier situation where the work output was limited, among other things, by the irrigation department's capacity to handle all the jobs concurrently.

As a result of this tremendous effort water wastage due to reduction of conveyance losses has been reduced, increasing the efficiency of water use at a macro level. The increased water availability due to this reduced wastage however, can at best increase the water available for productive use by 15 to 20 per cent. This increase can certainly make the water travel further down the channels - towards the tail end. But it is certainly not sufficient to provide multiple irrigation to tail end areas. For the latter to happen it is absolutely necessary to curtail the amount of water being drawn upstream and divert it downstream. The total quantum of water

is limited in the short run (on the average and with given hardware components). Increased water at the tail can make a significant impact only if it is made available at the cost of upstream farmers, i.e., by controlling their supply. That is, a drastic re-distribution of water needs to happen. How this is envisaged in the overall programme is not clear. To realise this redistribution implies the renunciation by the head end farmers of the disproportionate share of water that they have become accustomed to draw. The lush green paddy fields at the head (of main canal, distributaries and minors) which are over-watered (and very often have lower yields than mid-channel fields) bear testimony to the monopolisation of water by the farmers on the head reaches.

How is PIM in Andhra Pradesh going to effectively ground this redistribution in favour of tail end areas? By control structures? By persuasion and good will? Coercion? Who is going to take the politically unpalatable decision of enforcing this reduction of water to head areas? It is well known that technical structures have been tampered with earlier. Resistance to giving up privileges enjoyed over the years is more likely to be offered and cannot be wished away. Conflict of economic interest is at the hard core of this resistance and farmers are acutely aware of this. The social injustice of head farmers' claim is not an issue of great concern to an individual head-end landowner. From the brief visits to the field areas of Sriram Sagar (SSP) and Nagarjuna Sagar (NSP) Projects, there is evidence of the tail-head issues being discussed in the DC meetings. However, the DC has no executive authority to implement the land-based water distribution agreed to in principle or to take punitive action against those who violate the rules.

Secondly, a major implication of the above (i.e., failure of the tail areas to access significant benefits of increased irrigation) discourages them from paying their water cess (currently at about Rs 200 per acre for wet crops). The revenue collections, which have been traditionally low in most irrigation departments, are bound to continue to be low. This is in spite of the fact that if the irrigation service is satisfactory, farmers do not mind paying the water charges.

The PIM financial strategy was to stimulate revenue collection with higher water charges (recently hiked) by providing better service, such that the WUAs and DCs could be self-financing entities vis-à-vis the M and O works. The Rs 200 per acre financial input matches to Rs 200 per acre revenue collection. If the expected revenue collection is not forthcoming the deficit has to be made up by outside sources.

As of now it is World Bank loans. However, the problem with loans is that they have to be paid back and their flow is time bound. The question is how do we pay back if there is a constant deficit (forget about surplus), and two, what happens when the inflow stops. What happens to all the activity and the excitement generated? The investments in improving the supply network need to be kept up. If funds are not forthcoming for that it will again set into motion the poor revenue-poor M and O-poor collections-poor M and O cycle. And so we are back to square one after the brief spell of heightened expectations and good work.

What then is the alternative? Are we trying to argue against the programme activities? Is it futile? Is it to run down the admittedly useful revamping of the supply channels which was badly required? The argument is for carrying the process of irrigation reforms – which are necessary and inevitable – beyond the narrow confines of a supply-side approach to include the critical realm of end use regulation of water. It is thus to take forward the process, which has been initiated, to logical conclusion by bringing within its purview, the modes of on-farm utilisation of water, the cropping pattern and agricultural practices. The carrot-and-stick strategy (using market and non-market mechanisms) should be used to influence choice of low water consumption crops, water efficient technolo-

gies and adoption of agricultural practices, which enhance water productivity.

There is no dearth of technological options in the country that abide by the above criteria. The idle capacity of research organisation, experts, consultants is waiting to be tapped. What is lacking however is the hesitation to expand the area of PIM reforms to bring water-use within its fold. As of now the AP Farmers Act clearly states that the role of these reforms is to institute rules for equitable distribution of water (on per acre basis). What the farmers do with this water, is their business. It is this aspect that can form the Achilles Heel of the entire programme. If rice cultivation is the only response of water users, the head enders will continue to guzzle the water starving the tail enders of their legitimate due. Any attempt to cut into their water 'right' will be strongly countered. The entire investment at public cost would continue to cater to the privileged few, and further reinforce social and economic inequities.

Increase in area irrigated during the post-reform period has been widely claimed. This is also plausible, given the focus of channel improvement leading to increased efficiency of water transmission. But the extent of area that can be properly irrigated by the water thus released is not well documented. Government records – mainly from revenue department and also from irrigation department – do not clarify the

The job listing should read as follows:

The University of California, Berkeley invites applications for a tenured position in South Asian Studies beginning in the 2000-2001 academic year. Candidates in any social science discipline whose work is committed to the study of contemporary India will be considered. The appointment will be made to the department of the successful applicant's expertise. Capacity and willingness to serve a term at some point in the future as the chair of Berkeley's Center for South Asian Studies also will receive positive consideration. It is expected that an endowed Chair in India Studies will accompany the appointment. Applications with vitae, names of at least three references, and other relevant supporting materials should be sent to **Ms. Gail Stern, South Asia Search Committee, International and Area Studies, 260 Stephens Hall, University of California, Berkeley 94720-2300 by October 31, 1999.** The University of California is an Affirmative Action, Equal Opportunity Employer.

'quality of irrigation' received by this 'increased irrigated acreage'. Water touching the tail – after 15 years – also gets entered as irrigation of tail areas. There could be varying degrees of reliability, pressure, speed of water reaching the tail. How satisfactory and significant this 'irrigation' is for the user is yet to be confirmed. The point is that the increase in area irrigated as a result of PIM tends to overstate the case. Field level data point to less optimistic picture. While quantitative figures/data may sound impressive – the qualitative reality they represent is not explicitly specified. There is need for more detailed and reliable data collection mechanisms before a firm statement can be made regarding the systematic increase in area irrigated – abstracting from seasonal/climatic fluctuations – can be made.

As per the feedback from the field investigations data on area irrigated was primarily the responsibility of the revenue department, since they had to charge and collect the water cess along with land revenue. There was a systematic tendency to under-report the area irrigated. Consequently, less revenue needed to be deposited in the treasury. Water charges were in fact collected from a large area, but found their way into the pockets of the revenue department personnel. The low figures for area irrigated in the years preceding the reforms are absurd and ridiculous in some cases – being less than 10 per cent of the visible irrigated acreage. This is one reason why it is so difficult to get data from the local MRO's office. What has happened after the reforms is the greater pressure on the revenue authorities to enter the area irrigated in official records, as the WUAs expect to get funds for M and O in proportion to the revenue that is collected from within their command. Therefore, a large part of the 'reported' increase could also be due to increased 'reporting' and not necessarily due to actual increase in area. The broader point being made is that the data on increased irrigated acreage needs to be subjected to critical scrutiny by further research before arriving at a definite hypothesis about linking the entire increase in area irrigated with the reform induced activity.

However, limited increase in area irrigated due to channel improvement is possible. This increase would be a quantum jump due to initial work. Subsequently, only incremental increase can be expected. For instance, the desilting of channel, which has been clogged for the last 15 years, is bound to show a dramatic change in water flow. Additional repairs would contribute marginally to the enhanced flow of water. This increased flow is therefore more or less a one time increase in water saving. The possibilities of releasing additional water by reduced wastage en

route would therefore be soon saturated and one would have to look for the more critical mechanism for feeding the tail areas, mentioned earlier. That is, by curtailing the supply of upstream farmers.

Involvement of revenue administration brings us to the second point of concern. Recognition of unreliability of revenue records of irrigated area has led to the proposition of conducting 'joint azmaish' (or assessment) to be conducted by a representative each from revenue department, irrigation department, agricultural department and a member of WUA managing committee. This is definitely a welcome step towards streamlining the system of primary data collection. Although not effectively grounded, as of now – it is a matter of time before it is well established. Currently, there is evidence of higher revenue collections under some distributaries. This again requires cautious interpretation in light of the fact that the water charges in the state have been linked by nearly 100 per cent during the last two years. The increase in revenue collections could be due to higher charges and not necessarily due to larger number of farmers complying with the payment. Here again data is required on the area irrigated for which water fees – at higher rates, has in fact been paid. Disaggregated data analysis is required for positing any hypothesis either way. Hasty over-generalisation is best avoided in the interest of realistic assessment of ground realities.

All the success stories of water management as in Radegaon Sidhi, Pani Pan chayats, were contingent on the social regulation of water use. There are admittedly constraints of a top down approach

that makes micro-regulation of water use rather problematic – something that has been achieved by painfully slow but sustained efforts of NGOs in different pockets. Social transformation however cannot be brought about overnight by government fiat. It is a slow and painstaking process based on sustained grass roots mobilisation. A strong awareness drive is required to carry the community with the programme. These inputs are critical for conflict resolution – which is necessary part of social change. If not resolution, at least containing the conflicts. Top-down approaches, which cut short on these inputs, run headlong into a myriad of social conflicts between different interest groups. Reconciliation among them within a top down paradigm becomes problematic.

However, even within the constraints of the government programme it may be possible to initiate changes in the water use habits of farmers. This may be stimulated by a combination of inputs from agricultural extension and market instruments by making it economically attractive and practically feasible for farmers to switch to low water consumption crops. This requires efforts to transfer technologies on a turnkey basis from the lab to the field through pilot projects, as well as the push to diffuse these technologies. Research into constraints to diffusion needs to be undertaken for formulating a suitable policy. As of now however thinking along these lines is pre-empted due to the self congratulatory mood in Andhra Pradesh and the ensuing hype. The cloud of euphemism obscures clarity of thought and lowers the probability of confronting the post reform contradictions inherent in the programme.

SUNYA FOUNDATION

The Sunya Foundation is a small grant-awarding body, which encourages those who wish to develop – both within and outside formal academic contexts – innovative, reflective and transformative perspectives in the Humanities. Full support will be offered for 4 domestic scholarships and partial support for one scholarship to study in recognised universities in the U.K. or Europe. This applies to citizens of India only. Those interested in applying should write to:

Mr. S. Sivakumar
Sunya Foundation
The Retreat
Shahibag
Ahmedabad 380 004

Election Commission: Separating Basics from Frills

J V Deshpande

In the light of some of its recent actions, there is a strong case for a dispassionate review of the Election Commission's role in the electoral process.

AFTER a strong and adverse reaction from the Supreme Court, the Election Commission withdrew its ban on the publication by the media of the results of opinion polls and exit polls. This is a pity in a way because, by its withdrawal, the EC has once again managed to avoid a thoroughgoing review of its authority. On an earlier occasion also, when Bihar government challenged the directive of the EC making photo-identity cards compulsory for voters, the EC withdrew its order, rather than test its legal validity. In the present case, because some members of the press and television appealed to the courts as the aggrieved parties, the EC was compelled to withdraw its order banning exit polls. At the same time, its other questionable directives, such as banning advertising on television by political parties or prohibiting media persons from accompanying the prime minister on his plane presumably continue because no one has challenged them yet.

In the light of some of the recent pronouncements of the EC, there seems to be a strong case for a dispassionate review of its role in the electoral processes of the country.

For example, it is hard to find any rationale behind its attempts to ban exit polls and opinion surveys. Conclusions based on sample surveys are a standard part of any scientific inquiry, particularly in the social sciences. Such a survey always comes with an estimate of the error and an alert reader bears it in mind while drawing conclusions. It is very likely that there are some 'commissioned' surveys by interested parties where the conclusions are doctored. But just as 'commissioned' news reports or even editorials in some newspapers do not justify censorship of newspapers, similarly a blanket ban on the publication of exit polls does not fit into a democratic set-up. Anyway, in the past, the Indian electorate has amply demonstrated its ability to be discriminating. Even the near-monopolistic conditions of 1977, particularly of the electronic media, did not save the Congress Party from rout.

The justification advanced by the EC in proposing such a ban is even more disturbing than its action. One of the members of the EC opined that by and large the Indian voter is only "half-literate" and can be easily swayed by such publications. Does the EC believe that the Indian voter has no judgment of his own? Even assuming that exit polls and opinion polls are part of the propaganda of some party or other, is it the responsibility of the EC to filter such propaganda? A statement such as this takes one back to the colonial days when learned men discussed in London whether the Indians were fit for provincial autonomy or for Home Rule or whatever. Disturbing as the statement of the EC is, the fact that it has gone unchallenged by all the political parties, which nominally swear by democracy, is even more worrisome.

Equally preposterous was the EC's alibi while banning advertising on television by political parties. The EC felt that "such advertising gives unfair advantage to larger and more resourceful parties" and that there should be a "level playing field". It is of course expected that the EC will discharge its duties impartially, without fear or favour. Does this mean that it is also the duty of the EC to prop up a party that may be weak in material resources? What if a party is weak in manpower? Or in ideology? It is in the nature of things that the electoral process will weed out the weaker, smaller parties. If the EC can ensure that people can vote freely and without fear of reprisals, parties which have lost their relevance, or which have lost the confidence of the public will surely exit and there is nothing to lament in that.

Under the Constitution, the EC is given "control over the preparation of electoral rolls and conduct of all elections". It has to see to it that elections are conducted impartially, and, one may add, expeditiously without any element of fear. According to some reports, everyone who had reached 18 years of age on December 31, should have had his name on the electoral roll by the next March 31. If the EC had adhered to this excellent norm, the

country would have been spared the unhealthy situation of having a government for six months without any Lok Sabha to answer to. Even the rolls, which were eventually made available, had many lacunae. One of the members of the EC found his name missing from the rolls. This author changed his residence in 1995 and in the elections of 1996 found his name in the supplementary list in the new constituency, which is fair enough. But in 1999 also, his name continues to be in the supplement for which there is no excuse.

The photo-identity scheme, mooted about five years back, will go a long way in reducing bogus voting and allied malpractices. One would have expected the EC to complete the distribution of these cards in the past five years. But the scheme seems all but forgotten today. Do the priorities of the EC change with a change in the commissioners? When they were sought to be introduced first, the Supreme Court, reasonably enough, did not want elections to be held up indefinitely till all the identity cards were distributed. But surely, five years was ample time to complete the process throughout the country, including Bihar, where the next state elections are due soon.

Current political trends do suggest that the services of the EC may be needed more and more frequently in the near future. It is therefore high time the EC got its act together.

This can be done if it concentrates on its basic function, of being ready to hold the elections in a fair and impartial manner and at short notice. Much will be gained if it can have the electoral rolls ready and up-to-date, including the issue of identity cards, say at March 31 and October 31 of each year. This will enable it to hold elections at short notice. The EC also has to keep in mind that the guidelines that it may issue from time to time, are just that – guidelines. They will be acceptable only so long as there is a consensus on their utility. Unlike in the UK, conventions and guidelines which are not codified do not carry the force of law in this country. If they are to be accepted as the law of the land, they have to go through the normal legislative process and sooner the EC takes steps to get the necessary legislation on the books the better. It should expect no help on this from political parties. All of them have prospered under the present system and would not, on their own, like to tie themselves down with a new set of rules. But setting its own house in order should be in the hands of the EC, provided it displays the necessary will and urgency.

Official Data on Trade Unions

Some Comments

K R Shyam Sundar

The trade union data published by the labour bureau of the union government are anything, but reliable, deficiencies in registered unions reporting to state governments and states reporting to the centre being the main reason. As a result there is a question mark, for example, over whether or not there has been a secular decline in the degree of unionisation.

THE labour bureau of the union government publishes data collected either statutorily or voluntarily from employers and trade unions on various aspects of industrial relations. Among the data statutorily collected are those on trade unions, collected under the Trade Unions Act, 1926. The importance of data on unions needs no reiteration. Assessment of the quality of official data is a necessary prelude to any serious quantitative analysis of the data. The limitations and strengths of official data need to be brought out to facilitate careful data analysis and the generation of ideas for improving the data.

The basic limitations of data on unions have been noted by several [Johri 1967, Rudolph and Rudolph 1987, Shyam Sundar 1993, Venkata Ratnam 1996, etc]. The deterioration in the quality of data on unions published by the bureau is appalling, even condemnable. It is the resulting frustration that has prompted this piece.

According to the Trade Unions Act, any seven workers or employers can form a union and may register it under the Act. Registration entails certain advantages which non-registered unions do not enjoy. Registered unions are required to submit annual returns (which include details of membership) to the registrar of trade unions. Failure to comply with this provision invites certain punishments as mentioned in the Act. This is the statutory basis of union data collection.

Thus, the official data pertain only to registered unions;¹ no information exists on the extent and nature of the 'non-registered union sector'.² On the basis of the returns submitted by the registered unions, the labour departments of the states and union territories compile data and send reports to the labour bureau; the latter compiles the reports and publishes the data in the *Indian Labour Year Book* (ILYB, a 'quickie' publication) and *Indian Labour Statistics* (ILS), both annual, and *Trade Unions in India* (biennial).

Two sorts of compliances are involved here: the registered unions should submit correct and complete annual returns on

time, and the labour departments of the states should furnish reports to the bureau also on time.

As has been widely noted and officially admitted, not all registered unions submit returns. Of those that do, some submit delayed or discrepant returns. Such returns are left out of the consolidated returns sent to the bureau by the state labour departments (ILS 1982-86, p 217). As a result, the number of unions submitting returns has been far smaller than that of registered unions. Between 1951 and 1975, the proportion of the registered unions submitting returns³ ('response rate') ranged from 34.2 per cent in 1974 to 67.1 per cent in 1964-65 (Table 1).

The blame for the inadequacy of the data could be placed squarely on default by unions. While this limitation continued to besiege the data later, a new dimension was later added to the inadequacy.

Since late 1970s, the already deficient union data plumbed greater depths of low quality, thanks to poor compliance by state labour departments. In most of the years in the 1980s the membership data presented excluded at least 10 states (Table 2). The labour bureau informs us that "some states which do not furnish returns in time are excluded in all-India statistics..." (ILS 1982-86).

Blame defaulting state labour departments. Some states have been persistent defaulters. They include Andhra Pradesh, West Bengal and Bihar (since 1977 or so) and Uttar Pradesh, Madhya Pradesh, Himachal Pradesh and Karnataka (since 1980). The number of registered unions in these states in 1975 (the last blessed year for which satisfactory data are available) was 13,687 and the total membership of the unions which submitted returns was 26.08 lakhs (Table 3). The unions which submitted returns accounted for about half registered unions and 40 per cent of reported membership. These are significant union centres for which we have no information throughout the 1980s. It may be immediately pointed out that as the response rate in these states

may be poor the loss of information on account of their default may not be significant.

At least for 1975, the response rate in these states (excluding West Bengal) was not unsatisfactory (Table 3). Unions in West Bengal have had a very poor record of compliance, especially during the 1970s and later. Is it on ideological grounds or on account of simple inaction? If Maharashtra and Kerala (occasional defaulters) are added to the list of defaulting states, the loss of information would be considerable. The very poor record of data for 1980 and 1982 is due to the non-compliance of these union-bulk states.

The labour bureau introduced a revised method⁴ of calculating the 'response rate' in 1976 (Table 4) in view of such default. Since then the 'response rate' has been the proportion of registered unions submitting returns in the states furnishing returns to the bureau (see ILYB 1991, Table 4.01, footnote 3, p 70). The 'response' in defaulting state is ignored. This method lends the data some respectability. The non-compliance of both unions and states has reduced the validity and affected the reliability of union data, especially data for the 1980s.

In the case of the defaulting states, who should be held responsible? The defaulting unions or the administrative apparatus? If it is the latter, are the state administrations guilty of non-compliance or late compliance? In either case, what are the reasons? What measures has the bureau adopted for remedying the situation?

The labour bureau provides estimates of registered unions for the defaulting states. The estimates are said to be based on the previous year's figures (ILYB 1984: 77). They are revised from time to time, as is shown in the case of Andhra Pradesh and West Bengal (Table 5). The last year for which information pertaining to the former state is available is 1977, when the number of registered unions was 1905. This figure was repeated till 1983, after which it was revised twice, to 2,838 in 1984 and 3,615 in 1987.

On what basis did the bureau revise the estimates? Is it on the basis of late reports sent by the states concerned? Secondly, how reliable are the estimates? While the labour bureau estimated the number of registered unions in West Bengal in 1985 at 8,965, the labour department of the state placed it at 11,225 [Sen 1996: Table 7, p 447]. The bureau's figures seem to understate the reality.

The reportage since the late 1970s, characterised by the abovementioned shortcomings, further reduces the usefulness of union data. The membership data are far from reliable and of limited validity.

especially the data for the 1980s. They are even dubious, as we note later.

This in turn affects the usefulness of a key index: the degree of unionisation (DU), which is the proportion of the 'organisable lot' in a relevant geographical unit which has been unionised. Apart from the deficiencies of the membership data, problems exist in determining the 'organisable lot' the deflator to membership. For example, should the 'organisable lot' include agricultural workers, military and police personnel, government employees and workers in the so-called 'unorganised sector'?

In India, two series of DU are usually presented, one using census data estimated

non-agricultural employment, the other using organised sector employment data put out by the directorate general of employment and training (DGET). The census figure is a broad and unrealistic estimate of the 'organisable lot'. On the other hand, disaggregated analyses have shown that DGET data lead to an 'underestimate' of the organisable lot in the case of some industries. Union membership in these industries is found to be greater than employment [Johri 1967, Deshpande and Deshpande 1989, Ramaswamy 1977].

This leads to the problem of membership identification. The registered unions seem to be making inflated claims of

membership, as Ramaswamy has found in Coimbatore mills, [Ramaswamy 1977]. The membership verification exercises⁵ usually show that the "claimed membership far exceeds the verified figure" [Johri 1967: 27].

To this extent, the unverified membership figure is an overestimation; but this 'plus' is said to compensate for the 'minus' of non-reported membership [Johri 1967]. But the reportage deficiencies noted here would mean that 'minus' side far outweighs the 'plus' side. On the other hand, deflating recent membership data by all-India figures of organised-sector employment would underestimate the DU, as the membership data do not cover all the states.

These deficiencies should make one cautious of using the DU to study trends. The 'secular decline' noted by Bhattacharjee and Chaudhuri (1994b) between 1960 and 1984 may not reflect reality but poor quality of data. The declining response rates, which the duo also note (p 70), could account at least partly for the apparent decline in membership. As CS Venkata Ratnam has suggested though in a different context, the deflator should include employment only in states for which membership data for the relevant years are available.

What is the alternative to the discredited membership figures? The less damaged measure, the number of registered unions? This is statistically more valid but theoretically less meaningful, while for DU the reverse is true. The number of registered unions deflated by either the number of establishments or employment in the organised sector (it could be called 'rate of union formation') could be used as an 'organisational measure' in place of the DU (Table 1).

The poor response rate of registered unions and poor compliance on the part of states reduce the utility of other data such as income and expenditure of unions and classification of unions by industries or sectors. They also tend to make the publication of detailed information in the biennial 'Trade Unions in India' a wasteful proposition. In any case, the considerable time lag in the publication of this volume and the difficulties of access to it makes this source a least used one.

The labour bureau surely owes the users of official data some explanation for the noted deficiencies, replies to queries and assurances that things would improve in future. How long can we put up with incomplete, not quite valid and unreliable union data?

Notes

Notes: (a) Data relate to both workers' and employers' unions.

(b) Till 1964-65, the reporting relates to financial year, since 1966 to calendar year.

(c) Since 1976, this includes estimated figures for states from which the bureau did not receive returns (see Table 2 for further information on this).

(d) See the text for explanations of the indices.

(e) Data not available for 1951-60.

(f) Number of registered unions per one lakh employees in organised sector.

(g) Figures exclude Rajasthan (Indian Labour Year Book 1965).

(h) See Table 3 for further information on response rate.

Sources: I.L.Y.B., various issues, the latest issue being 1991, for union data; Centre for Monitoring Indian Economy (CMIE) for employment in organised sector.

¹ This is not the fault of the data collection agencies. The situation can be remedied only

'core' of the union movement in India (ibid). These unions, according to Bhattacharjee and Chaudhuri (1994b), "approximate the traditional party-affiliated, centralised unions" (p 69). Indeed, the decline in the response rates is seen as part evidence of decline, even stagnation, of such Unions. It is arguable that traditional party-affiliated unions are better equipped with administrative resources and more alive to legal responsibilities than the new plant-specific non-affiliated unions. But the argument cannot be pressed. It cannot, for example, explain the poor response rate of unions in West Bengal.

4 Bhattacharjee and Chaudhuri (1994b) have used for 1980 and 1982 the 'old' method of calculating response rates - that is the number of unions submitting returns as a proportion of the number of registered unions including estimates for states that have not furnished returns. The figures of response rates derived by this method work out lower than those calculated by the new method (Table 4).

In their earlier paper Bhattacharjee and Chaudhuri (1994a), have used response rates to capture the shifts in union structure. If they have used the old method of calculating response rates for the period 1976-86 also, that would raise questions about the validity of their findings. If, as it appears, the non-reportage union data is due mainly to lapses by the administrative apparatuses of states appears, the response rates are not a commentary on the nature of unions. Secondly, the bureau's 'new' method of calculating response rate is more realistic and indicates better activity or inactivity on the part of unions.

5 The problems relating to verification of membership are a separate issue. Controversy over the 'correctness' of verified membership is old hat (see Venkata Ratnam 1996, *Industrial Relations Newsletters*). As noted elsewhere, the labour bureau remains unshaken in its recognition of central federations for data purposes despite altered union scenes [Shyam Sundar 1993:218].

Asia's Women Leaders and Dynastic Charisma

Robi Chakravorti

While dynastic charisma is a factor in the rise of many women leaders, in the case of Sonia Gandhi it is being cleverly articulated in her favour in India's current political vacuum.

THE emergence of Sonia Gandhi as a leading politician raises some interesting questions about contemporary politics and the complex value system and rhetoric influencing it. If we look at the recent emergence of many leading female political figures on a global scale, Asia occupies a special place. Several women leaders have recently emerged in the political field in Asia. If we consider the removal of gender discrimination as a ruling factor in improving political ideology and performance, many Asian intellectuals and political analysts may applaud this development comparing it with western countries. Margaret Thatcher was the first woman prime minister in the UK, but the US is still waiting for a woman president. Elizabeth Dole, wife of senator Bob Dole is running for primaries in the presidential contest, but the chances of her even winning primaries for the presidential contest are dubious. It is interesting to add in this context that two European countries recently elected women as president for the first time – one is Switzerland, an old democracy in Europe, the other Latvia, a tiny ex-Soviet state. Latvia's elected female president, Vaira Vikefreiberga, lived abroad for 55 years, returning to Latvia last year. She was a psychology professor in Canada, and speaks six languages.

Sonia Gandhi in a recent speech stressed the factor of gender discrimination as the source of the criticisms levelled against her. In a speech addressed to the AICC delegates on May 25, she said: "No longer shall we tolerate the negative forces which seek to target the dignity of a woman through calumny and falsehood."

This is a questionable statement. Criticisms about her emergence in the political arena after the assassination of her husband are not based on gender discrimination although some Hindu fundamentalists may nurture this attitude in their criticisms. Her mother-in-law was a prominent political leader. Her foreign-born status is presented as a negative factor for her political standing. Her opponents

will exploit this factor while her supporters will stress her association with the Nehru family conferring on her the current status as a leader of the Congress Party. She did not, one may counter-argue, earn it through extensive political activities in the past.

Criticism of Sonia Gandhi's foreign-born status and her dynasty-based claim of representing Congress Party's ideology can be seen as a cover for a more fundamental question: the real credential of her qualification as a political leader other than her dynastic connection to a famous family.

When we look at the recent emergence of women leaders in Asia we find that the influence they exercised on the public mind was partly related to connections with their fathers and husbands who were victimised by opposing forces. Sri Lanka president Chandrika Bandaranaike Kumaratunge's and Bangladesh prime minister Sheikh Hasina Wajed's fathers were assassinated, Benazir Bhutto's father was executed by the military. Sonia Gandhi like Corazon Aquino of the Philippines belongs to the group whose husbands were assassinated. Burmese opposition leader, Aung San Suu Kyi, under house arrest from 1989 to 1995 fighting the army dictatorship in Burma is the daughter of the slain General Aung San. The father of Megawati Sukarnoputri of Indonesia, now emerging as a political leader, is the daughter of Sukarno, considered to be a kind of founding father who was forcibly dislodged from power by Suharto.

The political history and culture of the countries where these female leaders emerged differ. Lifestyle and suffering levels of the female leaders are also different. But, at the same time, one can argue that part of their appeal on the popular mind stems from the inherited aura of connection with famous, powerful relatives and the sufferings they underwent. One can describe this phenomenon as dynastic charisma.

The concept of charisma was coined by

sociologist Max Weber. He distinguished three types of legitimacy and authority – legal-rational, traditional and charismatic. Legal-rational relates to modern society, traditional to pre-modern society, charismatic rests on leaders claiming extraordinary powers and qualities which do not belong to an ordinary person.

The Weberian concept of charisma was used as an ideal-type separate from modern legal-rational mode and pre-modern traditional mode. These three types of authority systems can be mixed and interdependent. Lewis Coser in his *Masters of Sociological Thought* points this out by citing the case of Hitler whose domination was based on his charisma, but it was supported by legal-rational authority of German law and institutions and references to Germanic Volk tradition forming a major element of his ideology of national socialism.

This is an important point to remember when studying the application of charisma in the modern context using traditional values such as family relationship and legal-rational instruments like electoral campaign set-ups and modern methods of communication. In the American context, the publicity building up the family-centred charisma around the Kennedy family is a recent example of stressing traditional family folklore and using modern modes of publicity. In the US when political campaigns are conducted, campaign advisory experts use modern media techniques to project charismatic images of the presidential candidates. Ronald Reagan's victory in the presidential election is an example of how modern legal-rational methods can be used to build up an appealing aura around the candidate. Several books were published describing how Ronald Reagan performed better than his rivals before television cameras through competent training by experts. Under such conditions, grass roots level of politics is unlikely to succeed unless a serious crisis occurs. Onetime governor of California, Jerry Brown who lived a simple life and tried to fight the presidential election by leading a grass roots style campaign associating with common people and using limited and explicit amount of campaign contribution failed miserably.

One can argue that this type of media-manipulated attempts to build celebrity-based charisma may have limited impact in the sense that they become routinised. One can describe it as a process of celebrification in politics, conferring an aura of virtues which are not necessarily earned. Charisma in the Weberian sense,

however, may occasionally emerge in the political arena amidst crisis. Long-time exile Ayatollah Khomeini's emergence in Iran as political icon leading to the overthrow of Shah's regime is such an example. At the same time, it cannot be separated from folk tradition such as Islamic values.

While Sonia Gandhi's emergence as a political leader can be characterised as an illustration of media-manipulated use of dynastic charisma, compared to other female leaders in Asia, her performance and achievements up to now have been insignificant. The hardships that some of the female leaders suffered are also different. Benazir Bhutto and Megawati led sheltered lives while Aung San Suu Kyi has suffered. Chandrika Bandaranaike Kumaratunga of Sri Lanka is facing well-established terroristic Tamil movement which constantly threatens her life like her father's. Another point of difference between Sonia Gandhi and other female leaders is the generational claim of power on the basis of family relationship. She is the third generation and fourth person in succession in the Nehru family claiming political status and power. On the other hand, two acts of assassination had hit the family triggering off widespread public sympathy.

Janet Jagan is the wife of Cheddi Jagan, prominent leader of Guyana of Indian descent, who suffered a great deal including imprisonment and harassment. I interviewed him in the presence of Janet in 1968 during Indira Gandhi's visit to Guyana. Janet is white American. They were married in America during Cheddi Jagan's visit to America as a student. Cheddi Jagan is dead. Janet Jagan became president of Guyana last year.

Before coming to power, she along with her husband underwent a long period of struggle and political experience. Last year *Manchester Guardian* published a long article on Janet Jagan written by Pauline Melville. Janet Jagan was asked if there is a parallel between herself and Sonia Gandhi in terms of dynastic politics. "Absolutely not", she replied, "I have had a long political career of my own."

This is true. Unlike Sonia Gandhi, Janet Jagan had played numerous active political roles which her husband, Cheddi Jagan summarised in a short sentence in his book *The Weston Trial: My Fight For Guyana's Freedom* - "At one and the same time, she combined three jobs - housewife, party secretary and minister." She had held ministerial portfolios of labour, health and housing. She was, also, named deputy

speaker once. Compared to her, Sonia Gandhi's role until after her husband's assassination was basically that of a housewife of a prominent politician.

Janet Jagan also faced protest movements against her political status. Its nature and history are, however, different. It is influenced by the ethnic conflict and rivalry between Guyanese of Indian and African descent which were accelerated by a long history of economic and political divisions developed in the context of

Britain's policies in its only colony in South America.

This article is not meant as criticism of Sonia Gandhi. It points out the limitations of her real credentials for claiming superior power in politics. In spite of these limitations Sonia Gandhi may continue to derive support considering the leadership vacuum in contemporary Indian politics and the emergence of Hindu fundamentalism which threatens the secular, liberal and socialist trends.

MALAYSIA

Ninth General Elections Limited Challenge of an Alternative

Vejai Balasubramaniam

With Party Islam Malaysia and Parti Keadilan, separately targeting Malay votes, and Democratic Action Party aiming for non-Malay votes, the resultant split in opposition vote will enable the ruling coalition of 13 parties led by Mahathir's UMNO to sail through the forthcoming general election despite some recent political hiccups.

JALUR GEMILANG's successful solo circumnavigation of the earth helped raise national prestige but not enough for the national political elite to call for early general elections. The term of the present government expires in May 2000. However, prime minister Mahathir Mohamad reminded citizens and all concerned with the country's affairs of his intention not "to please certain quarters" putting a damper on those eager to assess his government's popularity. The economic and political problems resulting from the Asian financial crisis has posed a test for Mahathir's leadership. But this is not the first time his administration finds itself facing an important political challenge.

The first formidable challenge took place in 1990 when Tengku Razaleigh Hamzah (popularly known as 'Ku Li') jostled unsuccessfully to replace Mahathir as president of the United Malays National Organisation (UMNO), the leading member of the ruling 'Barisan Nasional' (BN, National Front - a coalition of 13 political parties). This challenge which culminated in a split in UMNO as supporters of Ku Li left the party to form 'Semangat 46' (The Spirit of 1946), saw both parties competing for Malay political support in the 1990 general elections.

Although UMNO managed to remain the more attractive of the two, the cam-

paign was bitter with both, particularly UMNO, packaging themselves as protectors of Malay interests. Semangat's supporters tend to be overwhelmingly concentrated in northern state of Kelantan, from where Ku Li hails. Following a eight-year stint in the opposition Semangat was dissolved and its supporters including Ku Li joined UMNO "in the interest of Malay unity".

This 'unity' which appears to be threatened following the sacking of Anwar Ibrahim as deputy president of UMNO in September 1997 has also created a vacuum of sorts which Ku Li, among others, hope to fill. But, while the basis of the 1990 challenge was political, directed against the alleged authoritarian and Machiavellian style of Mahathir, that of the present can be attributed to the economic recession which set in late 1997 and is readily the 'deepest' since independence.

But while it is unlikely that the opposition will be able to unseat the BN from power, it could nevertheless lead to an eroding of the coalition's majority in the 'Dewan Rakyat' (the lower house of parliament); and concern over this among other things has caused the government to embark on a campaign to rebuild its image. At issue here is the possible weakening of UMNO's electoral support among the Malays as its claim as protector of

Malay interests appears to be challenged.

Since the May 1969 racial riots, the tacit function of successive government's (and they have all been UMNO-led governments) had as their objective the socio-economic advancement of the Malays. Officially formulated as the new economic policy (NEP), Malays were accorded preferential treatment in government employment, education, and in the economy. In three decades, the NEP has helped expand the ranks of the middle class and the Malay composition in it, as well as create a national bourgeoisie with close links with the government.

Following the drastic reduction in the value of the ringgit against the greenback as a result of Asian financial crisis in September 1997, share prices of companies listed in the KLSE plunged resulting in many of them unable to service their loans. The effort to 'rescue' some of these corporations by the government through the National Economic Action Council (NEAC), via, 'Danamodal' and 'Danaharta' was perceived as saving businesses closely linked to the Mahathir administration. The prime minister, on the other hand, rationalised the policy to save jobs, tax revenue, reviving the economy and protecting Malaysian-owned companies.

In this respect, the opposition by Anwar Ibrahim, the vice-president of UMNO and Mahathir's heir apparent, is noteworthy. As finance minister, his role in the disbursement of funds under the rescue package is critical, inclined as he was towards the language of IMF which propagates transparency, efficiency and accountability among other things. In this light, his sacking from the cabinet and UMNO supreme council on September 2, amidst charges of sexual misconduct, corruption and abuse of power (by using his office to cover up the former) infuriated his supporters and those sympathetic to the dream of an 'Asian Renaissance' – whatever that may mean.

Taking to the streets, Kuala Lumpur, with scenes comparable (all but in magnitude) to those in Jakarta which culminated in the transfer of power from Suharto to Habibie, became the foci of protests by Anwar's supporters in the party and students. Students in the public universities and institutions of higher education in the main had their political voice circumscribed by the universities and colleges act as reflected by their loose organisations. In this context, it became possible for the better organised Party Islam Malaysia (PAS) to play a leading role in the demand for greater political space.

The PAS, which is well known for its opposition to the federal government's modernisation policies which it sees as contributing to decadence, materialism, westernisation, and religious values, has support base mainly confined to the northern states of Perlis, Kelantan and Trengganu. In order to make any significant change in policies at the national level it is imperative the party win more seats at the federal level, and it is in this context that the party rallied behind supporters of Anwar now urging for greater liberalisation, democracy and accountability.

This notwithstanding, the party however has not been able to realise its aim of leading the opposition. This stems from the fact that its more 'traditional' interpretation of Islam and plans to introduce the 'hudud' is not shared by all Muslims, particularly those in the more modern western Malay states. Herein lies the reason for the formation of 'Parti Keadilan' under the leadership of the wife of Anwar Ibrahim, Datin Wan Azizah, by Anwar's supporters in UMNO.

For the exigencies of the 'coming' elections, both PAS and Keadilan appear to be working together though the nature of the political arrangement is quite unclear. Joining Keadilan and PAS in the opposition front is the Democratic Action Party (DAP). While the former parties intended to appeal to the Malay population, the DAP, on the other hand, hopes to garner the support of the non-Malays resorting to its staple such as citizenship rights and equality. The objective of this opposition combine is to deny the BN the two-thirds majority in parliament thus weakening its legislative capability. Yet, the means by which opposition have gone about achieving this end has only contributed to greater polarisation.

In the attempt to win Malay support, PAS and Keadilan have sought to package themselves as alternatives to UMNO. The absence of a clear working arrangement would also result in their vying to contest in the same constituencies, splitting votes and if anything contributing to the victory of BN candidates. The attempt to appeal to voters in Sabah for example too has seen Keadilan raising regional sentiments. DAP, on the other hand, seeks to package itself as spokesperson of the non-Malays and here the party seeks to strengthen its appeal principally among ethnic Chinese voters. While it cannot be denied that regional and ethnic based issues still give rise for concern, they have to be contextualised in wider economic and

political issues affecting the country.

The recently concluded elections in the east Malaysian state of Sabah, where UMNO had won in all the constituencies it contested, saw the defeat of the Sabah centred Party Bersatu Sabah (PBS, Sabah United Party) and victory of the state BN. Taking this as a barometer of its popularity, the national political elite attributed the street demonstration in Kuala Lumpur against them as the handiwork of 'fringe elements', sparking among other things a national 'intellectual' debate on the 'poor' academic performance of 'Malay' students. To manage student political consciousness, by bringing them back to the classroom, as it were, the government's hand was strengthened by its control of scholarships and grants.

While the extent to which this has helped to stabilise politics is uncertain. But the government's handling of the economic recession, particularly its policy of fixing the rate of exchange between the ringgit and the US dollar and the Keynesian type economic policy adopted in 1998, have won it kudos and appear to have stabilised economy. Though the strategy of not to seek funds from the International Monetary Fund have placed the national political elite in good stead in determining economic policy, it will nevertheless at some point have to come to terms with the demands of globalisation. In fact, this can already discerned in measures to reform the country's financial institutions and in policies relating to the Kuala Lumpur stock exchange.

Complimenting the above is the role of radio, television and the mainstream media which by and large are pro-establishment to present Malaysia as a sea of calm. Images and reports of turmoil and images of ethnic and religious strike in the former Yugoslavia, Turkey and Indonesia, help drive home the message of ethnic co-operation.

In this respect the, BN government in general and the Mahathir administration in particular, is able to package itself as working towards unity and political and economic stability. This fact together with the absence of a charismatic leader in the opposition contrasts the present struggle with that of 1990. Yet, while all these is expected to augur well for the BN, the opposition's claim of releasing secret files implicating Malay leaders in the government for corruption will undoubtedly affect UMNO's attractiveness. The extent to which this will influence the BN's majority in parliament, however, remains to be seen.

Globalisation: A Stock-Taking

Manu Shroff

The implications of globalisation for national and international policies are far-reaching and we need to refine our understanding of them. It is time to take stock of developments on the ground as also in the thinking about them.

I PROPOSE to define globalisation, describe its origins and scope, and assess its benefits. I shall then go on to deal with some of the doubts and misgivings about globalisation. The underlying theme of my remarks is that globalisation is only a process and not an objective. The latter has to be defined, somewhat ambitiously, as a global economic and political order. The implications of this for national and international policies are far-reaching and we need to refine our understanding of them. The issues are wider than economics and embrace social, political and cultural aspects as well. I shall only touch on some of these, concentrating on matters economic.

GLOBALISATION AS A PROCESS

It is important first of all to recognise that when we talk about globalisation, we refer to a process and not a state of being. It is a move or a series of moves towards what may be described as a global economy. The world is moving towards it but is not there yet. The moves are not merely to be understood as conscious efforts by individuals, businesses or governments. These are often responses to impersonal forces of markets and technology rather than originators of what is best seen as a move away from national economies interacting with each other in a variety of ways, towards a fully integrated world economy. It is somewhat ironical that while it is not difficult to define the elements of the process of globalisation (and they keep surfacing in the several discussions of the subject), a clear vision of what one means by a 'global economy' does not exist. Since globalisation is presumably a process of moving away from something that is less desirable to a goal which is more satisfactory, it is best for me to start with our disappointments before coming to our aspirations.

Nineteenth century capitalism is often referred to as the nearest we have to a global economy. Not just capital but labour

too was mobile, international trade was free, national economies were kept in kilter by the operation of the gold standard. The prevalence of free markets and a relatively unfettered price mechanism helped achieve efficient allocation of world resources. While politically, nation states retained full sovereignty, they consciously or implicitly accepted rules of the game which abridged their sovereignty in the larger interests of the global economy. There were deficiencies of the system in practice, but the idealised picture of it has endured.

We, of course, abstract from the fact that the world as it was then comprised mainly Europe and America. The colonies of the imperial powers were joined to the world economy less by market forces than by the fiat of the imperial governments. But allowing for this very major exception, the nineteenth century model may be considered to have several advantages over what followed after the first world war. That as we know was the assertion of economic nationalism even when it tended to hurt the world economy or even the limited national interests of some countries. The collapse of the gold standard, the Great Depression and the pursuit of beggar-my-neighbour policies in the form of trade restrictions and competitive exchange rate depreciations, all these were de-globalising trends, so to say, and it took the second world war and more than a quarter of a century thereafter for a reversal of the trends, propelled by technological change and the information revolution.

Theory followed events. The Keynesian revolution underpinned the role of the state in correcting the deficient outcomes of the free-play of market forces and asserted the autonomy of national economic policies. It provided a powerful theoretical argument for what may now appear as anti-globalisation policies. It may sound ironical that Keynes who had an international outlook and was a key figure in the fashioning of the post-war

multilateral institutions was nevertheless a nationalist first.

The second world war inevitably gave impetus to fairly extensive intervention by the state in economic life, and following Keynes, post-war economies in industrial countries, beginning with Britain, were guided by the objective of full employment to be attained by active demand management policies by governments. True, there was also emergence of international economic co-operation, the principle of multilateralism and the most-favoured nation treatment in trade and so on. The IMF, the World Bank and the GATT became the guardians of multilateralism. Nevertheless, the underlying philosophy was still one of nation states negotiating with one another. I recall that even in the early fifties, Karl Manning at the LSE made a distinction between international order and a world order. In the immediate post-war years, we saw efforts to establish an international economic order; but not yet a world economic regime. I like to think that what we call globalisation is a process of moving away from the 'international' economic order to what might be called a 'global' economic (and political) order. And it shall be my endeavour to define this global order and consider the impact of movement towards it on national welfare keeping in mind the different circumstances in which nations of the world are placed.

Quite early in the second half of the 20th century, the problems of developing countries (the so-called third world) came to be differentiated from those of the industrial nations. A whole corpus of theories sought to define and deal with development issues. Development economics came to be seen as a separate and distinct branch of economics. Most developing countries followed a model of development in which the state played an active role and some of them also chose policies which resulted in closing their economies to the rest of the world. But experience over the years and the successes of others who chose to keep their doors open persuaded them to change track and move towards greater openness. Technological change, the information revolution and the dramatic change in the global political environment following the collapse of the Soviet Union contributed in greater or smaller measure to the progressive integration of the world economy in the decade of the nineties.

It is in this background that a few questions arise. One, is the globalisation process driven by markets and technology or is it the result of conscious decisions of the countries of the world? Two, does it involve integration of the markets for products, some services and capital alone or are other factors of production also part of the process – in particular, skilled and unskilled labour? To the extent that there are strong elements of monopoly and monopsony in some of the markets, what can be done to capture the benefits of globalisation equitably for all nations? Does globalisation affect only economic life or is it pervading political and cultural spheres as well and with what consequences? In short, the questions are about the forces governing globalisation, its scope and the nature and spread of its benefits. Finally, we also need to visualise the kind of global order to which the process of globalisation is leading.

ORIGIN AND SCOPE

Origin: Globalisation has not suddenly descended on the world. It is part of a process of progressive integration of the world economy through falling barriers to trade and exchange and greater mobility of capital. But in the last decade or so these forces have got a tremendous impetus from the massive changes in communication and information technology. Manufacturing has also undergone a revolutionary change: the importance of traditional raw materials emanating from developing countries has declined and that of knowledge-based services greatly increased. Design, for instance, is more important in the manufacture of an automobile than materials. Similarly in garments and electronic goods. The share of manufacturing in the GNP has declined in most countries and that of the services sector has gone up. In part, this reflects also the enormous growth of financial services; but mainly it is the consequence of the spectacular advances in computerisation and the associated software.

These developments have also changed the nature of world trade. Gone are the days when industrial countries imported raw materials from the developing nations and returned manufactured goods to them. The present-day multinationals choose to locate their plants nearer the sources of cheap materials or labour or markets, not nationally but globally. A manufacturing corporation will have plants located in different parts of the world making components for the product it makes and,

increasingly, parts and components even for its competitors' products. A growing proportion of international trade comprises trade between different branches and subsidiaries of multinationals. It is no longer possible to identify the origin of a product by the place of its final manufacture. Thus a Japanese car may be made in the UK, but it is still Japanese because of the brand name of the corporation which co-ordinates the entire enterprise. The play of market forces has led to efficiency in the manufacturing process, in location, design and marketing. Technology has been a prime mover in this development, but the *freedom of market* has been even more important.

A good example of how freedom from regulation can bring about unexpected development of new products and markets is provided by the emergence of the Eurodollar market in the late sixties and early seventies. Initially, Eurodollar deposits in the post-war period originated with the USSR wanting to hold dollars which were not subject to the US government controls. (Their dollar holdings had been impounded during the war.) But the big push in the Eurodollar deposits came following the Regulation Q of the Federal Reserve System in the US which put a ceiling on bank deposit interest rates. One domestic consequence of this was that the banks competed among themselves by offering attractive gifts to attract deposits. But internationally, dollar deposits moved offshore to London and other European centres in search of better rates. The US interest equalisation tax and controls on bank lending abroad as well as foreign investments added to the attractiveness of the Eurodollar market. The market expanded at a phenomenal rate in the unregulated environment abroad and although the original causes – the Regulation Q and exchange controls – were later removed, the offshore market continued to grow, as Milton Friedman has so lucidly explained ('Eurodollar Market: Some First Principles', *Morgen Guaranty Survey*, October 1969), through the mechanism of credit creation. I refer to this only as an illustration of the potency of freely functioning markets. No one regrets the consequent enormous growth in international liquidity in the seventies and eighties which, aided by the communication revolution and the freedom of exchange rates, met the expanding needs of the growing international trade. It is only when freedom led to excesses (e.g. over-trading by a fund manager of Baring Brothers leading to a major crisis for the bank or more recently, but for different

reasons, the Asian financial upheaval), that doubts began to arise and the need for regulation, not national but international, began to be felt. But of this a little later.

I believe that market forces and technological change have been far more important in the process of globalisation than conscious decisions of governments. There has been no UN resolution on the need for globalisation! True, the opening up of trade has been a matter of bilateral and multilateral negotiations. Similarly restraints on capital movements have been sought to be removed by inter-governmental efforts. Also, the movement towards an integrated Europe has been inspired by governmental vision and efforts. But more often than not, official action has sprung from the pressure of market forces and technological change. Globalisation has occurred despite governments and sometimes in the face of active contrary actions of governments. It is a force by itself, difficult to regulate or control.

Scope: As of now, the scope for globalisation does not go beyond the markets for products and some services and the market for capital. When it comes to labour, however, the forces of globalisation are not allowed free play, and conscious and explicit state intervention prevents the emergence of a global market for labour. There are many reasons for this. Labour is not just a factor of production. It is also the recipient of the economic, political and cultural benefits of being part of a society. Social habits and customs differ; and so does the colour of the skin. It is not easy for any society to overcome age-old prejudices. The most important reason impeding freer movement of labour, however, is the desire on the part of the rich countries to preserve their standard of living which breeds restrictions on immigration – a very shortsighted policy. In theory, one could argue that free trade in products should bring about an equalisation of prices of products as well as factors of production. The famous factor-price equalisation theorem asserted this – of course, like all such theorems, under assumptions which do not obtain in practice. No wonder that despite freer trade, factor prices have not tended to equalise across nations. It was believed free trade in goods would in general suffice and there was no need for freedom of movement of factors of production. Ironically, however, this applied only to labour. Freer international mobility of capital became an article of faith with most free market economies and economists since the

seventies until the Asian crisis which has brought some rethinking.

Mobility of capital has been a major element in the globalisation process. But the failure of the world community to recognise the benefits to the world economy of freer movement of skilled and unskilled labour is one of the patent contradictions of globalisation. In all probability, secular economic growth in some of the industrialised countries themselves could be stepped up if they could enjoy greater elasticity in the supply of labour. Even so, immigration restrictions have continued, reflecting the cultural divide among nations and the play of tradition, not to speak of the pressure of organised trade unions, a potent monopolistic force in the way of globalisation. In multilateral trade negotiation, the developed countries have pressed for inclusion of services, but what they have in mind are *enterprises* providing services, such as banking or insurance or hotelling, but not the services of skilled or unskilled labour as such. This dichotomy in their position cannot be sustained for long if the benefits of globalisation are to be maximised and to accrue equitably across the globe.

BENEFITS: THE INDIAN EXPERIENCE

There can be little dispute that globalisation promotes competitive efficiency in general. As the area of competition expands, the efficiency gains increase. Enterprises in developing countries, many of which have grown under heavy protection, may find the going tough in the initial phase of globalisation, but as time goes by they begin to adjust, not without pain, but also with a prospect of future benefits. In India, globalisation has meant that corporations plan their strategies keeping in mind the global and not merely the domestic market, whether it is product design, choice of technology, means of finance or opportunities for collaborations and strategic alliances. The benefits of these for corporate growth, modernisation, consumer satisfaction and reduction in costs are beginning to be visible – eg, in the electronic and durable consumer goods sector – after nearly a decade of liberalisation. But there are also limitations arising from the structure of markets and the prevalence of monopoly or monopsony.

The so-called Bombay group has complained that multinationals with their global clout have an unfair advantage over Indian companies and are gradually taking over control of the joint ventures in which they have been partners with a minority

holding. The technological advantage of joint ventures is also getting eroded with foreign partners setting up new 100 per cent subsidiaries for the purpose of expansion based on new research and development, leaving the erstwhile Indian partners in the cold. In mergers and acquisitions too the foreign investors have a financial and managerial edge. Is globalisation meant, it is being asked, to reduce Indian entrepreneurs to the position of minority shareholders or traders? Is this the reward they get for assiduously building up Indian industry, even if it was under heavy protection? The questions are legitimate even if the answers which the protagonists of this view give are not valid without substantial qualifications. In several instances of the so-called de-Indianisation, it is the domestic partner who has taken the lead, lured by the attractive price at which the holding could be sold. Not all joint ventures have seen Indian partners active and prepared to take on their foreign collaborators whenever the interests of the latter are sought to be given precedence over those of the venture as a whole. (Incidentally, overseas companies taking over domestic enterprises is becoming a global phenomenon. In the US, for instance, one-third of all takeovers in the last few months was by foreign companies.)

The demand for a level playing field is at bottom of an argument for state intervention. But once a foreign company has gained entry, it no longer remains foreign. It is governed by the same laws and policies as Indian companies. State intervention can be justified when it can be established that the foreign enterprise (as, even an Indian enterprise) enjoys monopolistic power which distorts the market, though size per se may not be a sufficient reason for intervention. More important is to remove distortions in pricing and other policies which operate to the detriment of the domestic producer. An example of the former is the often one-sided nature of the joint venture agreement which gives undue advantage to the foreign investor, arising from the hold he has over technology or the market. An example of the latter is the compulsions of fiscal policy and foreign exchange management which cause the cost of capital for Indian enterprise to be higher than that for the foreigner. Against these must be weighed the innate advantage which the domestic industrialist has of operating in a known environment and being able, at least in a few cases, of influencing government decision in his favour. The multinational's advantage of size is more apparent than real. Within its

own confines, there is strong competition between different divisions or territorial branches for resources and it cannot be said that its Indian arm has unlimited access to parental resources of a kind as to give a substantial unfair advantage over the Indian rival. Of course, in a conflict situation the parental power can be wielded. But this does not happen too readily, as was demonstrated in the case of ITC. The picture of an all-powerful multinational out to raze Indian industry to the ground is clearly overdrawn.

Nor is it true that multinationals have made inordinate profits and drained resources from India. Traditionally, they have reinvested their profits in business expansion, partly as a result of exchange controls. But even in the freer regime, there is little evidence of net outflow of resources as a result of the operations of multinationals. Indeed, some of them have miscalculated market demand and suffered losses in the consumer goods sector.

The policy implication of some of the doubts about globalisation to which I have just referred to is not that government should take measures to counter the free flow of foreign direct investment but that it must give a breathing space for industry by carefully calibrating the progress towards full freedom for foreign investment. This involves transparent guidelines for takeovers, implicit or explicit governmental help in securing technology transfer and a whole host of reforms in the corporate sector aiming at good corporate governance. It is by asserting our strengths rather than harping on perceived weaknesses that industry should robustly face the challenge of globalisation. Also, a pragmatic approach is needed in preference to doctrinaire pursuits in order to maximise the benefits for the Indian economy.

The episode concerning the entry of Enron in the power sector provides a good illustration of this. I shall not recount the story of Enron as it is well known. But the initial doubts were resolved through negotiations and the participation in equity by the MSEB ensured that some of the financial gains from the investment accrue to the public. The crisis was caused by doctrinaire politicking; it was resolved by assiduous negotiations with a pragmatic approach on the part of both sides. I am not saying that the controversy will not be revived (one hopes not), but it is a signal fact that the benefits of the project have already begun to flow and Maharashtra, it is reported, is no longer a power deficit state.

It may be argued that while foreign direct investment is beneficial, freedom for portfolio investment tends to destabilise the economy. Here again a sense of proportion is needed. We can scarcely take advantage of the information and communication revolution if we shut ourselves from the financial markets of the world. Portfolio investments have resulted in a net positive inflow so far. There is little evidence that they have been a major cause of such volatility as has been observed in the stock markets from time to time. Much of the institutional reform in the secondary markets, e.g., dematerialisation of securities and speedier and more secure payment and settlement system was in all probability expedited by the FII pressures. The advantage that Indian companies have derived by being able to float issues in foreign markets has sprung from the policy of openness to capital flows from abroad.

Globalisation has the potential to bring a veritable revolution in communications in India. Imagine where we would be today if the telecom policy had not been caught in the web of confusion and narrow politicking! And the potential of the Internet for greater productive efficiency, cost reduction and access to new ideas has yet to be exploited. (I do not wish to overstate the impact of computerisation on the growth in productivity. Recent studies of the US economy suggest that the impact is not significant since computerisation results mainly in the substitution of one form of capital by another. But the experience in a developing country may turn out to be different, for no other reason than that it may be an inducement for modernisation.) All in all, whether in the real sectors or the financial, globalisation is helpful to the Indian economy. It has been growth-oriented and has inspired technocrats to spawn vigorous new enterprises in fields such as software and consumer goods which are also employment intensive.

BENEFITS AND DOUBTS: GLOBAL EXPERIENCE

Why is it then that doubts still persist? And not merely in India but, one should say, globally? The recent *Human Development Report* of the UNDP gives expression to some of these doubts. Basically, the issue is about equity. The report cites data to show that the benefits of globalisation have not spread evenly among the nations and within each country. It has tended to worsen inequalities of income. Newer kinds of inequalities have emerged, e.g., between those who are

'connected' and those who are left out of the web. (Incidentally, on this criterion, many of us will fall in the category of the deprived!)

Greater connectedness also means faster transmission of ideas and skills, good and bad. Thus the spread of crime and terrorism or diseases or quicker transmission of economic recessions or financial volatility and global unrest generally are sought to be blamed on globalisation. There is also complaint that cultural invasion from abroad is a threat to the survival of national traditions and values. There is some substance in all this. But the report tends to overdraw the picture. For instance, it is simply not true that the cultural flow is all one way and that it represent an invasion. Similarly, new technologies may have given new wings to crime; but so has it to the policeman. Nevertheless, it is true that when one opens the windows one gets fresh air as well as insects and mosquitoes. The answer is not to shut the window, but maybe to put a screen or install an insect repellent. In other words, we must improve our understanding of the national and international policies needed to tackle the possible adverse impact of globalisation. Let me illustrate this by reference to the concerns about equity and financial stability. I shall begin with equity.

POLICIES

National Policies

There is evidence that inequalities of income have increased in the richer countries and that poverty persists in the developing world. But it is not established that these are the consequences of greater market orientation or globalisation. At the national level, we have grappled with poverty removal ever since Independence and our experience suggests that rapid growth is a necessary condition for success. To the extent that globalisation, structural adjustment and economic reforms in general help the growth process they are also an essential adjunct to poverty removal. In this sense globalisation is not antithetical to reduction in the numbers of the poor or greater opportunities for the deprived. We have also learnt that selective state intervention is also necessary to directly deal with the problem. Over the years we have lapsed into a dualistic society. For some goods there is dual pricing, e.g., the public distribution system. For others, there is in practice a segmentation of investments and facilities. The children of the poor go to municipal schools, those of the well-to-do choose private and missionary schools. State

transport is largely for the poor; private buses, or the so-called luxury buses, for others, and so on. Similarly in health and education. The market system for the rich and the middle classes, public investment support for the poor. It is a messy sort of dualism, since public outlays are notoriously inefficient and leaky; and there are distortions of priorities as well. No wonder such interventions have proved costly. What then is the answer?

I would reiterate that nothing we try to do to remove poverty can succeed without rapid and efficient growth. A little more controversial proposition is that we must learn to live with some degree of inequality if that is necessary for the incentive structure required for rapid growth. It follows that we should do nothing to stop the globalisation process, but rather redesign the anti-poverty programmes to make them more effective than they have been so far. Better targeting and greater participation by the beneficiaries, directly or through well chosen NGOs are also required. Of prime importance is the literacy programmes. No country with a poor literacy has recorded sustained high growth. This lesson has yet to be learnt by the Indian policy-makers.

As for financial stability, again, what is needed is reform of institutions and an effective regulatory system. Market failure is endemic in the financial sector, given incomplete information and incomplete markets. A sound institutional base has to be established. Since this takes time, there is case for direct intervention in the form of capital controls, particularly in the external sector of the economy. India was not severely affected by the Asian crisis partly because we had not opened up fully and partly due to the ongoing financial sector reform process. To a large extent the problem of financial volatility has to be tackled also by international measures. The argument is not that globalisation should be stopped. Rather we should develop a vibrant financial system to reap fully the benefits of globalisation.

Global Policies

Coming now to global policies to tackle the adverse impact of globalisation, I shall refer again to equity and financial stability. The distribution of world income and the enjoyment of world resources are notoriously unequal. Even more important is the clout exercised by the rich nations in world fora. The problem is in the main political. Greater voice for the poor countries in the international organisations has been an ongoing demand of these countries. The foreign aid route is still

alive but not quite kicking. For the poorest countries of the world, especially in Africa, there is little respite from dependence on aid from abroad and, in the case of those with poor or no governance, from the persistence of poverty and inequalities. Globalisation, it seems, may tend to counter some of these inequalities, by the freer flow of capital and technology and the concomitant pressures of interested lobbies favouring host countries. US firms in India for instance are the best spokesmen for India on Capitol Hill.

It must be noted, however, that in the matter of technology and R and D, there is a clear danger of market failure and thus need for intervention by a public agency. R and D which is market driven does not address the problems of the poorer countries, as is so vividly brought out in a recent article by Jeffrey Sachs in *The Economist* (August 14-20, 1999). The whole issue of intellectual property rights particularly in matters having a bearing on public health, genetics and biodiversity, has to be considered in the light of market failures arising from inequalities of incomes and the prevalence of monopoly. The view may be gaining ground that too strict a regime for intellectual property rights may tend towards "privatising public knowledge, thereby creating incentives for misdirecting intellectual energies" (Joseph Stiglitz, Wider Lecture 2, January 1998).

Freer flow of labour will be a powerful force to reduce inequalities. This should have a high priority in any global exercise for equity. No more than a tenth of the unemployment in the industrial countries, according to the UNDP Report, can be attributed to the growing links of these countries with developing countries. Their protectionist attitudes in respect of imports from the so-called low wage countries or even in regard to immigration policies thus appear to have little justification.

The question of financial instability is already on the agenda of global debate about a new financial architecture in the wake of the Asian crisis of the previous two years. That crisis has taught a few lessons to the world community and has provoked fresh thinking about the so-called Washington Consensus. There is greater readiness now to live with some restrictions on capital flows and greater emphasis on an effective regulatory framework within nations and also internationally. The issues are about the mechanisms to deal with private debt crisis, confidence building to restore capital flows after they are disrupted, the need and modality of a lender

of last resort, better information and warning signals, etc. The framework, however, is international, not global. Thus there is no proposal, for instance, of a global central bank. Keynes in his international 'avatar' had proposed a world central bank and a world currency to be called 'hancor'. In the absence of a global vision on the part of the international community, we are nowhere near this and have to be content with SDRs! The paradigm is still that of policy co-ordination.

The underlying truth in all this to my mind is that so long as we remain in the mindset of internationalism, we will not have the ability to tackle the outcomes of globalisation which are no longer within the control of national governments. By internationalism, I mean the framework in which nation states, jealous of their sovereignty, negotiate with each other on global issues with a perspective of maximising national gains and yielding the minimum of their freedom of action. The globalisation process, as it gains momentum, is likely to erode the strength of this framework and must eventually end in a global order. But this is still a far cry.

GLOBAL ORDER

Ideally one should be talking about a global state. Such a state will have its own security force, its own budget and taxing power (taxation of fossil fuels, foreign exchange transactions, etc, have been suggested from time to time), its own mechanisms for financing public goods, its central bank, its communication network and the various development departments which one is familiar with in the national context. There are quite a few of these in existence now covering food and agriculture, industry, labour, energy, environment, health, children's education, civil aviation, post and telecommunications systems, and so on. But they are mostly operating within the 'international' mode. The nation state survives with a vengeance. There is reluctance to part with sovereignty in the interest of larger global good. This also compounds the intricate problems of global environment, whether it is climate, emissions or the global commons. True, the UN and its various arms are manned by an international civil service. But that it is not so in practice is well known. (A distinguished civil servant from India once admonished the staff of IMF/World Bank by saying that they had to be international, to be of service and above all civil!) Quite apart from the persistence of national spirit in the international organisations, their working is also hampered at times by the compulsions of geopolitics which

continues to govern the foreign policy goals of major powers. Political and military power will inevitably be unequally distributed. But this inequality gets translated into other fields of international co-operation and tends to negate the benefits of such co-operation.

In this background, the establishment of truly global institutions will not be an easy task. Perhaps the route to them will lie through the operation of two quite distinct and contrary forces. The growing strength and spread of technology and free markets may well diminish the powers of the nation state, but this is by no means certain. As Meghnad Desai has stated, "The big debate about globalisation has been about the power of governments, the state if you like, to counter the effects of globalisation... All governments find that their capacity to shape their economies is limited in the late twentieth century. This is difficult for many to recognise and they refuse to admit the validity of the limits" (public lecture on 'What Should Be India's Priorities in a Globalising World?' published by ICRIER, New Delhi, January 1999). At the other end of the scale is the emergence of hegemonic behaviour on the part of a powerful country which may help evolution towards a unified global order. On an optimistic view, such a country may even act consciously with the objective of helping such an evolution.

The emergence of the single currency in Europe and the progress in the direction of greater integration for a united Europe represent 'global' as opposed to 'international' outlook. But will united Europe, when it comes into being (and there is many a slip between the cup and the lip) continue to display a similar outlook in its dealings with other nations?

The UNDP Report defines what I have called internationalism as a jurisdictional gap. It states, "While the policy issues are global in nature, policy-making is still primarily national in character." The report rightly states that this jurisdictional gap needs to be bridged. It is not primarily a matter of establishing new institutions, but rather of changing the mindset. The problem is similar to that encountered at the national level. A global rather than an international view is what is required for moving towards a genuine global order.

Metamorphoses of Agrarian Capitalism

Jairus Banaji

Ecological and Agrarian Regions of South Asia circa 1930, edited by Daniel Thorner; Oxford University Press, Karachi, 1996; pp 148.

Daniel Thorner's ecological and agrarian atlas is a remarkable work by any standards. The idea for the atlas was conceived towards the end of the war, when Thorner and Chen Han-seng met and discussed it in Delhi. Much of the work towards creating it was then done in Philadelphia in the late forties, when Chen wrote the monograph which forms the core of the atlas, and the project rounded off some 15 years later, in Paris, where Jacques Bertin of the Cartographic Laboratory (or 'Carto' as it is called) at the Ecole Pratique des Hautes Etudes, Section VI, visualised and co-ordinated the cartographic representations of Chen's argument. Thus the atlas consists essentially of Chen's detailed description of the natural conditions, agrarian relations, crop production and overall economic development, around the year 1930, of 21 regions; two illustrative maps for each region; and the districtwise statistical data on which the land use and crop diagrams are based. The atlas is a fascinating attempt to produce a comprehensive regional mapping of the agrarian state of the Indian subcontinent on the eve of the great financial crash of 1930. It would be hard to imagine a project on this scale and of this nature as a solo, or to imagine it being accomplished at one stroke, and in fact the atlas has a long and chequered history whose full story is best told in the whispered cadences of disappointment and frustration with the boorish intervention of bureaucrats (academic as well as governmental) who, among various disfigurements, proceeded to mutilate the maps by inserting the international boundaries valid in 1981 into maps that were clearly labelled "1930"! This invention of the partition before its time by the Survey of India need not distract us any further, except as a fleeting example of the collective paranoia which breeds in the garbage heap of nationalism. This is a story best recounted by the one person whose labour of love brought the atlas to the light of day, finally, in 1996, with its place of publication in...Karachi; but she is not quite ready to do so!

The 41 four-colour topographical and crop pattern maps are beautifully designed

(the mutilations having been reversed), and arranged in pairs for each region, the two sets being drawn to the same scale. They convey a great deal of information about geographical features, urban agglomerations, the extent of canal irrigation, and so on, and about the kind of cropping patterns that prevailed in the individual regions c 1930. The pie diagrams are designed to show the extent of double-cropping "by giving to the coloured sectors [corresponding to cultivated areas] an extension beyond the circumference of the circle proportional to the area involved". Daniel Thorner notes in his Preface, "The reader will note that we have not tried to provide either statistical data or maps for the various kinds of relationships among landholders, tenants, crop-sharers, and agricultural labourers. For the agrarian problem these relationships are, of course, absolutely central, but statistically they are well-nigh intractable." Thus the statistical tables, compiled by Nicholas Thorner, relate only to land utilisation and the distribution of crops, for each of 300-odd districts, with a classification of crops into 'foodgrains' and 'non-foodgrains' and not the usual, misleading, division into subsistence and cash crops.

The monograph is a central feature of the atlas. Chen's picture is one of staggering agrarian inequalities, widespread indebtedness, the general prevalence of 'uneconomic' holdings, huge fragmentation of operated areas, pockets of agrarian bondage and a steadily advancing tide of landlessness. Of course, these features are presented to the reader in their local, ecological context, and the monograph abstains from any summary other than the descriptions contained for the individual regions. At another level, the legacies of colonial agriculture also left considerable ecological damage. The displacement of food crops by higher-value 'cash' crops, or of inferior foodgrains by those fetching a better price is noted repeatedly. The one theme that emerges consistently through all the regional descriptions is the overpowering influence of that great abstraction, the 'market'. The fate of the Indian

countryside was largely, and of course increasingly, market-driven: the physical landscape, the extent and forms of stratification, the distribution of indebtedness, the pattern of tenancy, the investment in, and upkeep of, wells, were all influenced by the secular expansion of markets and the impervious sway of 'market relations'. Chen is also sensitive to social differences within the mass of the rural population, though he pays more attention, in the end, to the 'landlords' than to the more substantial peasantry. One reason might be the idiosyncratic nature of the evidence presented to the Royal Commission on Agriculture (1926-28), which compiled vivid descriptions of large landowners but interviewed almost no representative of the wealthier class of cultivators or substantial ryots. But the balance of emphasis was also consistent with political trends in the period. A powerful tradition of hostility to the large (or rather 'very large') landowners portrayed them as a major drag on the productivity of the Indian countryside, and Chen seemed to go along with this.

RICHNESS AND VARIETY

The strength and attractiveness of Chen's monograph is the attempt to construct a sense of regional multiplicity, of the great richness and variety that must have seemed strikingly obvious to an outside observer of the 'Indian' countryside. Excluding Kashmir and Sri Lanka, the rest of the subcontinent was mapped into 21 regions (five in Pakistan, 16 in India). Chen's mapping of regions was clearly uninfluenced by the contemporary evolution of state boundaries, and his disaggregations seem more complex for that reason. Thorner returned to this issue on at least two occasions in the late fifties and suggested a break-up that seems both simpler than Chen's and more in line with the emergence of the states themselves.¹ In the north, UP was treated as two regions, a constant feature of all regional break-ups. Chen also treated North Bihar as a separate region, and lumped Chhota Nagpur with West Bengal into an adjoining one. Thorner was uncertain about this,

and wondered initially whether "North Bihar and lowland West Bengal might not be studied as one region".² Chen put all of Orissa into a big southeastern region with its heartland in South-east Madhya Pradesh (Chhatisgarh and Nagpur); they were chiefly rice-producing, with "comparatively little area of ryotwari villages". Thorne seemed to agree with this at first and thought South Bihar might be included here; by 1959 he had changed his mind and decided it was best to treat Chhatisgarh, North Bihar, South Bihar, Orissa, and West Bengal as distinct regions. The real problems began with peninsular India, excluding the coastal belts. As Thorne noted, "there is lack of agreement about where to assign the following four areas: (1) the Khandesh-Berar-Nagpur-Wardha tract; (2) Telengana and parts of Rayalaseema; (3) the Salem-Coimbatore districts of Madras; and (4) parts of Karnatak".³ The first of these areas was split three-ways by Chen, Khandesh lumped together with Gujarat, Nagpur assigned to 'Central Provinces (East)' (or south-east Madhya Pradesh), and Berar incorporated into the 'Maratha Region'. "Gujarat and Khandesh together form a great alluvial plain, with a more or less uniform soil...", he argued. A rather general geographical characteristic was again the only basis for including the last area ('parts of Karnatak') in the so-called 'Maratha' region: "Karnatak...is really the southern prolongation of Bombay-Deccan". Thorne pointed out, "Dr Chen seems to be alone in explicitly including in the same region [Bombay Deccan], all three Bombay Karnatak districts of Belgaum, Bijapur and Dharwar".⁴ On the other hand, the Nagpur-Berar cotton zone of Central India was broken up, largely on the grounds that people consumed rice in Nagpur. Areas (2) and (3) (Telengana, Rayalaseema, and Central Madras) were merged with each other and with the old Mysore state to form one of Chen's most complex regions, called the 'Southern Deccan'. They formed a "dry, high, millet-producing region...dominated by the ryotwari tenure system". Thorne would later say, "When Dr Chen was carrying out his study, I recall his telling me that these were the questions which perplexed him the most".⁵ He preferred a simpler demarcation, allowing Madras to retain her interior districts, separating Inland Andhra from Coastal Andhra, and taking the "whole of the new Mysore state as a region"; four regions instead of three, and largely coterminous with the new state boundaries.⁶ For Chen the coastal areas were much easier to handle: Coastal

Andhra and the 'Tamil Region' on the east coast, Malabar (as far north as North Kanara) and the Konkan on the west, all came away as independent regions.

Chen demarcated his regions in terms of topography, water supply, crop system, land system, and general economic development. It is worth pausing for a moment to ask what kind of realities these variables express. Pure matter, Sartre argued, "does not appear anywhere in human experience"; if materiality is everywhere, it is also "indissolubly linked to the meanings engraved in it by praxis".⁷ As Alice Thorne explains in her foreword "Chen and Daniel were concerned to bring out the constraints on human enterprise imposed by physical factors such as topography or rainfall and, conversely, the ways in which human enterprise affected physical conditions, e.g. depletion or enrichment of soils, raising or lowering of subterranean water tables". 'Constraint' is not causality, and the examples just cited suggest that the meaning of Chen's narratives is more reliably grasped in the language developed by Sartre to describe what he called the "passive syntheses of worked matter", the "domination of man by worked matter", than in the atomising discourses of positivism; for example, the counterfinalities of crop patterns that exhausted the soil and destroyed food security, of projects for the development of agricultural resources which left widespread ecological damage,⁸ of tenancy laws that bolstered the more powerful agrarian groups outside the landlord class.⁹

THE REGIONS

As a prelude to the discussion that follows, it may help the reader to have a rough sense of Chen's description of specific regions.

Sind: a broad, dry alluvial plain stretching from the edge of the Baluchistan Plateau; by 1927 some 7,925 miles of canals were under the Sind administration. With the completion of the Sukkur Barrage, located three miles below the gorge of the Indus, the irrigation system was converted, in 1932, from an inundation to a perennial basis. The less valuable crops of millet are being substituted by wheat and oilseeds, and short staple varieties of cotton by the long staple cotton. Sind's low subsoil water provides excellent drainage. Rice, wheat, millet and cotton form the principal kharifs; ever since 1908 cotton has been substituted for rice; Sind now exports great quantities of both cereals and cotton. There is a large number of big landholders in Sind; in Larkana, for instance, one Khan Bhutto holds over 10,000 acres; all of this

land is leased to tenants-at-will who pay a share rent; tenants-at-will appear to be even more numerous than in West Punjab; more than 72 per cent of Sind's cultivated land is held by big holders who lease the land directly to tenants-at-will on the share rent basis. Tenants in Sind are known as 'haris'; "The hari in Sind corresponds with the 'bargadar' in East Bengal. When he is financed by the landlord, he is directed by him as to the types of crop to be grown". Ref to "loans extended by the landlord to the hari". (On rural money-lenders in Sind cf Cheesman (1982); for sharecropping on large estates, see Majid (1998) showing that Sind landlords integrate tenant labour with 'self-cultivation'.) *Coastal Andhra*: Known as the Northern Circars Region of Madras presidency, this sector accounts for more than half the presidency's total canal-irrigated acreage of 3.8 million acres. Rice is the leading crop but much less dominant here than in Bengal; tobacco is extensively cultivated in Guntur (see Duvvury, 'Commercial Capital', and 'Tobacco Trading'). While the northern parts of Coastal Andhra are dominated by the zamindari system of land tenure, the delta areas of Godavari and Kistna are dominated by the ryotwari; as concentration has gone much further in the delta areas, the percentage of landless tenants and hired labourers is accordingly much higher. In the village of Alamuru in East Godavari, fixed rent in kind ('kuthagai') is collected from the wet crop land; cash rent is collected on dry land where cotton, spice, sugarcane, and plantain are raised; on the Godavari deltas in general, half of the cultivated area yields a cash rent; one-fourth of the cultivated land is under the share rent system ('varam'), the remaining one-fourth bears a fixed rent in kind. In the delta areas an economic holding for cultivation cannot be less than three acres; a large majority of peasants do not have economic acreage to support themselves, e.g. in the village of Alamuru 72 per cent of the 'pattadars' have landholdings of less than three acres, and 90 per cent of the 500 families of tenants cultivate less than two acres each; usury flourishes in the entire region. (Cf Reddy (1996) for a district study, and Upadhyay (1988), Rao (1985), on the commercially-oriented rich peasantry of the southern coastal districts.)

Southern Deccan: Telengana, the Ceded Districts of Madras, the whole of Mysore, and Central Madras, a dry, high region in the rain-shadow of the Western Ghats, dominated by millets. In the Ceded Districts, cotton and groundnut have been responsible for deflecting large tracts of

land from the cultivation of food crops; this process started as early as 1905; in Salem, Bellary, and Anantapur, considerable lands under groundnut are being cultivated by 'the untouchables'. Tempted by the high prices of cash or commercial crops, the better-off landowners in the dry region buy more land and convert it into garden land by sinking wells; concentration of landownership is thus accelerated; sixty per cent or more of the owner-cultivators in dry areas are indebted. The southern Deccan on the whole is a ryotwari area; in Telengana, the transfer of land is especially fast in Warangal; most of the wet lands have been taken over by the 'deshmukhs' (bosses of the village) who use 'hhagelas' (serfs) to cultivate their lands; in one case, out of 912 acres of transfer of wet lands 848 acres went to the deshmukhs; in Warangal, of 489 tenants investigated in 1930, as many as 403 (82 per cent) were simply tenants-at-will. 'On the wet lands, however, there is more serfdom than tenancy'. (This is something we can come back to, since it illustrates the need to move away from abstractions to a more precise or rigorous description of the relations at work.) The Nizam of Hyderabad used to have a private estate called seif-i-khas which was estimated at 5 million acres. According to a government investigation in 1943, the total ryotwari area that changed hands from 1931 to 1943 in Madras was roughly 10.3 million acres; of this total, about 20 per cent went to non-cultivators. (Thus the bulk of the transfers were within the peasantry, to the richer groups. Cf the homologous process in Bengal described by Mukherji (1986). The primary cause of this concentration of landownership has been the foreclosure on debts; at least 28 per cent of the ryots and tenants in the typical villages of Bellary and Anantapur have become partially hired labourers; this is why the proportion of agricultural labourers in Madras has increased from less than 35 per cent before 1920 to 43 per cent since then. (The best historical work on the Madras dry region is by David Washbrook, esp. Washbrook (1973) and (1994)).

Gujarat and Khandesh: A great alluvial plain, "one of the best agricultural regions of India"; Gujarat itself divided into four distinct areas. In north Gujarat the water level in the wells is sinking, the heavy water tax and low agricultural prices have contributed to a decrease of irrigation farming; cotton, oilseeds, and in some places tobacco are the important non-food crops; well irrigation is responsible for the considerable area of tobacco cultivation

in parts of central Gujarat; also, owing to irrigation difficulties, paddy was displaced by cotton in Kaira after the great famines of 1899 and 1901. The Khandesh cotton peasant as a rule is fairly well off, but he, too, has to rely on the moneylender for loans to start cultivation. "In Khandesh and northern parts of Gujarat the acreage for groundnut reached 3,16,000 acres in 1926-27, whereas it had been only 4,500 acres in 1912-13". The main tobacco area is Kaira; the effect of commercial crops in Gujarat and Khandesh has been tremendous: "There is no doubt that the gradual decline in the cultivation of food crops and substitution of them by other crops generally for commerce and export is one of the chief causes of peasant indebtedness." Ref to the 'well-to-do cotton-growing peasants' of north Gujarat: "Generally the cotton growers here keep a running account with the village moneylender (sowcar) and sell their produce either to or through him." Seventy-five per cent of the total cultivated area of Bombay-Gujarat is held under the ryotwari system; in Ahmedabad and some other districts of Gujarat 'talukdari' tenure prevails; a survival of the joint village community paying a fixed sum of revenue as a whole is called 'narvadari' tenure; "The revenue of a narva village is assessed in a lump sum and collected by the village headman, known as moksha Patel. Each narvadar pays in proportion to his share of the total village land. All narvaders, however, are jointly and severally liable for failure to pay the total revenue or a part of it." B R Naik contended that the land revenue was 40 to 50 per cent of the net return from the field: "Had it not been for the sowcars, government would not have collected the revenue all these years"; holders of large areas of land easily shift their revenue burden to their tenants. Ref to "decline of the middle peasantry"; in Saurashtra 45 per cent of the village families are agricultural labourers; in most districts the majority, and even 'overwhelming majority' of rural families have holdings insufficient for subsistence. In west Khandesh, in 1917-22, there was a very marked increase in the number of holdings below 15 acres; moreover, "there was a decrease of the better-off owner-cultivators (middle peasantry)". Ref to the "great reservoir of agricultural labourers" throughout this region; by 1931 they had increased to 54 per cent of the total rural population; undoubtedly, Gujarat leads all other regions in the high percentage of agricultural labourers; a considerable number come from Kathiawar for cotton picking. "A significant number of the farm hands

are called halis"; of them Chen says they are "not free wage-earning workers but virtually serfs". (Thorner himself allowed for a category which he called 'unfree hired labourers', and it is surely more accurate to see the halis as a labour force of that kind. See Breman, *Patronage and Exploitation* for a study of these workers.) Description of Walchand Hirachand's estate near Malegaon. Chen clearly sees Walchand as a 'capitalistic cultivator', but argues that the number of such cultivators barely grew in the thirties and the acreage cultivated with the help of hired labour even declined: "agriculture in this region is not developing along capitalistic lines". (Cf Rutten (1986), for a description of entrepreneurial farming among the 'middle-large farmers' of Kheda district, where tobacco is the main commercial crop; and Bates (1981) for their antecedents.)

INDEBTEDNESS, LAND TRANSFERS AND TENANCY

Even these brief descriptions show that decades of agrarian development had left large sections of the rural population beleaguered by indebtedness, land transfers, and the widespread prevalence of tenancy. The commercialisation of grain trading in the earlier decades of the twentieth century "had far-reaching implications for the employment of labour", leading to a "general disemployment of permanent and tied farm servants and a casualisation of wage labour" and the rapid proliferation of small farms.¹⁰ At any rate, inequalities worsened, the small farm sector was being pulverised, and the land-poor were swelling alarmingly. The Depression supervened on countryside where the engrossment of land had already left the majority of households deprived of sufficient acreage for subsistence. Chen's repeated observation of the generally high percentage of 'uneconomic' holdings was drawn from evidence compiled by the Royal Commission on Agriculture before the crisis of 1930. Depression and famine were powerful agents of land concentration,¹¹ and by the forties the situation would have been considerably worse. However, beyond these general patterns, the regional map is one of diverse configurations and distinctive social trajectories: at one extreme, Sind encapsulated the virtual obliteration of a free peasantry through the long-standing domination of the large estate owners and their fierce control over the haris;¹² at the other, on the east coast, the Kistna and Godavari deltas saw the rise of a numerous class of wealthy cultivators controlling large pools of migrant labour in 'an unbroken sea of

irrigated rice-fields'.¹³ These were very different agrarian societies, even if the forces at work in each of them (canals and commercial expansion) were broadly the same. Other regions were less clear-cut, mixed in their composition and trends, though generally reflective of a pattern of deepening impoverishment and growing polarisation. Thus Western India was characterised by a greater predominance of the 'middle peasantry', with markets still dominated, to one degree or another, by professional moneylenders. In the dry region of Madras presidency, a minuscule but powerful 'magnate' element in the peasantry exerted overwhelming control over the mass of poorer ryots, who were described to the Commission as a 'struggling proletariat'.¹⁴ Finally, there were strong ecological influences on the pattern of rent and on levels of landlessness, especially in the south.

Chen was uncertain about the general characterisation of these trends. He viewed agrarian capitalism as the growth of large-scale farming based on hired labour ('Gutswirtschaft'). The private farms carved out of 'sir' land by the relatively more enterprising zamindars in UP were a 'rudimentary' form of 'capitalistic agriculture'. They were described by Chen as 'Junker type farms' and said to number "at least 401 in the entire province". However, "The enterprising zamindar-managed farms have not made much headway"; "the general tendency is to lease land to cultivators instead of cultivating it themselves".¹⁵ The implication here is that the decision to opt for tenancy as opposed to wage-labour was not based on rational considerations but (presumably, and by convention) a reflection of deep-rooted *mentalites*. In Gujarat, too, agriculture was "not developing along capitalistic lines" because the acreage cultivated with the help of 'hired labour' had ostensibly declined.¹⁶ These judgments need to be assessed with some care.

To begin with, an overly rigid dichotomy between tenancy and wage-labour does not easily chime in with the considerable fluidity with which tenants became labourers and vice versa. There is clearly something suspect in the ensuing image of their moving into and out of wholly distinct, structurally opposed, 'relations of production'. (Tenants frequently worked as labourers and labourers as tenants.) Secondly, tenancy and wage-labour were not watertight categories. Chen's own monograph shows this in his treatment of the poorer class of tenants. The Punjabi 'muzara', the Sind haris, the 'adhiars' and 'krishans' of Bengal, and the

'verumpattamdars' of the Madras presidency were simply labourers recruited under forms of tenancy which gave their landlord-employers' full control over hire and fire. The majority of these groups worked as sharecroppers, and Chen would have agreed with the view propounded later, on the basis of Spanish and Latin American evidence, that "sharecroppers are often more akin to piece-workers than to serfs".¹⁷ For example, he points out, "the one-third share of the crop kept by the krishan really represents his low wage, and a krishan, though nominally a tenant, is in reality a contracted labourer";¹⁸ about the form of *varam* under which the tenant provided only his labour and kept some 16.5 per cent of the produce for himself, he states, "In reality he is a contracted labourer for cultivation".¹⁹ The argument here is not that the use of these forms of tenant labour constitutes capitalism, but that their presence (and 'tenancy' more generally, that is, tenancy as such) does not rule out capitalism in agriculture, and should not be construed as doing so. To return to the UP zamindars, judgments about the rationality or lack of rationality of the Indian landlord class would surely be more reliably framed if they took account of the fact that "landowners compare the effects of hired-labour and the effects of tenant-labour on labour costs",²⁰ and that in this sense at least the use of tenant labour, that is, "leasing land to cultivators", could have a rational basis.

AGRARIAN CAPITALISM

These are preliminaries. The more general, and substantial, point is that agrarian capitalism is conceived too narrowly in the literature on India, on models which are simply unrealistic when applied to the social and ecological circumstances of this part of the world. The later 19th c was a complex watershed beyond which lay legacies that are still alive today. The spread of new cash crops, the consolidation of dominant agricultural castes, the restructuring of rural credit markets, and the cycles of dispossession through which the stronger and more expansive groups increased their control at the expense of a less substantial peasantry were major developments common to most parts of the country and would clearly have hung together in some way. There are at least three broad forms in which we can see capitalism at work in the Indian countryside, and we can call these commercial capitalism, large-scale agrarian capitalism, and peasant capitalism, respectively. If we define these as forms of capitalist economy, it is clear that the relationships

between them were exceedingly complex, that is, both ecologically variable and mutable over time. Large-scale agrarian capitalism or *Gutswirtschaft* failed to establish itself in the core regions of the countryside, a fact which was abundantly clear to the Royal Commission already in the 1920s. It is the sense of this failure which hangs over the monograph even 20 years later. In contrast, however, commercial capitalism was widespread, as it still is, while peasant capitalism emerged with a strong base in the gradual consolidation and expansion of substantial peasant elites throughout the country.

The commercial capitalism of the late 19th c integrated trade, moneylending and the global business of the large export houses in complex and ramified networks that fanned out to cover whole regions. These links have scarcely been reconstructed in detail for any of the main commodity markets. For example, an official appointed to investigate the operation of the Deccan Agriculturists' Relief Act noted in passing, in 1883, that "The larger Sowkar must also have suffered through the losses of the smaller owing to the latter's inability to repay loans; and it is possible that in some cases they may have found it hard to meet their engagements with the great trading houses in Bombay".²¹ The circulation of capital intermeshed with a hierarchy of trading levels, cascading down these levels to the myriad advances through which merchants, planters, and moneylenders sought control over household production.²² If rural employers used debt as a means of tying workers down,²³ as they have done everywhere and throughout history, and rich peasants used debt as a means of dispossession and land engrossment,²⁴ commercial capitalists were chiefly interested in establishing control over commodities, and the drive to control the labour and resources of the household was in general incidental to that aim. The limiting case of such control was the 'vertical integration' of the more aggressive mercantile businesses into land control and agrarian production, so that commercial capitalism came to share a boundary with 'large-scale agrarian capitalism', and the failure of the latter to stabilise in the core regions can partly be seen against this background.²⁵

But failure is not the same as non-existence, and Chen's monograph is full of vivid descriptions of wealthy agrarian capitalists. He drew those descriptions from the volumes of evidence compiled by the Royal Commission. The Commission solicited the views of landowners (and officials, engineers, etc) on a wide range of

subjects geared to improving agriculture. The chief interest of their testimony lays in its possible reference to their own farming operations, and these vignettes seem as attractive today as they obviously did to Chen. To begin with, we should note that the landed elites of the zamindari areas were not totally impervious to "[taking] a personal interest in the business of farming". The commissioner of the Patna division told the commission, "most of the big zamindars have large areas under private cultivation", referring to the *zarat*.²⁶ In Awadh, where, "owing to the nature of the land tenure, it was easier – to arrange for compact areas", the number of model farms more than doubled to 964 by the late twenties.²⁷ "The zamindars are waking up", said a leading landowner of Gorakhpur, whose own home farm comprised about 600 acres cultivated mostly by labourers paid in cash.²⁸ The *Atlas* contains other examples of such big agrarian capitalists. The bania landlords of the Central Provinces are a striking case: Messrs Chandrabhan Bihari Lal were a private firm of large-scale agriculturists and grain-merchants in Jabalpur, with a total estate of 60,000 acres and 5,000 under direct cultivation through hired labour paid mostly in kind at a standard wage valued at Rs 7-8-0 per month. Wheat was the main crop, and the workforce comprised "about 400 men on the permanent list". "We have tried to make our farms as compact as possible in our villages", said a member of the family to the commission.²⁹ In the late 19th century, Marwari banias invested heavily in the wheat tracts, and some, like the Raja Gokuldas of Jabalpur, even "moved into industrial undertakings at the end of the century".³⁰ In Sind, "Hindu traders were keen to start up their own farms: much of the profit they made from trade was invested in land, particularly in the cotton-growing areas of eastern Sind".³¹ In Bombay presidency, Walchand Hirachand told the Commission he "took to agriculture as a business". He was the owner of a 'big estate' seven or eight miles from Malegaon in Nasik district, 1,800 acres, 700 of this under irrigation, "almost mechanised", as he described it, growing cotton, sugarcane, chillies, tobacco and bananas, with further plans for a "very big fruit plantation" of 100 acres. All this was based on 'permanently paid labourers' and seasonal labour. There was no obvious indebtedness in this workforce and loans, when they were given, were free of interest.³²

So large-scale agrarian capitalism had certainly emerged but it failed to take off, to establish itself as the dominant form of

agricultural production, except in regions such as Kuttanad in Kerala, where special circumstances favoured its growth.³³ The zamindari capitalism of the north, perpetually hesitant, was finally doomed by nationalism and the partition. The integration of landholding with the grain-dealing and moneylending businesses in the Central Provinces failed to transmute itself into a more widespread form of large-scale, mechanised wheat farming. However, these abortions emphasise not the weakness of the capitalist spirit in India but its meticulous application. The Commission preferred to explain the stagnation of large-scale agriculture by the 'conservative mentality' of the zamindars.³⁴ By contrast, the zamindars explained to the Commission that 'large farms' were a prerequisite for 'men of capital and enterprise', and that for agriculture to be a paying proposition what mattered was not the rate of profit but its absolute mass.³⁵ It is also worth drawing attention to Chitta Panda's argument that, in the more extreme circumstances characteristic of Bengal, 'zamindars lost all interest in improving their estates', and that their 'apathy towards improvement' was in fact a 'rational' response.³⁶

'PEASANT' CAPITALISM

What did develop, then, and almost with a vengeance, was a diffuse and relatively entrenched form of 'peasant' capitalism. The colonial sources are replete with references to the 'richer ryots', 'wealthy farmers', 'substantial cultivators', 'big agriculturists with substantial assets', 'large jotedars', 'well-to-do substantial yeomen', 'big influential ryots', etc. In the historiography of colonial India, no region has seen a sharper focus on the 'rich peasant' element than Bengal, largely because Rajat and Ratnalekha Ray were willing to disregard the orthodoxies of nationalist historiography and underline the divided or stratified nature of Bengal village society towards the close of the 18th century. The impact of colonialism cannot be visualised as the creation of a 'uniformly downtrodden peasantry',³⁷ nor can it be seen as a movement from no differentiation to considerable differentiation. These images downplay the considerable 'stratification' with which most villages entered the period of strong commercial expansion in the 19th century.³⁸ The Mughal revenue system had presupposed the existence of 'dominant peasants',³⁹ and that legacy survived till well into the 18th century. The *narvadar*s of the Charotar or the powerful village heads who dominated the Bengal villages be-

neath the shadow of the huge zamindaris inherited from the administration of Murshid Quli Khan are almost perfect exemplars of these pre-colonial rural oligarchies.⁴⁰ On the other hand, the 'capitalist' differentiation of the peasantry which gathered momentum from the 1880s was not a mere replication of those hierarchies. Ratnalekha Ray argued that, by the 1930s, "the scene had still not changed substantially" in the North Bengal districts where the big jotedars had been a powerful element in the early 19th c. "Such change as occurred...lay in the direction of further extension of the influence of the jotedars and greater ramification of their political and economic control over the villages".⁴¹ "In economic terms, the class of large farmers found by Buchanan-Hamilton in Dinajpur in 1808 was the same as the jotedar class observed in the district in the 1930s by the next surveyor, F O Bell."⁴² Yet Ray also refers to the Dinajpur jotedars of the depression years as 'capitalist jotedars',⁴³ so all this tends to convey the impression that they had always been capitalists of some kind. Panda has argued that in Midnapore "the emergence of a group of powerful peasants reduced the zamindars as a class to a level of insignificance".⁴⁴ This can always be read as a bold re-assertion of the jotedar thesis but 'emergence' suggests that the earlier hierarchies were now increasingly grounded in, and affected by, new economic and legal realities. Nakazato emphasises the growth of a land market in creating a 'new' process of stratification after the 1880s.⁴⁵ Hardiman has argued recently that the willingness of some peasants to expropriate others implied a distinctively new set of peasant attitudes, a "powerful change in peasant consciousness".⁴⁶ These are interesting pointers to a 'reshaping of agrarian society' from the bottom upwards. In large parts of the country these were decades characterised by the steadfast upward mobility of a range of middling agricultural castes.⁴⁷ Most accounts highlight the expansion of new cash crops, the extension of irrigation, or the growth of a 'peasant land market'. More fundamentally, however, the growth of agrarian capitalism at the village level was at least partly a response to the pervasive threat of other kinds of capitalism and their considerable hold over large sections of the peasantry. In their own subjection to the market, the more substantial cultivators would be forced to accumulate to retain their landholdings or progressively lose their independence to larger landholders and commercial capitalists. These struggles were underpinned by major

advantages (or disabilities) of caste, and waged by means of legal protection for occupancy rights and expanding peasant control over rural debt markets. In Punjab 'agriculturists' ousted 'non-agriculturists' from control of the debt market.⁴⁸ In the east, the Bengal Tenancy Act of 1885 precipitated a large-scale movement of land transfers in the last two decades of the 19th century.⁴⁹ In UP the largely successful pressure for commutation of rents eroded the position of both landlords and the mass of labourers. Agrarian legislation abandoned the 'tenants-at-will' to their fate, and government showed little interest in the fortunes of the vast and steadily expanding pool of rural wage-labourers.

The rural labour market is certainly the least understood sector of the colonial economy, because of our manifest lack of a totalising conception of its structure and operations. The self-diremptions of the understanding are legion in this field. 'Wage labour' is counterposed to 'bondage', 'hired labour' to 'tenancy', 'feudal' attached labour to 'free' casual labour, and so on. The upshot of all this is that wage-labour emerges as a veritable Garden of Eden, and markets are shorn of the coercion and sheer exertions of power which are integral to the way they function in reality.⁵⁰ Substantial cultivators in particular made widespread and extensive use of farm servants or permanent labourers who were subjected to various degrees of bondage. The summaries reproduced earlier show that Chen regarded such workers, the halis of Gujarat or the bhagelas of Warangal district, for example, as 'serfs', 'de facto serfs', or 'virtually serfs'. These descriptions are purely conventional and have little value from a scientific point of view. 'Unfree hired labourers' would be a much better description for them.⁵¹ About the halis, Shukla wrote, "The only thing, and a very valuable thing indeed, is his own labour, and this he pledges, as it were, for the money borrowed...".⁵² Farm servants like halis and bhagelas were paid wages, generally in kind, and Chen's sources refer to the landowners who employed them as 'employers', 'employing landowners', as well as 'masters'.⁵³ Farm servants were a category of hired labour.⁵⁴ That the deployment of these forms of hired labour was characterised by considerable coercion, including debt bondage, especially in the colonial period, is incidental to the essential nature of the relationship as a domination of wage-labour. The dispossession of tribal 'castes' such as the halpatis,⁵⁵ and the role of caste in institutionalising the landlessness of the

'agricultural labourer castes' were part of the way agrarian employers managed, and retained control over, the labour market.

Farm servants, field labourers, and the mass of sharecroppers and tenants-at-will formed a vast pool of hired labour which was crucial to the agrarian expansion of the 19th century. There was also considerable flexibility in the way these categories of labour were actually structured and deployed. For example, labour tenancy was fairly widespread, though it is scarcely ever mentioned in the academic literature on India. Under this system, labourers were given a small plot of land to cultivate for a nominal rent or rent-free. Daniel Thorner called these 'tie-in land allotments' and stated, "Land allotments of this type...are very widely reported for attached workers".⁵⁶ In 'Types of Employer-Labourer Relationships in Agriculture', published a year later (in 1957), he and Alice Thorner noted several instances of this type of arrangement, for example, the system of chanamalu found in districts like Guntur.⁵⁷ N G Ranga provides an interesting description of 'chanamalu' in the mid-twenties. "The ryot leases out a certain amount of land to his servant on certain conditions which are more favourable to the latter than are usually allowed to an ordinary renter. In return for such a privilege, the servant agrees to send his wife and other people in his family to work for the customary wages for the same employer, whenever their services are demanded, even if he can get better wages from other ryots."⁵⁸ Ranga's account was later reproduced verbatim by Sayana, who added, "When a cultivating big landlord leases out his land in the village, he may have reason to choose very poor ryots or farm labourers as his tenants in order to command constant and assured supply of labour...In other words, the system of tenancy sometimes works out into a method of mustering labour to work on land".⁵⁹ Ranga's description makes it clear that the 'cultivating big landlords' referred to by Sayana were in fact the more substantial cultivators ('ryots'). A recent study by Lucia da Corta shows that labour tenancy is still used in Andhra Pradesh today, and has even expanded since the seventies. Referring to it as 'tied labour through lease', she writes, "capitalists use such arrangements not merely to secure labour at peak periods but also in order to reduce labour costs of men and their families".⁶⁰

TENANCY AND WAGE LABOUR

Now just as much of what passed for tenancy was simply a form of wage labour,

so a lot of rural wage-labour was characterised by debt bondage and embedded in the wider institutions of caste and tribal oppression. One of the most striking examples of this is the case of the 'agricultural labour caste' attached labourers of Kuttanad employed by the large nair and syrian Christian tenant cultivators who invested in the reclamation of paddy fields from the later part of the 1880s. These reclamations were handled by organised groups of 'enterprising farmers' and financed by state funds and commercial banks,⁶¹ while the workers were drawn from the landless putaiyan and paraiyan castes. Thus here is an example of a manifestly oppressive system of 'attached labour', rooted in both caste and debt bondage, being deployed by a class of agrarian capitalists. Alex George produced a vivid description of this period of increasing capitalist investment in the pages of this journal, but referred repeatedly to the labour system as a 'feudal' one.⁶² This 'feudal' system is said to have prevailed 'even when' capitalist investment was made in paddy cultivation, or 'even during' the stage of increasing capitalist investment⁶³—anomalous characterisations since no claims are made about the 'co-existence' of different 'modes of production'. George himself notes that the labourers in question were employed on wages,⁶⁴ in other words, that their labour was covered by the wage form, and 'feudal' is simply a loose way of referring to the use of coercion in the control of a labour force that played a major role in the largely labour-intensive agrarian capitalism of the reclaimed tracts. In the Telugu districts the 'paraiyans attached to the raiyats or cultivators' appear to have been called palalu, 'hired labourers', and they too were subject to serf-like conditions, since employers sought to reclaim labourers who fled.⁶⁵ In a memorandum on rural labour submitted to the Royal Commission, Radhakamal Mukherjee described the padiyals of the Madras east coast as 'a sort of serf', yet noted that their wages were generally paid in kind.⁶⁶ Dharma Kumar describes the padiyals as "hired farm servants receiving wages in kind", and notes that they were frequently 'hired for very long periods'.⁶⁷ The Bihar kamiyas were likewise wage labourers, though conventionally described as bonded labourers or 'bond servants of their masters', since their wages were likewise 'converted' into 'loans'. As one official noted, piercing the web of appearances that surrounded these ways of controlling hired labour, "The fiction is usually kept up that the labourer is in

his master's debt". B B Chaudhuri points out that peasants of superior castes were major employers of such labour, and cites the following observation: "Possessors of a larger kind of farm, with area from 15 to 30 bighas, and even less, know the importance of preserving this class [the kamiyas] alive." These 'middle class farmers' were said to "devote all their influence and much of their substance to keep the really poor in the district",⁶⁸ that is, prevent them from migrating.

The substantial peasant elites who emerged in large parts of the country must have accounted for a considerable part of the demand for permanent farm servants and migrant workers. By 1879 the patidars were described as "the most thriving class of cultivators, many of them tilling their fields entirely by hired labour".⁶⁹ In Birbhum and Bankura hired labourers were usually employed by "well-to-do farmers holding from 30 to 80 bighas".⁷⁰ By the twenties it was possible to claim, "In the villages the more substantial cultivators, such as the jotedars of Bengal, the patidars in Gujarat, the lingayats of Bombay and the superior peasant proprietors of the Punjab, now take a less active part in field operations than before and employ farm hands".⁷¹ In Guntur, where FCV tobacco expanded rapidly in the depression years, "wage labour constituted the predominant form of labour input for farm size classes above one acre".⁷² In Gujarat, too, there was a huge 'reservoir' of landless labourers by the 1930s, the Census classifying over half the rural population as agricultural labourers.⁷³ Thus Chen's statement that in Gujarat this was a period when agriculture was "not developing along capitalistic lines" seems at least mildly surprising.⁷⁴ But Chen sometimes replicates the descriptions of his immediate sources with a literalism that is liable to mislead, and that is certainly the case here. M B Desai proposed two arguments, first, that the number of farmers relying exclusively on hired labour was 'very small', and secondly, that the acreage cultivated "with the help of hired labour" had gone down (since the thirties).⁷⁵ Both arguments together were meant to show that "there is no tendency towards capitalistic farming in Gujarat". However, what Desai meant by 'very small' is shown by his reference to Ahmedabad: "In Ahmedabad instances of farmers depending entirely on hired labour for agricultural operations were not many... On a rough estimate it may be said that only about 10 per cent of the farmers depended entirely on hired labour".⁷⁶ Yet by the benchmark of other districts elsewhere in the country, 10 per

cent was on the high side. For example, Ramkrishna Mukherjee estimated the size of the jotedar/rich farmer class as 8 per cent of all rural families in Bengal.⁷⁷ In his own classification of the Deccan peasantry, Woodward estimated the 'higher class' of rayats to be "not more than 10 per cent of the cultivating class".⁷⁸ Responding to the general tenor of Woodward's report, at least one official described this group of 'prosperous agriculturists' as 'rayat capitalists' who were progressively dislodging the sowkars from the debt market.⁷⁹ In fact, it is hard to see how a class of cultivators relying exclusively on hired labour could be substantially in excess of some level such as ten per cent. Moreover, Desai himself noted that all the 'prominent classes of farmers' in the main Gujarat districts such as Broach, Kaira, and Surat, "employed hired labour in the fields".⁸⁰ As for the acreage covered by the application of different forms of labour ('domestic' and 'hired'), Desai never explained from where these figures were obtained or how they were calculated. No source is cited for the table produced on p 152 of his book. It is likely that the data for 1931 were drawn from the Census of that year, but Desai himself points out that the 1941 Census "does not supply figures of persons in various agricultural occupations".⁸¹ The only reference to all this is a cryptic note which states that "The shares of domestic and hired labour have been ascertained by taking the number of workers from the family of the cultivator and outside and calculating the days for which they worked in the fields during the year".⁸² It is not obvious what Desai meant by this but this method, clearly, would not have revealed the amounts of family/hired labour-time actually consumed or expended. Indeed, it is extremely doubtful if Census figures could provide even the vaguest indication of this, since the compilers of the Census did not examine the pattern of labour expenditure on the model adopted, for example, by the ICAR studies of the 1930s.⁸³

The true extent and nature of differentiation might also be concealed by an uncritical "obsession with the average size of holdings".⁸⁴ This is best demonstrated by Chen's use of the UPZAC figures on the distribution of landholdings in UP. He notes, for example, that "1.5 per cent of the UP landlords hold 58 per cent of the agricultural land", without the concomitant clarification that much of this land was in fact in the possession of a privileged tenantry that imposed formidable limits on the power of the taluqdars.⁸⁵ He also remarks, "the committee has found

that 46,39,331 or 37.8 per cent of the cultivators have holdings of less than one acre...", without wondering whether such marginal holders could seriously be construed as agriculturists at all.⁸⁶ The UPZAC figures were the subject of trenchant criticism by both Neale and Stokes, who pointed out that a very large part of the rural proletariat of the United Provinces, who were merely allotment holders, were lumped together with the mass of agriculturists proper.⁸⁷ The effect of this, paradoxically, was to obscure the profound differences between the 'true agriculturalists', such as the more substantial peasantry with which Charan Singh himself was connected, and the bulk of the rural poor, who, in UP at any rate, "crowded into the ranks of the lower tenantry"⁸⁸ rather than accumulating, more obtrusively, as a mass of landless agricultural labourers. Stokes suggested that the Committee "failed to obtain accurate figures of cultivating holdings" and grossly inflated the numbers of cultivators through double-counting, so underestimating the average holding.⁸⁹ More interestingly, the committee "stood at the end of a long tradition of UP Congress politics on the agrarian question. For its special purposes the committee chose to give prominence to the extremes of the landholding structure – at one end the large revenue-paying landlords and at the other the mass of petty agriculturalists struggling for existence on minute holdings. It passed over in silence the intermediate peasant elite... the calculation of the average holding as an arithmetic mean was a wholly unreal process... For the average was completely thrown out by the mass of small holders occupying a relatively small portion of the land."⁹⁰ Since much of Chen's monograph does in fact deal with 'average' holding size and the extent of 'uneconomic holdings', these criticisms of UPZAC's evidence contain a more general relevance.

The references that follow the notes update the bibliography contained in the monograph, but selectively, with no reference, for example, to classics like Krishna Bharadwaj's *Production Conditions in Indian Agriculture* or to any of the feminist and directly ecological perspectives that have opened up since the eighties. For its part, the *Atlas* is bound to remain essential to any bibliographical list in the agricultural history of India and Pakistan.

From Crisis to Redesign

A Lexicon for the New Financial Architecture

Jayendra Nayak

Several proposals made for re-architecting the international financial system are fraught with moral hazard and could thereby raise the probability of future crises occurring, although their immediate containment may be easier. This paper examines alternative ways in which financial crises are analytically represented, where explanations based on the fickleness of sentiment and of the panic that ensues compete with explanations based on the real economy antecedents and underpinnings of the crisis. Possible responses during a crisis are studied and measures for crisis prevention analysed. The implications of this for the new international financial architecture are discussed.

THE frequency and intensity of financial crises in recent years is matched only by the plethora of competing explanations of their underlying causes. There is disagreement too on how economies and markets, once sucked into the vortex of such crises, should extricate themselves from the resulting turbulence. More recently, and provoked partly by policy statements from multilateral institutions and inter-governmental groups, there have been suggestions on how such crises could be better prevented, including through a radical redesign of the standards, rules and governance structures that influence international financial flows. Here too, the several proposals which have been made seek to tug governments in contrary directions. They cannot all be feasible and, where feasible, they cannot all be right.

This paper provides a rapid guided tour through this rough and sometimes inconsistent terrain. The 1990s have chronicled an extensive set of financial crises: ERM, Mexico, east Asia, Russia, Brazil and Long-Term Capital Management (the last a crisis quickly contained), as also some spectacular derivatives losses like Barings and UBS. Some crises have started with a run on banks, others in a steep fall in the domestic currency, and in several crises the two markets are inextricably linked. A useful starting perspective is to recognise that in all crises, explanations based on the fickleness of sentiment and the panic that ensues, compete with explanations based on the real economy antecedents and underpinnings of the crisis. If international financial markets were informationally efficient, they would react quickly but in moderation to fresh news about changes in fundamentals. Instead, as they sometimes react through episodic crashes, changes in investor sentiment must

necessarily be incorporated into the analysis.

The paper is divided into six parts. The first two sections examine alternative explanations of crises based on apparent investor irrationality and on escalating risk. The third section discusses possible responses during a crisis. The next two sections examine how crises may be prevented, first through measures taken at home, and then through the creation of what has come to be ambitiously termed the new international financial architecture. A final section offers concluding comments. The paper focuses on conceptual issues, including ways in which crises are analytically represented, rather than on their empirical characterisation.

I

Are Investors Irrational?

Several explanations of crisis are anchored to the apparently inexplicable behaviour of investors and lenders, and of the panic that this behaviour can generate. Even where it is conceded that there are weaknesses in the fundamentals (the banking system may be fragile, the current account deficit may be high or firms may have leveraged dangerously by borrowing overseas) the suddenness with which crisis descends is inexplicable, triggered by a drastic shift in sentiment but without any perceptible change in fundamentals. In characterising this, the build up of sentiment is as important as its implosion. Economists have had a long-standing fascination with bubbles.

Bubbles: These are rapid increases in asset prices, unrelated to fundamentals, occurring as a continuous process with a rise at any point in time fuelling expectations of further price rises. Assets are mispriced when prices diverge from their fundamental values, but in the case of bubbles the divergence is more than a

random disturbance. Today's price is high because tomorrow's price is expected to be higher. When expectations are reversed, bubbles are followed by crashes. Here again, sudden price reversals on account of new information entering the market would not be regarded as a bubble imploding, but where sentiment changes without significant new information, it would. It has been customary to characterise several intense price booms as representing bubbles, from the Tulip Mania in Holland in 1636 to the South Sea and Mississippi bubbles in 1720.¹ More recent empirical work suggests however that investors responded rationally to market fundamentals in these cases, and these were therefore not bubbles.² This has spawned analytical work which has questioned whether bubbles are at all sustainable over long periods of time, and also whether bubbles can be *rational* in the sense that the mispricing is a function of fundamentals.³ The jury is out on whether the run-up to the east Asian crisis represented a bubble. Arguably, confirmation by hindsight may be irrelevant, as it is the beliefs of investors at the time that are germane. In a sentiment-centred explanatory model, it suffices for investors to believe that a bubble has formed which is likely to implode. It leads to herding and contagion.

Herding and contagion: While herding refers to the similarity of behaviour by investors *within* a market, contagion refers to similarity *across* markets, and both have acquired a new found relevance after east Asia. They are widely regarded as evidence of irrational investor behaviour. Investors herd when they respond weakly to direct information signals from markets where they have invested, but instead mimic closely the behaviour of other investors in these markets. Herding could, however, represent rational investor behaviour under

certain situations, for instance where an investor without strong research capabilities in a market imitates the investing pattern of an investor with such capabilities. Even for investors who are strongly research-driven, their private information about markets may differ from price signals emanating from these markets. For instance, an investor may be more optimistic than the widening spreads on sovereign bonds issued by a government may warrant. Yet he would trade more profitably if he were to be guided by bond prices rather than by his optimism. Again, if investors react in a broadly similar manner in correlated markets (those which are at the same stage of growth and have similar risk characteristics) contagion could well represent optimising behaviour. Within the new lexicon of financial crises, therefore, there are situations where herding and contagion can represent rational behaviour. So can financial volatility and noise.

Excess volatility and noise: Price volatility increases during a financial crisis, and this enhanced volatility is also often regarded as irrational. The notion of *excess volatility* is, however, conceptually meaningless, as there is no benchmark for normal volatility, even when financial markets appear relatively stable. Instead, it is standard analysis to regard financial markets as peopled by *information traders* (those who trade on authentic and accurate information) and *noise traders* (those who do not, including those who trade purely for generating liquid funds). Noise traders bring liquidity to markets, but also lead to asset prices diverging from their fundamental values. While the proportion of noise trades would arguably increase during a financial crisis, noise trading is often profitable over short time horizons, and therefore represents rational investor behaviour.⁴

Hedge funds and leveraged positions: After east Asia the behaviour of portfolio investors, and particularly of hedge funds, is sometimes characterised as destabilising. Hedge funds typically leverage strongly, and shifts in their perceptions of markets can therefore have a multiplier impact on markets, exacerbating market volatility. Notwithstanding this, a reality check on east Asia confirms that the financial reversals there during the crisis were dominated by overseas creditors, and portfolio investors into equities had a much milder impact.⁵ Further, while hedge funds have attracted much criticism, it is necessary to recognise the dichotomy within these funds: there are the directional players, who take a long-term view on a market and are prepared to commit capital

towards betting on this view; and there are other hedge funds which play on price differences between complementary markets (such as between a stock index and certain pivotal stocks which constitute the index or between differently rated bonds). It is really the directional players whose leveraged positions particularly accentuate the pressure on markets (as with the ERM), but most hedge funds do not fall into this category.

The multiple equilibria model: This model has become central to expectations based analyses of financial crises. The model is self-fulfilling in that changes in expectations lead to shifting equilibria. The model was first developed to explain bank runs, in a context where banks issue liquid short-term liabilities to depositors and have long-term illiquid assets in the form of loans.⁶ If depositors' expectations change suddenly, as in a panic, the outcome can be self-fulfilling. A high asset price equilibrium gives way to a low asset price equilibrium, not because the bank is initially insolvent but through a dramatic change of expectations among depositors, leading them to withdraw their deposits. The resultant sale of illiquid assets by the bank at prices significantly below their value on its books forces it into insolvency.

What begins then as a crisis of illiquidity soon develops into a crisis of insolvency, and the model has been extended to cover external country debt where short-term overseas creditors lend either to longer-term projects or to domestic banks whose assets are illiquid. Banks generalise to countries in this view, and external creditors then lend against the balance-sheet of a country (represented by its macroeconomic policy stance and economic indicators like the level of foreign currency reserves and the government's fiscal deficit). The central bank has short-term liabilities (payable out of its reserves) and long-term assets, and a run by creditors triggers a currency crisis.

How credible is this model? It clearly contains no explanation of why expectations may change, and illiquidity and insolvency are often difficult to tell apart. "Given that everyone thinks that everyone else will withdraw their funds, each individual should immediately withdraw his funds. If only the depositors had stayed calm, the assets would have paid off thereby justifying the depositors' faith in the bank. The equilibrium outcome for the bank – good or bad – then depends entirely on the passions of its creditors. This is the most successful model of a banking crisis in the economic literature."⁷

Notwithstanding this cynicism about the 'black box' nature of how panic develops,

the model has found a new-found popularity in recent years and has been at the centre of several economists' explanations of the crises of the 1990s. The Korean crash and the Mexican currency crisis seem particularly appropriate examples of multiple equilibria arising out of panic-driven changes in expectations. The reason for the panic may well be irrational, but the key point is that the investor response to it within the model is rational. It is rational for an investor to panic when all other investors do.

Second generation currency crisis models: Currency crisis models build in greater behavioural details of the responses of agents. The models recognise that it is the capital account rather than the current account that triggers balance of payments crises, and provide explanations for steep currency devaluations in a market which pits currency speculators against the government. In first generation models of currency crises, speculators optimise while the government adopts a rule-based approach to (say) credit expansion and pegs a key currency price.⁸ Rising domestic credit induces speculators, without warning, to strip the government of its reserves, and the attack is timed to prevent speculators from earning subsequent speculative profits, implying that speculators operate in a competitive market. The currency consequently crashes when reserves are positive, and the timing of the crash emerges endogenously from the model.

In second generation models the government optimises by choosing an exchange rate, while speculators have expectations about the future value of the currency. These expectations can alter randomly, and consequently these models do not solve endogenously for the timing of the crisis, and belong to the family of the bank-run model which leads to multiple equilibria.⁹ These currency crisis models will henceforth also be referred to generically as the multiple equilibria model.

II

Domestic Firms and Banks: Escalating Risks

In contrast to the formalism of multiple equilibria models, explanations more firmly anchored to changes in fundamentals can be expected to offer a more intuitive story of financial crises as they unfold in particular countries. Yet the macroeconomic story is a puzzle. East Asia has shown that financial crises can occur even when economies have a high underlying rate of growth supported by exceptionally high saving rates, the fiscal account is comfortably in balance, and inflation rates are low. Crisis can attack

countries where, in addition, the current account deficits are moderate.¹⁰ It is the microeconomic weaknesses, and the inadequacies of the regulatory and supervisory mechanisms within the financial sector to contain them, which are prone to trigger the crisis. In east Asia domestic firms and banks voluntarily took on dangerously high levels of risk, thereby precipitating the crisis. Banks took on unduly high risks on both sides of their balance-sheets, leading to adverse selection in their asset portfolios and vulnerability in meeting their liabilities. Worse, during the crisis some of the very best financial intermediaries and corporates faced the spectre of acute insolvency. This phenomenon cannot then be captured within the analytical framework of marginal firms falling prey to moral hazard, but becomes a deeply systemic problem.

Although there may not be government profligacy, the consensus after east Asia has run as follows: by leaving the restructuring and reform of the financial sector to late in the process of economic development, difficulties cascade for the effective regulation and supervision of the sector. When credit expansion is brisk, and the number of banks and other credit institutions permitted to grow rapidly, their supervision needs to be backed by disclosures which alert supervisors to weaknesses in asset portfolios and by a legal system which permits ready enforcement. While this consensus might have established an agreed agenda for financial sector reform, moral hazard and adverse selection are ubiquitous and their containment problematic, as the examples below indicate.

Asset financing: Adverse selection is aggravated when high levels of asset financing by banks occur, whether for real estate or for equities, based less on rigorous analysis of project viability or borrower creditworthiness and more on the availability of collateral. When the business financed becomes insolvent and asset values fall sharply, banks stand exposed as possessing insufficient collateral.¹¹ This is part of a wider problem of poor quality lending which includes credit being channelled preferentially to borrowers identified by governments.

Corporate leveraging: One of the distinctive features of east Asian firms was that they were highly leveraged. The extreme case was in South Korea where the top 30 chaebols had an average gearing of 4.70 at the end of 1996, but debt financing rose elsewhere in east Asia as well. Between 1988 and 1996, average interest expenses of the business sector as a proportion of GDP doubled in Indonesia, South Korea and Malaysia, and rose to 2.5

times in Thailand. When the quantity of outside debt rises so sharply during the buoyancy of a business cycle, its quality is in danger of deteriorating. A sharp rise in the proportion of credit to GDP then presages the accumulation of non-performing assets.¹²

Overborrowing in foreign currency: With overseas debt the firm is subject to a double whammy, and the impact of currency depreciation on a steep corporate debt overhang can hasten corporate insolvency. This impact is still containable, however, if foreign debt is suitably hedged or if the composition of foreign debt in total corporate debt is small. Exchange rate pegs which are strongly defended can lead to a dangerously high level of unhedged foreign borrowing during the run-up to a crisis.¹³

Absence of currency derivatives: Moral hazard is implicit when governments maintain pegged exchange rates (or indeed narrow band exchange rates). By providing an illusory view that currency risk is benign, they also retard the development of a deep and liquid foreign exchange derivatives market, where each borrower firm could manage its own currency risk. Emerging markets typically miss this point, with both the government and market participants believing that the primary responsibility for managing currency risk lies with the central bank. Instead, central banks would do well to foster the creation of an onshore liquid currency derivatives market, in the absence of which such markets invariably move offshore, and unhedged domestic investors are the worst hit when the markets fall steeply.

Implicit guarantees: Many overseas creditors have lent to banks, to finance companies and (in some countries) to corporates in emerging markets on account of higher yields backed by the perception of implicit credit guarantees. Some economists argue that this was the proximate cause of the sell-off in east Asia in 1997, as creditors realised that implicit guarantees were worthless.¹⁴ If risky outcomes are represented by a probability distribution, creditors often lent as though the lower tail of the distribution did not exist.

Perceptions of implicit guarantees arose because east Asian governments, in pursuing a strategy of making available credit to industrial firms, could not allow the banks to fail, thereby making it very attractive for overseas creditors to lend to such banks on the capital account on the balance of payments was liberalised. This is an important distinguishing factor between east Asia and Mexico.¹⁵

Underdeveloped equity markets: Underdeveloped equity markets make it

easier for corporates to raise debt and thereby risk over-leveraging. Liquid equity markets facilitate inflows of capital which are subject to less volatile swings (as these markets are more self-correcting than short-term debt markets) and therefore lower the risk in permitting foreign capital inflows. These markets become deeper and more liquid when supported by a large and fast growing domestic fund management industry.

III Fighting the Crisis

Inadequate instruments – the macro-economic dilemma: For economies with liberalised capital accounts which are sucked into the vortex of a crisis whose outcome can have multiple equilibria, two priorities compete immediately for government's attention: maintaining confidence among overseas investors; and ensuring that the crisis does not drive local firms and banks with extensive unhedged foreign currency borrowings into insolvency. Both require the exchange rate to remain stable, for otherwise a vicious cycle develops of falling exchange rates, loss of overseas confidence, further outflows and an even steeper exchange rate fall. In recent crises and in the very short run, governments with the assistance of the IMF and other multilaterals have reached out for three mechanisms to keep the exchange rate stable: sharply raising interest rates; organising an overseas debt reschedulement; and negotiating alternative lines of credit to substitute for the outflows. If confidence does not return quickly, and the limits to debt reschedulement and alternative credit lines have been exhausted, more overseas investors can be expected to leave, and the pressure on the currency can be relieved only through periodic rises in the interest rate, which very soon lead firms into insolvency. If the currency is allowed to depreciate in order to relieve the interest rate pressure on firms, confidence is further eroded, outflows resume and pressure on the exchange rate further tightens.¹⁶ If the crisis was triggered through a realisation of the fragility of banks, the latter need to be rapidly recapitalised, putting renewed pressure on the government's resources and risking a further hike in interest rates.

The vicious cycle can be expected to continue until a drastic import compression leads eventually to a balance on the external account, and the financial crisis thereby leads to a large output contraction. As they have grappled with this, governments have sought an enhanced level of liquidity support from the multilateral institutions and industrialised country governments,

while broadening their intervention options to include fiscal support to the banks and the imposition of exchange controls. In assessing the impact of these macroeconomic policy interventions it is helpful to distinguish between what have been described as hard-money and soft-money strategies.¹⁷

The hard-money strategists would defend the exchange rate at all costs in the belief that this is critical to recreating investor confidence. Of course, the credit squeeze needed to support this will compromise the ability of the government to recapitalise banks, but the latter can be phased in as long as the exchange rate is stable provided local depositors do not withdraw their money. The very high interest rates needed to achieve this would very soon make firms insolvent and the success of this strategy therefore depends on the quick restoration of overseas confidence.

The soft-money critics argue that domestic insolvencies will occur faster than the restoration of overseas investor confidence, and the avoidance of excessively high interest rates is critical to preventing banks and firms from defaulting. The defaults would be systemic and not just affect some banks and firms. They argue that pressure on the currency would ease if deep lines of multilateral credit could be made available and that global finance should be 're-architected' to build in such contingency financing. Of course, without such financing in place the exchange rate will fall and the soft-money strategy will be ineffective, unless capital controls are imposed leading to a temporary cessation of payments.

The IMF steered a course in Asia between these two strategies. It advocated high interest rates but not necessarily to the point where the exchange rate would be stable, necessitating an external financing package which it put together for Thailand, Korea and Indonesia. The financing package, however, turned out to be inadequate to prevent the currencies from falling in the short term. It also demanded of governments a high level of fiscal restraint (despite government finances being very much in balance), which further added to recession. The IMF package attracted criticism from both sides of the debate, and certainly did not stem the outflows immediately. Hard-money advocates like currency boards and those who argued that cronyism lay at the heart of the crisis were critical that the underlying weaknesses were not seriously addressed, while soft-money protagonists were equally critical advocating that interest

rates be kept low and the structural reforms be deferred to after the crisis had abated.

The suspension of payments: In both the multiple equilibria model of bank runs and its extension to currency crises, the temporary suspension of payments is clearly a feasible option. Malaysia imposed controls on capital outflows in 1998 to ward off its currency crisis, and removed most of them a few months later. Timing is critical to such a strategy, and the Malaysian intervention was both unanticipated and well timed.¹⁸ It is clear then that selective and properly structured payment suspensions can be effective. A crucial question is whether such temporary suspension in payments will affect future inflows. It must surely do so when governments make a habit of suspending payments as suspensions will no longer be unanticipated. Empirical evidence is slender on whether a one-time suspension will be detrimental to future inflows, and the longer-term impact of the Malaysian control on outflows will need to be assessed.¹⁹

IV Preventing Crises: Measures at Home

The first lesson of the crises of the 1990s is that the regulation of banks and of capital market organisations must keep pace with their growth, and that they must at all times be adequately capitalised. Most emerging markets do not meet with these requirements and undercapitalised banks will increasingly lack credibility. Supervisory systems are inadequate, and when the financial system is threatened with crisis, the confidence of depositors and investors can crumble rapidly. Enter the world of multiple equilibria.

Surveillance and early warning systems: Surveillance demands higher levels of transparency through better disclosures from banks and other key financial intermediaries, as also from the government and its central bank. These generally help to make the market more efficient.²⁰ In the build-up to the east Asian crisis, the extent of unhedged foreign liabilities contracted by Indonesian firms was unknown and the level of South Korea's reserves was fuzzy.²¹

Better risk management: Effective risk management systems presuppose the existence of deep equity and bond markets, and regulators need to pay attention to evolving a suitable market microstructure which encompasses efficient price discovery and a liquid derivatives market. Governments have often tended to regard this as a second generation issue in capital

market reform and this has continued to keep markets illiquid. The development of liquid equity markets will also encourage larger overseas portfolio investments in equity. Bank and currency runs are essentially crises of debt markets, and a larger proportion of inflows in the form of investments in equity will reduce panic-driven runs, as equity markets are more self-correcting.²²

Capital controls: Controls can be imposed on inflows and on outflows. While the risks to emerging markets of an integrated global financial system have recently been strongly highlighted,²³ the gains need to be more clearly articulated. While the arguments supporting the welfare gains from the trade in goods may not hold for the trade in equities and bonds, what is critical is whether capital inflows lead to substantial long-run efficiency gains. There are two reasons for believing that it might: It enables the production base to be diversified, leading to the successful financial closure of projects in sectors such as technology and infrastructure, and thereby makes the output base of these economies less risky; and by helping to create a more complete set of equity and bond markets it provides for superior risk management and liquidity.

Controls on outflows are almost certainly unworkable, and will strongly deter inflows, unless the suspension of payments occurs during a financial crisis and is seen to be temporary, as discussed earlier. Instead, for highly indebted countries it would be preferable for governments to plan for an adequate level of liquid reserves in order to handle bunched repayments. Large short-term foreign liabilities need to be matched by large short-term foreign assets, and over time the foreign repayments schedule would need to be better spaced out.

A tax on capital inflows: The idea that capital inflows should be taxed is an old one.²⁴ The discouraging of short-term inflows into equity is common in many countries, through the higher taxation of short-term capital gains. It is the higher short-term taxation of debt flows which borrowing countries have hitherto been averse to. One exception is Chile which from 1992 to 1998 had an implicit tax on all non-equity capital inflows by requiring that another 30 per cent of such capital be placed as a one-year deposit, earning no interest. Despite this, capital inflows into Chile have been strong and Chile's short-term external debt reduced from 27 per cent to 11 per cent of its total external debt during this period. The cost of imposing such a tax is higher interest rates,

and the tax would clearly be recommended only when there is a surge of inflows and when persistent current account deficits do not exist. The argument may therefore not be generalisable to all emerging market borrowings. Lenders in international markets are also increasingly irked by such taxes, and markets strive to shift offshore to avoid such taxes. Chile's eventual discontinuance of its implicit tax was a recognition of this. Further, if tax rates are set modestly, currency traders are ready to pay the tax during a currency crisis in order to speedily exit from the currency, and the tax is then ineffective in preventing outflows.

Will wider overseas ownership help? One suggestion made is to encourage a wider overseas ownership of domestic bank branches, implying that bailout costs to the government would reduce.²⁵ This is among the more obscure arguments for increasing foreign ownership of the domestic banking system, and is unlikely to be persuasive. Further, there is an implicit bias in this statement that foreign-owned banks will lend more prudently, for otherwise if depositors in such banks are largely domestic, the multiple equilibria problem arising from panic cannot be wished away. While the fiscal management of the crisis may be easier, it will do little to mitigate the banking crisis, and if the foreign bank is reluctant to bail out depositors the pressure on the government to do so will be strong and the fiscal gains illusory. Typically, foreign ownership of banking systems has accelerated in the wake of banking crises, rather than as a policy response to preventing crises.

V

The New International Financial Architecture

New ideas are in the air about new institutions and rules to govern international capital flows. They range from the incremental (ensuring that there is better international crisis management) to the radical (a Bretton Woods II). In between lie a variety of institutional reforms to ensure that financial crises recede. Not all the proposals made seem feasible.

Many of the proposals have emanated as official policy statements incorporating regulatory ideas and governance structures. The US has proposed the creation of a contingency finance mechanism anchored to the IMF to extend credit lines to countries not yet experiencing a full-fledged crisis, but whose stability is potentially threatened. The UK government has proposed a permanent Standing Committee for Global Financial Regulation en-

compassing the World Bank, the IMF, the Basle Committee and other regulatory groups. The French have proposed authorising the Interim Committee of finance ministers of the IMF to exercise additional powers to deal with crises. The IMF has emphasised transparency, better disclosures, bailing in of private creditors and the consent of governments for the IMF to release sensitive country data on its own. The G-7 at its 1999 Cologne Summit established a consultative body called the Financial Stability Forum to identify areas where regulatory changes might be needed, without recommending the exact details of change. Proposals have also emanated from academics and investors. George Soros has proposed an international debt insurance corporation, Jeffrey Sachs an international bankruptcy court, and Henry Kaufman an international credit rating agency. We examine some of these suggestions below.

International deposit insurance: Depositor panic about the solvency of a bank, as in the multiple equilibria model, can clearly be avoided through deposit insurance. The extension of this model to cover overseas borrowings provides the rationale for international debt insurance. Soros' proposal for an international corporation to provide such insurance puts limits on the extent to which each country could borrow while remaining insured, and borrowings in excess of this would lack insurance. The customary moral hazard problems remain. Deposit insurance allows the borrowings to be raised at a lower interest rate than the risk of the portfolio would warrant; and banks continue to have an incentive to lend imprudently. Clearly also debt defaults on uninsured loans will keep alive the possibility of panic, though on a reduced scale. The setting of insurance limits will also be a politically contentious issue.

An international lender of last resort: This institutional device is seen as an alternative to international deposit insurance in the context of the multiple equilibria model, though the moral hazard problems remain. How deep would the pockets of the international lender have to be in relation to the financing packages which the IMF has put together in recent years? One study estimates that such a lender might need access to \$1 trillion, and that during the 20 years up to 1996 (and excluding the east Asian crisis) there have been 59 banking crashes in the world on which government bailouts cost 9 per cent of GDP in developed countries and 4 per cent of GDP in industrialised countries.²⁶ The moral hazard of bailouts has

clearly been expensive for governments.

Notwithstanding this it is possible to argue that the large financing packages in recent years do indicate that there has been a lender of last resort, except that it has not been explicit. For instance, the G-7 group of industrialised countries has been cast in this role, acting in concert with the IMF, and beginning with the \$50 billion financing package for Mexico. Making it explicit would help generate a larger resource base for such contingency financing, reduce country biases in the speed and size of the financial package, and provide for coherence and broad uniformity in such packages.²⁷ It would also make it possible to prequalify countries in terms of adherence to specified macro-economic and regulatory policy norms.²⁸ Finally, if the pockets are indeed deep, speculative attacks (as in the multiple equilibria model) would be successfully averted, and the contingency facility would then not be drawn. The danger in setting up such a mechanism, however, is that it could encourage imprudent lending by overseas creditors and more lax standards of supervision by domestic supervisors.

A world central bank: This proposal goes further and requires the issue of a world currency. It must be ruled out as infeasible, as the sharply differing fiscal positions of some governments imply that these countries will not benefit equally through a uniform monetary policy. The world is not an optimal currency area.²⁹

An international bankruptcy court: Bankruptcy laws differ significantly across countries and the purpose of an international bankruptcy court is to provide uniformity by giving an illiquid debtor time to sequence its repayments while continuing to remain in business.³⁰ In this sense, the court would provide for a temporary suspension of payments to creditors, thereby achieving a broadly similar objective of dampening panic as the other institutional mechanisms discussed above seek to do, and would write down the value of outstanding debt if the firm is judged to be insolvent. It also would not require extensive funding to be put together as in the case of the lender of last resort.³¹

For the bankruptcy court to be effective, however, it would need to be invested with powers to appoint receivers to seize assets, and administrators to manage firms. Most governments of developing countries will be unused to such enforcement powers being ceded to an overseas court, and in order for this to be feasible a major change would be needed in the manner in which some governments visualise the objectives of bankruptcy law. It appears more feasible

for common standards of bankruptcy law to be laid down, and for domestic laws to adopt them.

A global regulator: The idea of a global regulator is prompted by several factors: for banks the Basle Committee norms stipulate one set of uniform norms; for cross-border offerings IOSCO, the international federation of securities regulators, has also set common standards; and we now have a global regulator for trade in goods. While the enforcement of uniform norms for capital flows might be as problematic as in the case of banks, there is a deeper problem in that overly conservative global regulatory norms for international capital flows might shrink world markets for finance. Dissimilar national regulatory standards, coupled with differing tax laws, have in the past led to regulatory arbitrage and fuelled the growth of new financial markets which have competed successfully with the traditional markets and affected profoundly the ways in which firms can raise money.³² The issue is reminiscent of the literature on the problems of international macroeconomic co-ordination which could blunt international competition.³³

Bailing in: Bailouts raise moral hazard problems, prompting criticism that with each such bailout the probability of a succeeding crisis increases, contributing to more risky behaviour by borrowers, creditors and others. Thus it is argued that the Russian crisis was induced by the recklessness of overseas creditors, induced by the successful Mexican bailout. It has therefore been proposed that existing creditors should bail in the borrowers through a voluntary restructuring of debt. While overseas banks have rescheduled their debts in the wake of recent crises, it is bondholders who are now sought to be brought within this framework, and such a bailing in facility would then need to be explicitly written into bond contracts. The impact of this would be to make debt more expensive as creditors levy a suitable risk premium for bailing in. More radically, it could also impact on the way in which international finance has evolved in the last three decades, and lead to the gradual replacement of transactions related banking with a relationship mode of banking.³⁴

Self-supervision through subordinated debt: A weaker alternative is to introduce self-supervision within the banking system, by mandating each bank to issue subordinated debt to other banks, the yield on this debt being capped. Debt holders then face only a downside risk of losses, inducing them to be more vigilant about the performance of the banks whose debt they hold. While this could indeed

incentivise more prudent banking, it opens up questions of whether inter-bank competitiveness would then erode. It also appears more feasible to implement this across banks within a country, rather than internationally.

VI

Concluding Observations

Several of the grand schemes of re-architecting the international financial system are fraught with moral hazard and could thereby raise the probability of future crises occurring, although their immediate containment may be easier. This is apparent if one envisions a situation where the probability of a crisis is low but its impact if it occurs is high. Several re-architecting proposals are motivated by the need to lower the adverse impact, but thereby raise the probability of a future crisis. Bondholders in Russia in their recklessness are said to have taken comfort from the Mexican bailout. Proposals such as the IMF acting as an international lender of last resort or providing for international deposit insurance fall into this category. How then can the existing system be improved? Adopting the following two principles would help.

First, although several of the proposals have been mooted with the intention of facilitating financial crisis management, the new architecture ought to be concerned primarily with crisis prevention. Second, despite this when crises do occur the mechanisms to be deployed for crisis management ought to be those which do not have a moral hazard fallout by raising the probability of the next crisis.

Let us examine these principles in greater detail. While it is often argued that market stability during a crisis is a public good which ought to be fostered, international interventions to do so also generate external diseconomies across borders. Investment in this public good should therefore preferably be the responsibility of domestic regulators, and international interventions restricted to cases where these diseconomies are kept weak. There are clearly several incremental improvements in domestic regulation and supervision which have been discussed in Section IV which would assist countries in crisis prevention. Increasingly in several financial market segments, regulatory standards are being judged by their conformity to international rules of best practice. Tighter standards will impose more rigorous risk-management requirements on borrowers, creditors and investors, require faster and more accurate corporate disclosures, demand tighter accounting standards, and require Early Warning Systems to be set up to

forewarn of market weaknesses, and thereby make both the prediction and the management of future crises easier, without altering the fundamental character of the market or diluting its informational efficiency.

Not all governments will move towards these at the same pace and, where regulatory progress is tardy, countries will continue to risk vulnerability. As international governance structures are now being proposed in order that the pace of convergence is faster, it is preferable that changes are wrought by such international forums working through domestically executed institutional and supervisory measures rather than through the setting up of new international institutions. Illustratively, rather than create an international bankruptcy court it would be preferable to reform domestic bankruptcy laws. Even in countries where bankruptcy laws have remained unreformed, reform of the law is likely to be more feasible and acceptable than ceding authority for receivership, liquidation and change of management to an international body. How would the latter change the management of a government-owned enterprise?

The encouragement of liquid equity markets will also remove the debt bias which characterised financing in East Asia, and a deeper currency derivatives market will encourage overseas borrowings to be better hedged. Private contingency financing is a double-edged instrument. It is free of moral hazard and thus creates the right incentives whereby the creditor rather than the taxpayer takes the penalty during a crisis. But it will almost certainly be unacceptable in very liquid markets like the bond markets, as it would shrink liquidity to the point where the markets might cease to be transactions-related. The complexion of international bond markets will change if they are to become relationship oriented through the bailing in by bondholders. Informational efficiency is arguably the best insurance against episodic crashes, and if international bond markets become more illiquid they will also price financial assets less accurately and provide a poorer indicator of impending crises. The fuller implications of less liquid markets for the resource raising needs of firms will also need to be thought through.

The idea of taxing capital inflows has also received a fresh airing, and its appeal lies in curbing inflows when there is a surge. At other times it will be seen as uncompetitive unless tax rates are set low. And when they are so set they will very likely be powerless in preventing outflows during a crisis. The tax will be viewed as a small price to pay compared to the capital

loss in staying invested.

Despite these measures, crises will very likely continue to occur and will need to be managed. Crisis management measures would need to be built around such a framework without exacerbating future crises. Having a crisis manager in place would save precious time. A crisis manager will persuade existing creditors to maintain credit lines while equity and debt are restructured. This is clearly easier when the crisis has emanated from the actions of one institution (like LTCM) rather than when herding and contagion characterise the market, but the restoration of confidence in the latter case is also strongly dependent on successful crisis management. There will need to be international agreement on investing authority in a single organisation to co-ordinate the management of the crisis. Governance structures for this are yet to evolve.

Notes

[An earlier version of this paper was presented at the UNDP-Development Co-operation Forum Workshop on Asian Perspectives on Globalisation and Human Security held in Tokyo on August 5, 1999.]

- 1 See Kindleberger (1978).
- 2 Garber (1990).
- 3 See Obstfeld and Rogoff (1986) on sustainability, and Blanchard (1979) on rational bubbles.
- 4 It is easy to see that no trades can occur in a market with only information traders, as there would be no incentive to trade. Noise traders can make money at the expense of information traders over short time horizons as prices can diverge further from fundamental values during this period. The implications for financial markets of noise trading were first recognised by Black (1986), and the existence of noise constitutes a critique of the Efficient Markets Hypothesis.
- 5 Short-term commercial bank debts were not rolled over and an inflow of such credit of \$ 56 billion in 1996 was followed by an outflow of \$ 27 billion in 1997. In contrast, portfolio inflows in 1996 of \$ 12 billion were followed by outflows of \$ 4 billion in 1997. Credit inflows began rising from 1994, with about two-thirds of it originating from Europe and Japan where interest rates were low and were attracted by an expected pick-up in yield.
- 6 The model is based on the work of Diamond and Dybvig (1983), who drew upon earlier work by Bryant (1980).
- 7 Folkerts-Landau and Garber (1999).
- 8 In the Krugman (1979) model, speculators attack fixed exchange rate regimes, while in Salant and Henderson (1978) huffer stocks held to peg the real price of gold are attacked.
- 9 See Obstfeld (1995).
- 10 It was really only in Thailand that the current account deficit had soared, and had climbed to 7.9 per cent of GDP in 1996. In contrast the deficit that year was 3.3 per cent in Indonesia and 4.9 per cent in Malaysia and Korea, deficits which were regarded as

acceptable by financial markets. The Malaysian deficit was in fact down from 10 per cent the previous year.

- 11 At the end of 1997 the share of bank lending to the property sector varied between 40 and 55 per cent in Hong Kong, 30 and 40 per cent in Thailand, Malaysia and Singapore, and 25 and 30 per cent in Indonesia. The collapse of property prices enfeebled the banks. So did the collapse of the stock markets in Malaysia (where banks provided extensive credit against shares) and South Korea (where banks held substantial equities in companies). See Goldstein (1998).
- 12 Between 1988 and 1996, average interest expenses of the business sector as a proportion of GDP doubled in Indonesia, South Korea and Malaysia, and rose to 2.5 times in Thailand.
- 13 See McKinnon and Pill (1997).
- 14 See Krugman (1998b).
- 15 See Eichengreen (1999). Unlike in Mexico where the overseas liabilities were those of the government (through the *tesobonos*, which were dollar denominated bonds), in east Asia the liabilities were unhedged borrowings of banks and firms, and therefore of the private sector. Moral hazard, induced by investor perceptions of government behaviour, left the foreign borrowings unhedged.
- 16 The strategy of raising interest rates sharply worked in the case of Mexico in 1994 (up to 75 per cent) and Hong Kong in 1997. It did not work as rapidly in the case of Indonesia, Thailand and South Korea. The reason could be the high leverage of firms in these countries. Malaysia opted for capital controls.
- 17 Krugman (1998a).
- 18 Diamond and Dybvig (1983) show that the bank must know that it is seeing the start of a run, and temporary suspension is then a fully efficient mechanism for eliminating multiple equilibria. It can also be shown that this informational requirement on banks – that they have accurate information about the start of the run – can be relaxed in partial suspension schemes where progressively higher caps on withdrawal are imposed as the run occurs. Further, deposit insurance will not lead to superior outcomes unless the insurer has better information than the bank. These propositions are proved in Wallace (1988). Rogoff (1999) contains a discussion of these issues.
- 19 There are however plausible theoretical grounds for believing that it may not be detrimental. In multiperiod models of international borrowing, an efficient contract may not require full debt repayment in every state of nature, and when growth is unexpectedly low partial repayment may be optimal. See, for instance, Grossman and van Huyck (1988). Rogoff (1999), while drawing reference to this, concludes nevertheless that in imposing controls the problems may well outweigh the benefits.
- 20 The multiple equilibria problem can however be aggravated by too much disclosure. Morris and Shin (1998) develop a model to show that in currency attacks the absence of common knowledge about fundamentals can lead to a unique equilibrium.
- 21 Borensztein, Masson, Berg, Milesni-Ferretti and Pattillo (1999) contains an assessment of early warning system models which have been constructed in recent years.
- 22 Rogoff (1999) argues that there are three biases against equity: insurance for bank deposits, the tendency for industrialised

country-sponsored bailout packages to come to the rescue of overseas bondholders, and the stronger protection available to bondholders in bankruptcy courts.

- 23 See particularly Rodrik (1997) and Bhagwati (1998).
- 24 The Tohin (1978) tax is a tax on foreign exchange transactions.
- 25 Calomiris (1998).
- 26 Rogoff (1999).
- 27 The IMF's approach to recent financial crises has lacked uniformity. As *The Economist* (1999) observed, in Mexico investors were bailed out in return for tough macroeconomic policy changes which led to a severe recession but restored investor confidence; in east Asia the financing package was inadequate to bail out all investors, countries were advised to devalue their currencies, but the policy changes sought were equally tough, leading to a recession without immediately restoring investor confidence; in Russia the IMF endeavoured to maintain exchange rates, but the initial financing package was inadequate to restore confidence, leading to an eventual currency devaluation and a debt default which further reduced confidence, while in Brazil a large financing package to hoist reserves was sanctioned before panic arose in order to prevent a currency devaluation, but was unsuccessful as a domestic debt default occurred from a provincial to the federal government, signalling weakness in fiscal reform.
- 28 In late 1998 the idea of a contingency financing facility for the IMF was mooted, which would involve such prequalification, whereby countries with well regulated financial systems and in good standing would be eligible for the facility.
- 29 See Mundell (1961).
- 30 Protagorists of such a court typically have chapters 9 and 11 of the US bankruptcy laws in mind.
- 31 Sachs (1995) has suggested that the bankruptcy court should have powers to authorise the issue of senior debt for raising working capital, as this would help in keeping firms solvent while the process of a possible restructuring of their debts was under way.
- 32 Examples include the Euro-dollar market on account of US tax laws and the large market for trading in the Nikkei index futures in the Singapore market on account of the more restrictive regulatory requirements in Japan.
- 33 See Rogoff (1985).
- 34 Folkerts-Landau and Garber (1999) argue that several suggestions made within the spirit of the new international financial architecture which seek to move the financial system towards a relationship mode of banking will also set the financial system back one generation.

सत्यमेव जयते

National Institute of Financial Management

(A Govt. of India Society)

The National Institute of Financial Management is an Autonomous Institute of the Ministry of Finance, set up for the professional Training of Group 'A' Officers of the Central Accounts & Finance Services recruited through UPSC exam. The Institute also conducts Programmes for Senior Central and State Govt. Officers; Manager of Public and Private Sectors, as well as International Programmes funded by World Banks, ADB etc. The Institute is also expanding in the area of Research and Consultancy. The Institute requires highly motivated faculty members with outstanding academic records in following areas:

Area	PREFERRED SPECIALIZATIONS
Financial Management	: Corporate Finance, Capital Market, International Finance, Project Management.
Accounts	: Corporate Accounting, Cost & Management Accounting, Taxation & Company Law.
Govt. Finance	: Govt. Accounts, Public Audit, Public Finance, Budget and
Accounts & Audit	Expenditure, Contract Management Taxation Policy.
Computers	: MIS, Networking & Quantitative Techniques, ERP, Data Base Management System.

PROFESSOR (Rs. 18,400-22,400) & ASSOCIATE PROFESSOR (Rs. 12,000-16,500):

Qualification & Experience: Ph.D. or equivalent qualification in the relevant discipline with outstanding academic record. A minimum of 15/10 years of experience respectively in teaching/research in the universities/colleges recognized by UGC or in reputed Institute like IIM etc. Persons holding CA, ICWA, MBA with 15/10 years of working in Industry/Research/Govt./Semi Govt. Institution with proven track record of academic excellence are also eligible.

SENIOR LECTURERS (Rs. 10,000-15,200)

Qualification & Experience: Ist Class Post Graduate Degree in the relevant Discipline and 5 years of experience in teaching in the University/College recognized by UGC or in reputed Institute like IIMs. The above requirement can be relaxed in case of candidates having Ph.D. or otherwise excellent academic record.

Salary and other benefits: The Institute follows Central Govt. Pay Scale, DA, HRA & CCA.

Selected candidates are expected to stay in the campus of NIFM for which free residential accommodation may be available. Candidates staying outside the campus will be entitled for HRA of 30% on basic pay. The emoluments at the minimum of the pay scale including HRA will be around Rs. 30,900/- for Professor, Rs. 20,540/- for Assoc. Professor, and Rs. 17,300/- for Sr. Lecturers.

Person working in Central/State Govt./PSUs Govt. supported training Institutions who have proven academic credentials can be taken on deputation as per standard terms of Central Govt. deputation. They may, however, apply through proper channel with an advance copy.

Interested candidates may send their Bio-Data with details of education, age, experience, published work, details of present position, salary drawn and whether belonging to reserved category etc. within 3 weeks of publication. Applicants should superscribe on the application the discipline and the post applied for.

Application should be addressed to the Chief Administrative Officer, National Institute of Financial Management, Sector-48, Pali Road, Faridabad - 121 001 (Haryana).

Replication in Village-Level Studies

Paul Hockings

Village studies have long been done in India, either by British government personnel or by academics, particularly economic historians and social anthropologists. Some are highly quantitative, others rely more heavily on verbal description. In a relatively few cases the same village or set of villages has been restudied, and in one extreme case over a span of nearly 150 years. After briefly surveying some of the most useful of these longitudinal studies, the author describes in some detail his own 27-year study of a set of four Badaga villages in the Nilgiri Hills of Tamil Nadu. All were clustered together, but represented different phratries and social strata in this traditionally peasant millet-farming community of 1.60,000 people. Some conclusions are drawn about the nature of modernisation here, and evidence is produced to suggest that the process – which involves universal schooling, reduced fertility rates, television viewing, and changing attitudes towards the family itself – is having a levelling effect on these particular villages, with the one that would traditionally have been lowest in status now showing many progressive features.

LONGITUDINAL STUDIES

IN most sciences – medical ones, for example – it is axiomatic that one successful experiment does not amount to a discovery. The experiment, whatever it involves, must be subjected to replication by other scientists who try to maintain the same enviroing conditions in order to see if the previously reported results will be repeated.

In the social and historical sciences such a procedure might seem highly desirable, yet a true replication is always beyond the realm of possibility. An archaeologist who 'discovers' a site like Lothal and excavates it, will never be able to pull the same trick off a second time: either there are no more Lothals to be discovered because of the depredations of 4,000 years of coastal shift, rotting of materials, silting, etc; or there was never more than one major port city on the west coast of India during the Harappan era. The assiduous archaeologist might look hard for one, yet we can expect him, at the very best, to find something else.

Social anthropologists, who tend to deal mostly with 'soft', qualitative data in their village studies, are grudgingly aware that replication studies are beyond their reach. The village initially examined to meet the requirements of writing a PhD dissertation, for example, may still beckon long after the degree has been obtained. You have a nagging feeling that more could have been done, that not enough time was available to 'finish up', that newer developments in the discipline call for new questions to be asked in that place.

Things can come to a head if you make a casual revisit to the village; you are invited there for a wedding, let us suppose. Suddenly you, the so-well-informed ethnographer, realise that there were no TV satellite dishes here when you lived

here before; that the number of teashops seems to have mushroomed; that there are now one or two private nursery schools, and so on. What are you to do? Would it be worth restudying the village, and if so, to what end? Is it of theoretical importance to say that the village, which you perhaps described some years ago as a functioning, well-delimited social unit with clear structural features, now also has television viewing, nursery-school attendance, and no doubt other features that simply were not there before? And – if so – in terms of *what* theory? What have these various innovations done to the community you knew so well?

Replication studies are perhaps not a feasible way to proceed in ethnography, so we anthropologists do the next best thing, the village restudy. Some of us, anyway. No doubt the great majority of village studies in India, as in the rest of the world, stand on their own merits as historical isolates, un-rewritten, un-restudied. In effect the writers, by their very silence, have washed their hands of any obligation to do a follow-up study. Their one view of that village must stand for all time, regardless of what actually happens to the place later on.

The earliest village studies in India were all done by agricultural economists – people like H H Mann and Gilbert Slater – and of course, their Indian students too, some of whom continued the tradition with further restudies. Thus, much of the 20th century has been spanned for highly selected places; and in one case we have a restudy done near Pune which reaches all the way back to 1819 as its year of origin.

The long period of relative peace within India, and the generous welcome that the Indian public has always given to field-researchers, both foreign and home-grown,

go some way towards explaining the completion of quite a number of such longitudinal village studies in recent years. While the work of the agricultural economists continues, as for example in the book edited by Breman, Kloos and Saith (1997), we have also seen a number of restudies by anthropologists. This, in my view, is all to the good, because the anthropologists seem to take a usefully broader view of the relevant variables than do the economists. Agricultural economy is after all concerned with land tenure, prices, labour, crop patterns, supply and demand of goods and produce, urban markets, transportation, and so forth, without too much concern over the details of the local social structure. Caste is recognised, as it is virtually omnipresent; yet it is all too easily conflated into a simple, and sometimes a Marxist-derived, model of two or three agrarian 'classes'.

The last longitudinal work by social anthropologists has been done, perhaps not surprisingly, by several who have a solid grounding in development economics. One should here recall the study of two Tamil Nadu villages by Kathleen Gough, which spanned the years 1951-76, and was published in her 1981 and 1989 books. Even more impressive has been the fieldwork performance of Scarlett Epstein in two villages of southern Karnataka, in this case spanning a period of 40 years, beginning in 1954, and usefully pulled together in her three books [Epstein 1962, 1973; Epstein, Suriyanarayana and Thimmegowda 1998].

Beyond noting in passing that Gough and Epstein were both English ladies grounded in the structural-functionalism of the British school, there is something else very notable about their achievement; and that is that they finished what they set out to do – even if at the very outset their

long-term plans were not fully formulated. In other words, one individual with one particular social orientation carried through the entire longitudinal study from start to finish. Structures that they had identified in their earlier work could thus be followed to see in what sense they changed, or resisted change. Villagers who were personally known to the researchers revealed their changing roles until, in some cases, they died. Personal effort and social role thus become important components of these studies where, in earlier economic ones, there was little evidence of them. This is true of the Freed's study as well: Alan and Ruth Freed (1985) have done superb work over two decades (1958-1978) in a peri-urban village near Delhi.

For contrast we might look at two longitudinal studies that were not carried through by one researcher. One of them is more economic, the other more sociological in its approach. The former study, typical in many ways, was initiated in 1916 when Gilbert Slater became professor of economics at the University of Madras, and wanted to show his students something more than the textbooks. So he took them to the village of one of their classmates, and then required that each of them write a report on a village that was known to him personally (there were no female economics students then). As a result, *Some South Indian Villages* was published in 1918 (and Slater soon became head of the London School of Economics and Political Science; so far as I know, he never returned to India).

But this was by no means the end of the story. One of his students, from Kerala, decided to move from his own descriptive account of his village [in Slater 1918:123-45] to make a full book on a related one [Subbarama Aiyar 1925]. Then two other students, P J Thomas and K C Ramakrishnan, took the initiative of doing a full re-study of eight of the original villages in the Madras Presidency (published in 1940). Finally, Margaret Haswell, a British economist with an Indian assistant, decided to do a re-study in five of these same villages, as well as a re-study of one that F G Bailey had examined in Orissa in 1950s [Haswell 1967]. This is, to put it mildly, an impressive amount of work, and something that economic historians will long be able to make use of. But at the same time the study has what many would consider a weak point, namely that the same personnel were not involved at all stages in the long-drawn-out project. Worse, it would be misleading to assume that Slater, Thomas, Ramakrishnan and Haswell, all shared the

same theoretical models and assumptions about south Indian villages. At the same time, it could be misleading to read one of these studies without paying attention to the others.

Perhaps even more interesting, because of the time depth, is the Coats-Ghurye-Kolenda study of Lonikand, a village some 12 miles from Pune. Thomas Coats, a British officer, wrote a descriptive account of this place, with a certain amount of quantification, as long ago as 1819, making him a pioneer without parallel in rural sociology [Coats 1823]. The Indian sociologist, G S Ghurye, returned to Lonikand for a re-study which he entitled appropriately, *After a Century and a Quarter* (1960). Finally, an American anthropologist, Pauline Kolenda, did further fieldwork in the village for an article published in 1970. Here too we are confronted with a sequence of writers about the same place, each with a different background and a different agenda. If there is continuity in the descriptive accounts of three such writers (of three different nationalities), it is a continuity of place and environment, and to some considerable extent a continuity of caste affiliation there. History and geography are held constant in one sense, though of course they are not unchanging.

One could enlarge on these comments by looking at a number of other longitudinal studies produced in south Asia. They are outlined in Appendix II of my recent book [Hockings 1999:277-85].

In a suggestive essay about re-studies, Kloos (1997) puts his finger on some of the methodological problems inherent in such work – without, I might add, evolving a procedure that might avoid those problems. I take up some of his points here.

We have already glanced at the non-comparability of village studies in which different personnel with different research agendas pursue the 'same village' under study at different points in time. Of course, a given village is always the same one in a geographical sense, yet it might experience considerable change in a social or cultural sense. The later researcher(s) finds herself pulling out of the earlier study only those data which it is possible to 'up-date', those data which can still prove useful. In an extreme case, we find Thomas and Ramakrishnan using data from only eight of the villages that Slater's other students had examined, and then Haswell still later using data from only five of these villages.

Even if one and the same researcher follows the development of a village (or two) from the beginning to the end of a longitudinal study, there remains a question

of how well the anthropologist has been able to distance himself from the early phase of the study. As Kloos suggests, in such a situation we may well be confronted with a senior scholar whose career and reputation grew out of the initial study by (probably) the PhD candidate. Is he likely to be highly critical of his own early work if he now plans to build on it with a re-study [Kloos 1997:445]? Yet many of us continue to learn and grow intellectually during our careers, with the result that our approach to the re-study may seem to us 'better' than the initial study, simply because it is consonant with our current ideas. An outstanding case of this is Kathleen Gough's study of two villages in Tanjore (Thanjavur) district, Tamil Nadu which she began in 1951 when she was a young, Cambridge-trained, structural-functional anthropologist. Little more than a decade after this she became attracted to Marxist thinking, and this very obviously coloured her later research in those two villages and the subsequent books [Gough 1981, 1989].

In Gough's case, it may be noted, she used a great deal of quantification, and this made comparisons with the earlier study easier, or at least more concrete. One of the strengths of Coats's very early account of Lonikand (1823) is similarly that he provided later scholars with a good numerical description of the village, one that holds out real possibility of replication studies. The main difficulty with such quantification, in my view, is that the parameters of the study, even the administrative boundaries, can change unexpectedly between an earlier study and the later one. Subbarama Aiyar, for example, as an undergraduate student in Slater's economics class, described the 'administrative town' of Watakanchery in 1916 [Slater 1918:123-45]. Yet when he wrote his book in 1925, he tells us that he studied the village of Nelluvaya. Since both places are located in the same taluk of Talapilli, there are grounds to suppose (in the absence of a decent map of the area) that Nelluvaya (135 houses) was one of the constituent hamlets of Watakanchery (440 houses). Even so, without more information, the units of his two studies are non-comparable. In short, a longitudinal study pursued by one and the same anthropologist or economic historian may resolve some of the difficulties that arise when different scholars zero in on the same village at different points in time. Yet there are other methodological problems that still need a resolution.

Still unmentioned is the larger sampling problem that all village-level studies are

faced with: Is village G representative of the other villages in its taluka, and, if so, why and in what way? Is it representative of its region, even its state, and, if so, how is this possible? I need not elaborate on the sampling statistics. Although Mandelbaum in his *Society in India* (1970) made full use of all the available village studies at that time to portray regional variation in the social organisation of India and Pakistan, a critical reading of his sources would surely force us to conclude that many a studied village is really representative of nothing but itself. So, even when a before-and-after study ('two snapshots', as Kloos put it) has been completed, we are still left with the task or the quandary of explaining how that small piece of social history relates to the larger region.

THE NILGIRI SAMPLE

Let me now outline the methodology that was used to get around some of the problems just outlined, in my 27-year study of four villages on the Nilgiri Hills, Tamil Nadu [Hockings 1999]. All four villages were occupied exclusively by the Badaga community, so my study focused on that culture and not on one of multicasé villages.

With a total of about 440 villages and hamlets, located only on the Nilgiri Massif, one might suppose that a geometrically-based method of sampling might be appropriate in such a densely contiguous population (who today amount to about 1,60,000, I would think -- in the absence of census totals). The Badagas share the massif with the Todas and Kotas, two tiny tribal groups together totalling only about 3,000. All are substantially outnumbered by the hundreds of thousands of Tamilians, Kanarese and other recent settlers.

I did not use any statistically determined sample when I began my field study in 1962, but instead selected four Badaga villages near the centre of the Nilgiri Massif. To avoid some of the methodological problems arising from Kloos's 'two snapshots' -- namely, a certain lack of continuity between studies at two widely separated points in time -- in mid-1963, I did the first of four nine-yearly censuses of the four contiguous Badaga villages. They were chosen as 1 per cent sample of that community because they represent four hierarchically differentiated phratries, namely, Toreyas, Gaudas, Adikaris and Wodeyas (ranked here from lowest to highest). That they have been slightly more effective than average in the Badaga community when it comes to population control is suggested by my estimate that

in 1963 these four villages contained 0.983 per cent of the total Badaga population, whereas in 1990 this percentage was probably down to 0.937 -- and not because of emigration.

The purpose of these censuses was to produce a longitudinal database that would reflect, both statistically and qualitatively, the structural changes that have been occurring in Badaga households during recent times. No such controlled study of a comparable sample has been done anywhere in south Asia before, and the few longitudinal studies that do exist are, as I have indicated, mostly the work of different people with diverging interests. My censuses, taken in 1963, 1972, 1981 and 1990, cover essentially all persons (and not just a sample) living during the study period in these four nearby villages. Cumulatively, they are intended to cover one generation of cultural change, since a generation in this community is now 26 years (though it was shorter in earlier centuries).

For comparative purposes it also proved possible to use a complete set of the baptismal and death registers covering local Christian Badagas during the period 1860-1914, i.e. roughly a century prior to my own set of observations. These dealt with the entire Christian population of the immediate area, namely Ketti Pastorate and some outlying villages. The entries cover every case of Christian baptism and death there between 1860 and 1914, and indeed went on beyond that date down to the present (the later records, however, included numerous Christians who were not Badagas). Interestingly, these early observations record considerable detail on social status, whether the person was a Badaga or not, parentage of the newborn, place of residence, parents' occupation, probable cause of death, etc; and they thus allow me to extend my own observations backwards in time for a sample of the population quite comparable to my own, yet living a century earlier.

PROCEEDING ON OUR ROUTE

A generation prior to the first Badaga conversion in 1858, Captain Henry Harkness, the very first of a long stream of amateur ethnographers to puzzle over the Nilgiri communities, recorded the following comments about my sample area and his lodgings in 'Kaultray' (alias Katterri or Katery):

Proceeding on our route, we came to the village of Kaultray, situated among fields of ripening grain of almost every description. On the road we had been overtaken by a storm, which still continuing, and our

tenants not having come up, we were obliged to pass the night here, and to accommodate ourselves in the best way we could, in a Burgher [Badaga] verandah...

The inhabitants of this, and two or three other little villages at a short distance, consisted of some three or four families of Lingavants, about the same number of Arrvars, Kanacars, Adikaris, and common Burghers, and also a few families of Toriahs [i.e. Lingayats, Haruvats, Kanakkas, Adikaris, Badaga Gaudas, Toreyas - PH]. The surrounding scene showed them to be an industrious people; and as far as their notions could be made applicable to us, we found them hospitable. Small as the place was which we had for our evening accommodation, we were obliged to allow of the claims of the quern, the winnow, and the garner, to a share of it; and had we put up in the Toriah village, the distaff and the wheel... [Harkness 1832:111-12].

The four chosen villages are all at roughly the same elevation in the middle of the Nilgiri massif: O'ranayyi is at 6,550 ft, Kiy Odeyaratti at 6,590 ft, Ketti Torckeri at 6,650 ft and Hulla:da at 6,750 ft. All four had acquired electrification before my study began, but at that time only Ketti and Hulla:da had a serviceable road connecting them with the towns. Halfway through the study period the other two villages got improved roads and their first bus services. None of the four villages ever had a traditional fair connecting it with the wider region, although Hulla:da's annual firewalking festival does attract many itinerant traders and sightseers from other villages. Ketti has long had a small post and telegraph office, two more are within a mile, and the Ketti Valley has 126 telephone connections (1993) including 14 lines within Ketti itself. It is quite near the railway station which adjoins Hulla:da (which had another three phone lines). Other public facilities already in Ketti in 1961 included a co-operative society, a police station, a rural health centre, a veterinary dispensary, a maternity and child welfare centre, and a medical dispensary; there were two medical practitioners then. By contrast the two Lingayat villages of the sample, O'ranayyi and Kiy Odeyaratti, were at least two km away from any such facilities, only some of which were to be found in the nearby Katterri, Pala:da or Adigaratti villages. While these latter had a number of telephone lines and small post offices, there were none at all right in the two lingayat villages.

Evidently then the four villages had differential access to modern communications; but given that they lie so close together, within an area of scarcely

10 sq km, and are all inhabited by Badagas of various sorts, it would be legitimate to ask what cultural factors hold the four villages together? The answer is that there are specific juridical and ritual ties linking them, but no marital ones. Because I had chosen four villages representative of four different Badaga phratries there could not be inter-marriage, since (with minor exceptions that do not here apply) the phratry is definable as the largest endogamous unit within the total Badaga society [Hockings 1980:75].

The hamlet represents the lowest level and the commune the next higher level in a traditional Badaga hierarchy of politico-juridical units, each having headmen and councils. There are some calendrical ceremonies that may only be performed by the village head of a commune for all its constituent hamlets, in this case by Ke:ti or Sogatore. Such communal ceremonies normally include the God Festival (*devva habba*), the Great Festival (*dodda habba*), the harvesting festival (*ka:nike habba*), and in former times the costly memorial ceremony for an entire generation of the dead (*mane vale*), etc.

But there is another sort of ritual linkage between the four villages. Many of the Badaga villages have several kinds of priestly functionary. These (depending on the circumstances) may be (1) a member of the same phratry which inhabits that village; (2) a Ha:ruva man or boy; (3) an associate from a Kurumba tribe; and (4) a Wodeya Lingayat, Ke:ti commune, for example, makes use of all four types of priest (and I saw them all in operation there during 1963).

As we have seen, the four villages chosen for my study were no more than four kms distant from each other (the closest two being under one km apart) and they represented four stratified phratries of the Badaga society. By picking representative villages so close together in the centre of the Nilgiri massif I considered this would hold constant geographical and historical variables that otherwise might have gone some way towards explaining differences between any of the four villages located at a greater distance from each other; and it would also obviate any effects of being marginal to the area of Badaga settlement. Three of the four villages were actually within sight of each other, the fourth being hidden behind a hill. It was intended that any differences perceived between the four should be explainable as social differences and not environmentally induced ones or an effect of different historical circumstances.

However, the four villages did not only differ in their social ranking; another significant variable was their absolute size. Judged by number of households, the lowest-ranked Toreya village was also the smallest, having about two dozen households. The two high-status Lingayat villages were each more than twice as large as this; while the medially-ranked Gauda village was twice as large as these latter two.

THE CENSUSES

The 1981 Census of India did make it clear in numerous publications that it was looking at units called Buildings, Census Houses, Households, and Rooms on a nationwide basis. A Building in the Badaga case would however be, by the national definition, a whole row of adjoining houses, perhaps ten or more of them, each with its own entranceways and internal partitions. A Census House was defined nationally (in numerous official publications) as 'a building or part of a building having a separate main entrance from the road or common courtyard or staircase, etc, used or recognised as a separate unit. It may be occupied or vacant. It may be used for a residential or non-residential purpose or both.' I too was looking at such houses, each of which had one or two entrances. But it was the Census definition of Household which was most crucial, for here I could at least follow the idea in spirit if not in detail:

A household is a group of persons who commonly live together and would take their meals from a common kitchen unless the exigencies of work prevented any of them from doing so. There may be a household of persons related by blood or a household of unrelated persons or having a mix of both. Examples of unrelated households are boarding houses, messes, hostels, residential hotels, rescue homes, jails, ashrams, etc. These are called 'Institutional households'. There may be one-member households, two-member households or multi-member households. For census purposes, each one of these types is regarded as a 'Household'.

If a group of persons who are unrelated to each other live in a census house but do not have their meals from the common kitchen, they would not constitute an institutional household. Each such person should be treated as a separate household. The important link in finding out whether there is a household or not is a common kitchen.

My censuses did not encounter any of the 'Institutional Households'.

One aspect of the research design, which explains the unusual nine-year periodicity

of the censuses, was a desire to be able to link up my data conceptually with the national Census of India in one year, namely, 1981, when both it and my own census were to be taken. Thus, the work on the Badaga villages might not be statistically isolated from larger datasets. In the event, this strategy did not prove to be especially fruitful. My census was done a mere 2-3 months after the national operation, which could have made little difference to any statistical comparison. The problems lay rather with the units of analysis.

I was unable to guess that the Census of India officials would—erroneously, and contrary to all precedent—decide that the Badaga language, the one definite marker of Badaga ethnicity, should for the first time be considered as equivalent to Kannada, even though previously it had not been. Consequently, the 1981 and 1991 census publications gave no separate breakdowns for Badaga speakers but obscured them in the much larger category of Kannada speakers. This error has thus made it impossible for me to link my findings with those of the national census at many points where, in earlier years, it would have been possible, especially when there were separate enumerations for caste and tribe. In the final analysis, the failure to identify Badaga speakers as a national census category since 1971 has meant that I have largely been left to my own devices, with little leverage on the national data.

Each village itself has been historically the locus solely of Badaga residence. It may be noted here that the household, rather than the family, has been chosen as the unit of analysis throughout because, despite its many variations, it lends itself to direct and repeated observation in the field. The Badaga household is clearly definable because in every instance it inhabits one village house with one front door and one hearth; families may be more dispersed. My emphasis on the household as the primary unit for data collection in no way obscures the structure of the Badaga family. Indeed, that structure emerges from a comparison of the four sets of data from the four successive censuses of each particular household. Household types, according to my censuses, are quite varied and, although the nuclear family is the numerically dominant type and the extended family the ideal type, I identify many categories of household structure in the four villages under study.

MODERNISATION PROCESSES

My book (1999) was concerned very broadly with the recent development of Badaga society and of household life, and

it thus continues a story that was first set down in an earlier work, *Ancient Hindu Refugees: Badaga Social History, 1550-1975* [Hockings 1980].

I am aware that the term modernisation 'slips and slides, alludes and obtrudes' throughout this new book [Apthorpe 1989:532], but without definition. The term is often applied by development economists to government policy; but while modernisation has certainly been the gist of India's Planning Commission activities for some 50 years, my use of the term has been more cultural. I have viewed modernisation as a communication process wherein traditional peasant populations acquire and use more education and more information about the nation-state in which they live. As a result their orientations towards the outside world change, and their attitudes towards urban Indian culture raise new possibilities in their minds. Modern sports and 20th century forms of entertainment, pre-eminently television, cinema, and film music, have become very attractive. The films not only offer one a mental escape, but suggest new fashions in dressing, behaving, travel, housing, being employed, and relating to the opposite sex. A result of this exposure is urbanisation, a change in values which favours the employment, shopping, social life and general ambience associated with cities. Its practical effect has been a move to the towns by some of the most educated, most progressive, most employable and competent young and middle-aged people. The relative wealth of this new local elite or 'new middle class', if I may so designate it, has been invested in houses in town, equipment for those houses, private English-medium schooling for their children, cars and motorcycles, and modern styles of clothing and furniture. The change is certainly an irreversible process. This is not to say that everyone who wants to get modernised must move to a town, but they will adopt many of the urban-oriented values just referred to, even if still living in a village out of preference or necessity.

The modernisation of these people has been different from that of the western world, and indeed of other parts of India, for it has not been dependent on industrialisation so much as on the commercialisation of agriculture and plantations. Only a small minority of male Badagas in the sample villages have been working in local factories. Clearly modernisation means more than just getting a steady job in industry. It is participation in the mass media of the nation – viewing films frequently, reading newspapers and magazines, listening to radio or watching

TABLE 1: FACTORS LEADING TO A DEMOGRAPHIC TRANSITION

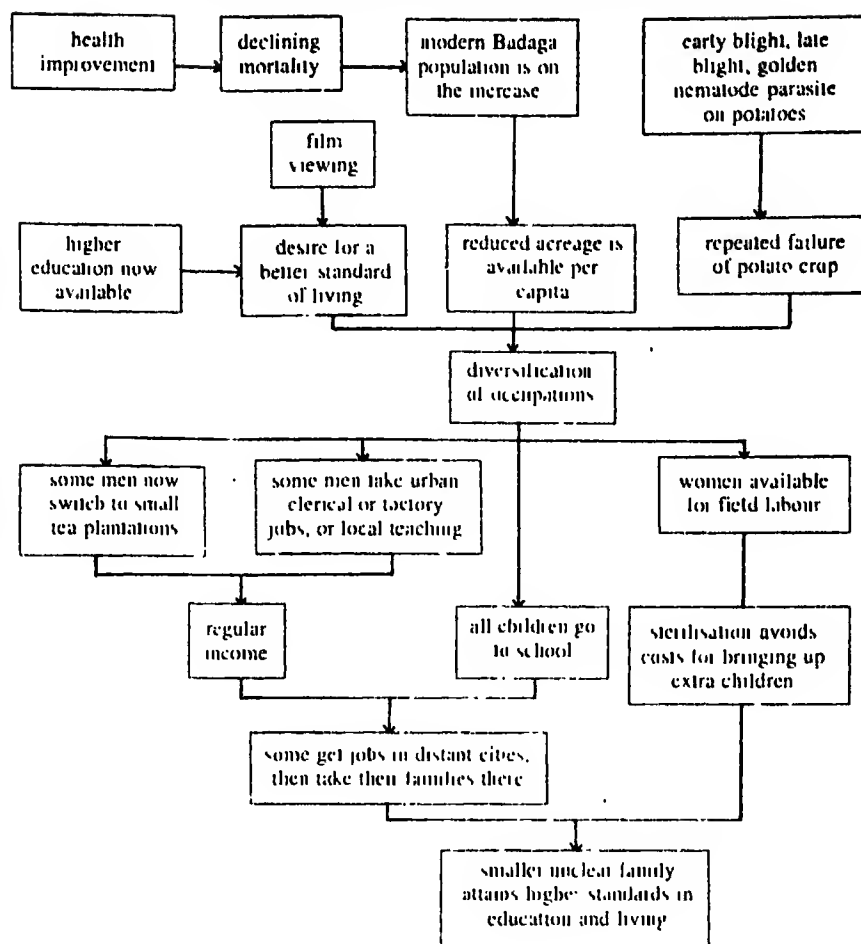

Table 2. Ranking of Four Villages on Certain Criteria Associated with Modernisation

	K. y Odeyanattu	Oraany	Hulla da	Ke n'lorekn
Communication factors (1990)				
Distance from town by road	2	1	4	3
No of years with village school	1	2	3	4
No of viewers per television set	1(159)*	2(104)	3(57)	4(49)
No of telephone lines in village	0	0	1(3)	2(14)
No of villages with marriage ties	2(17)	3(19)	4(47)	1(11)
Village-exogamous marriages	1(57.1)	4(99.2)	4(97.9)	4(98.0)
Population size (in 1990)				
No of households	3(65)	3(65)	4(127)	1(26)
Mean size of household	1(4.88)	2(4.77)	3(4.51)	4(3.77)
Percentage of nuclear households	3(82)	1(66)	3(82)	4(88)
Increase in no of households	4(132)	1(38)	3(74)	2(63)
Greatest longevity	4	3	1	1
Increase in absolute population	4(75)	3(46)	2(38)	1(26)
Fertility				
Masculinity ratio (1990)	3(0.8)	1(1.1)	2(0.9)	4(0.7)
Child-woman ratio (1990)	4(204)	1(407)	4(204)	2(355)
Reduction of the child-woman ratio	4(66)	1(20)	3(60)	2(36)
Generation length (1963-1990)	2(26.0)	3(26.7)	1(24.5)	2(27.4)
No of fertile years, younger women	1(11.5)	3(8.2)	4(7.9)	2(9.4)
Years reduction from older women	1(2.0)	3(6.9)	4(8.3)	2(2.7)
No of items of rank 4	5	1	7	7
No of items of rank 3	3	7	6	1
No of items of rank 2	3	3	2	6
No of items of rank 1	6	6	3	4
Ranking score (r)	41	37	53	47

Notes * Rank order is given first, then particular values are in parentheses. Square brackets are percentages.

television. It is attaining a sufficient level of education to obtain 'white collar' urban (and preferably government) employment and, in the case of young women, to attract a well-employed groom. And it is shopping in town or visiting, even studying in, modern cities.

These aspects of modernisation turn the eyes of the youth away from farm-work, which is easily seen today as dirty, tedious, unrewarding and low-status. In the Nilgiris, tea is at least a better prospect than traditional agriculture, if a family owns some land, and it can then produce green leaf with the labour of cheaply hired pluckers rather than family members. Whether tea or vegetables are grown, the demonstrably shrinking landholdings do not require the numbers of family workers that they employed in previous generations. This fact, when combined with the shortage of good urban jobs, the high costs of bringing up children, and the receding need to produce extra sons to replace those who might die in childhood, goes a long way towards explaining the much reduced fertility over the past generation among the Badagas. All of these factors were certainly understood by the Badaga womenfolk – whether educated or not, and they did something about the situation.

Long-available school education, and recent participatory use of several mass media, have combined to propel the Badaga community towards modernisation. While men tend to have more education, more urban contacts, and greater multilingualism – as is true throughout most of Asia – it is the slightly schooled body of Badaga women who in 1963 (according to my survey) saw India's future lying in industrialisation: who have opted for modern medical practices; and who, by agreeing to sterilisation after one or two children, have over the past two decades begun to take control of their fertility and hence play a more central role in the future of their families. Any development worker or public health official who thinks that in a patrilineal society it is the males who will always be 'in control' of attitudes and developments should take note of this finding.

The effects of this recent change have been widespread in Badaga society. The child-woman ratio has dropped appreciably, and with lower fertility and lower infant mortality the toll on women's health has lessened and their life expectancy increased. A partial switch from potatoes and other farm crops to tea has also had a similar effect, by much reducing the number of days that Badaga women would be labouring in their fields. With fewer

children per family, college education has become more accessible to teenagers, especially as several undergraduate colleges were opened in the Nilgiris during the course of this study. The employment, lifestyle, and longevity prospects of the younger generation thus look brighter than they ever did before.

HOUSEHOLD ECONOMICS

How can we generalise from the Badaga case? Following from Leibenstein's work (1957, 1975), an economic theory of population decline has been developed which is generally called the cost-benefit approach. Its central assumption is that parents recognise that they derive some utility from their children (as a kind of consumer goods, as producers, and as old-age insurance); but also that they incur costs for the children. A principle thus emerges which balances the benefits, which generally decrease with economic improvement, against the costs which regularly increase. This principle qualifies the desired number of children.

Bahniskha Ghosh has usefully summarised household economics approach to the family that was proposed by an American economist:

T. W. Schultz (1974) has noted four interrelated developments: (i) investment in human capital that treats children as a form of capital in which parents make investments and derive future satisfactions; (ii) allocation of human time in decisions with respect to market and non-market activities where bearing and caring for a child are highly labour-intensive activities for the mother; (iii) the household production function that treats market goods and household time as inputs in the production of the true object of utility within the family; and (iv) treatment of the family as the decision making unit with regard to both consumption and household production of goods and services including children. The dominant characteristic of this approach is the treatment of time of the members of the family as a scarce resource, the implicit value of which ultimately determines the point of equilibrium for the family's decision-making process [Ghosh 1990:20].

If the central concern of economics is the allocation of scarce resources among competing ends so as to maximise utility, then the household with which my recent study grapples is an economic microcosm in the sense that it is the locus of decision-making over generations, concerning forms of investment of time and income and the production and rearing of children. Even the organisation of the funeral is changing in response to the economic exigencies

and time constrictions of the modern household and its employment pattern. So far as declining fertility is concerned,

The new home economics has been successfully used to explain the phenomenon of demographic transition. A decline in infant mortality would have inverse repercussions on desired family size since parents would be expected to derive greater satisfaction the longer a child survives, thus generating greater demand for children.

However, at the same time, a decline in child mortality, raises the costs of 'child quantity' relative to 'child quality'. The net effect not only depends on the production conditions within the household but also on the perceived importance of child quantity relative to child quality, and as such needs to be diagnosed through empirical applications of the new home economics [Ghosh 1990:21].

Is this the mechanism by which Badagas have recently been shifting from a *Gemeinschaft* to a *Gesellschaft* type of society [Tonnie 1957:248-49]? We can see in Table 1 the beginnings of the demographic transition among the Badagas, but should use caution in reading that table.

It would be tempting to explain these changes as a demographic sequence whereby one demographic change compelled another. It is probably true that declining mortality has to a considerable extent allowed fertility decline and to a lesser extent the rise in the age at female marriage, but in neither case has it been the cause. The truth seems to be that a range of demographic changes occurred at much the same time neither because of close interrelation nor because of coincidence, but because they are all products of massive social and economic changes during the last half-century [Caldwell et al 1988:255].

Caldwell (1982) rejected the universality of the demographic transition, but focused on the differential value of children. On the basis of research he had done in West Africa, he postulated that an examination of wealth flow within the family is critical for understanding the value accorded to children at any given time. He observed African tribesmen to prefer more children in their families since benefits flowed from children to their parents, especially the elderly. Thus, so long as the labour of children and their support of the parents remains possible, the value of sons remains high and so does fertility. Badaga proverbs were quite clear about the traditional demographic situation: 'If a girl is born she's useless; if a boy is born he's an asset' [Hockings 1988:148, no 154a]. But one

was not enough: 'Is one eye an eye? Is a single son a son?' [Hockings 1988:149, no 157a]. Also, 'Girls are a disappointment, but the eldest son [is like a] hearth' [Hockings 1988:151, no 162]. Some proverbs extolled the joint family: e.g., 'Who has been spoilt by living in a joint [family]? Who has flourished after partition [of the family property]?' [Hockings 1988:340, no 656a]. No doubt all peasant societies cherished such attitudes: an ancient Chinese writer, for example, advised, 'Raise sons for old age, pile up grain for times of famine' (*Yang er fang lao; ji lian wei huang*). With the Badagas, such attitudes are now past; and the direction of vertical flow of care and services within the household has recently reversed itself, from upwards to downwards.

Namboodiri systematised Caldwell's ideas about wealth flow in a series of hypotheses (1986): (1) it is only if the family becomes nucleated that fertility will decline; (2) industrialisation is not a necessary precondition for fertility decline; (3) fertility decline starts with the reversal of direction of the inter-generational wealth flow, which in all traditional peasant societies has been from the younger to the older generation. All three features have been found true of recent Badaga household life, now that their hallowed attitudes about the family have altered. Many sons were called for when there was high infant mortality, and everyone worked on the land; but no longer. One Indian study concluded ominously that in order to achieve a 95 per cent probability of having one son survive to adulthood, a couple would need to produce six children [May and Heer 1968].

The Badaga village economies have not been industrialised, in part, because local farming does not lend itself to mechanisation in the way that it had to in the vast tracts of Australia, the US, Canada, the Ukraine, Russia and Argentina that fed the newly developing countries of the west. There will be no great growth of machinery sales and repair shops in an area of small landholdings like the Nilgiris. Even tea, the main plantation crop, which is now harvested by machine on flat land in Japan, will continue for long to be plucked by human labour on the Nilgiri Hills (just as it is in China and Assam). It makes no economic sense to bring in costly machinery when labour remains so readily and cheaply available, and wholesale tea prices so depressed. But one can use cheap cooly (non-Badaga) labour, without involving one's wife and sons in the tedious fieldwork of a small tea plantation.

A change in values about household organisation and size is not just a response to changing economic conditions, but is an acknowledgement that the quality of life today is different. Thus, generalising from his African study (done just prior to the Karnataka one, 1988), Caldwell wrote:

From the demographic viewpoint, the most important social exports (from western Europe) have been the concept of the predominance of the nuclear family with its strong conjugal tie and the concept of concentrating concern and expenditure on one's children. The latter does not automatically follow from the former, although it is likely to follow continuing westernisation; but the latter must be preceded by the former [Caldwell 1976:356].

In this regard, following from the discussion of mission schooling in my book, one must ponder whether the example of the German, Swiss, British and westernised Indian (missionary and schoolteacher) families in the Ketti Valley area in the last century already suggested an alternative approach to child raising for local Badagas; it was certainly very visible. I conclude that these people became a significant reference group and avenue for modernisation, though without prompting mass conversions: barely 4 per cent of Badagas are Christian today.

CONCLUSIONS

My original purpose in choosing four sample villages located within a tiny, confined historico-geographical zone yet containing four different phratries was to hold environmental factors constant and find out what cultural effects were manifested in the vital data. An answer should now be sought. One way of doing so might be to rank the four Badaga villages in terms of their response to certain salient features of modernisation; from most traditional (1) to most modernising (4) in Table 2.

This is without question a somewhat impressionistic way of evaluating degrees of modernisation. The items listed on the left of the table are not independent variables but to a considerable extent entail each other and are reflections of the same things, population growth and modernisation. Nonetheless, several significant conclusions may be drawn from this ranking, even though it does not permit of sophisticated statistical analysis.

(1) Ranking is different for five of the six 'communication' factors tabulated, suggesting there is no strong correlation between accessibility of schooling, accessibility of a town, number of villages with which there are marriage ties, amount

of village exogamy, whether there are telephones, and the possibility of television viewing.

(2) Certain rankings are correlated; thus number of viewers per television set correlates with mean size of household and number of years the village has had a school: the lower the increase in the village population, the larger the mean household size, and the greater the number of people per television set.

(3) The greater the percentage increase in the number of households in a village (1963-1990), the greater is the percentage reduction in the child-woman ratio.

(4) The masculinity ratio, which should be lower where female children have better survival rates, is inversely correlated with the percentage of nuclear households in a village: the higher the percentage of nuclear households, the lower the masculinity ratio.

(5) On questions of fertility reduction, we find that the lower the child-woman ratio, the lower the number of fertile years of the younger women (born since 1930), the greater the reduction in those fertile years as compared with the older women (born before that date), and the greater the number of villages with which they have marital ties.

(6) Overall – and rather impressionistically – I conclude that O:ra:na:yi is perhaps the most conservative or traditional of the four villages; yet it is no less modernised than the other Lingayat village, Ki:y Odeyaratti. Both lacked telephone service and had fewer television sets in 1990. To some extent the degree of modernisation of each village is in inverse proportion to its traditional social ranking. The result is that large Gauda village scores highest, while the 'minority groups' all score lower, and the two Lingayat villages – highest in social status – rank lowest of all. The Toreya village, traditionally considered as lowest, ranked quite high on the scale. If one considers only the factors headed 'fertility', the ranking is the same. This implies that modernisation entails a process of social levelling. Is the end of caste differentiation in sight?

THE MYTH OF COMMUNITY

Gender Issues in Participatory Development
Edited by IRENE GUIJT and MEERA KAUL SHAH
with a foreword by ROBERT CHAMBERS

The Myth of Community provides many insights into how women can be involved more equitably and appropriately in participatory processes, and how gender issues can be tackled more meaningfully. The contributors discuss the crucial role played by conceptual clarity, appropriate methods and methodologies, and supportive organizations and institutional structures. The book provides theoretical reflections on participation and gender; practical experiences from Asia, Africa, Latin America, and the Caribbean; and examples of how organizations are attempting to integrate gender-sensitive work in participatory processes.

EMPOWERING WOMEN

An Alternative Strategy
from Rural India
SAKUNTALA NARASIMHAN

This immensely insightful book emphasises the need for bringing about an attitudinal change among women as the most important step towards empowerment. Dr Narasimhan focuses specifically on rural Scheduled Caste and Scheduled Tribe women, who, she says, are triply disadvantaged as women, as members of the rural section of the populace and because of their low-caste status. This pioneering book compares the effectiveness of state initiatives with the motivation-and-conscientization strategy applied by AWARE (Action for Welfare and Awakening in Rural Environment), a non-governmental development organization working in 6,000 villages spread over seven states in India.

Fiscal Federalism

Towards an Appropriate VAT System for a Federal Economy

S Gurumurthi

The paper analyses the current division of responsibility between the centre and the states with regard to commodity taxation in its historical perspective and the efforts initiated during the last 15 years to introduce the VAT in place of union excise duties at the central and the sales taxes at the state levels. It offers an alternative VAT model for India based on certain principles applicable also to other federal economies planning to introduce the VAT.

The politics of the time is going towards fragmentation, while the economics is towards integration.

— Paul Kennedy

SEVERAL federal countries – Argentina, Austria, Brazil, Canada, Columbia, the Federal Republic of Germany, and Mexico – levy a VAT. The VATs of Argentina, Austria, Germany and Mexico, are all centrally-controlled with revenue-sharing arrangements between the federal and provincial governments. It has been the experience that the VAT in a federal economy presents several difficult issues, which have their repercussions on the sensitive federal-state political relations. That the only three OECD countries which still have not switched over to the VAT – Australia, Switzerland and the US – are all federations is also significant. While there do not seem to be any legal proscriptions against the federal government adopting a VAT despite the fact that to date general sales taxes have typically been the domain of the states, there could be difficulties in administering a federal VAT in conjunction with the states' retail sales tax systems (RSTs). The simplest solution, according to Tait (1988), is to entrust the administration and collection of the VAT either with the states or with the federal government and then use a formula to share the revenue between the central government and the states. If this is unacceptable owing to the loss of fiscal autonomy, then a federal VAT might have a state VAT 'piggybacked' on it. Tait holds that as a model for other federal countries, the German VAT illustrates the need for agreed federal and state legislation on base, structure, and rates and once established, the formula for splitting the proceeds may be the most clear and least contentious method of revenue distribution. He, however, hastens to add that even the limited flexibility in recent years (1987-88) of the federal-state split from 68/32 to about 70/30 in Germany was not achieved without considerable disagreement and concludes that in a federal system

where the states try to retain more discretion over their own exemptions, rates, and revenues, the system would not work. While the system may be working satisfactorily in Germany, it should be appreciated that fiscal federalism issues still stand in the way of a smooth switch over to a national VAT even in an industrial country like Canada, not to speak of the problems associated with introduction of the VAT in developing country federations.

This paper analyses the current division of responsibility between the centre and the states in India with regard to commodity taxation in its historical perspective and the efforts initiated during the last 15 years to introduce the VAT in the place of union excise duties at the central and sales taxes at the state levels and offers an alternative VAT model for India based on certain principles which are applicable to other federal economies which would like to introduce the VAT. The paper is organised in four sections. Section I describes the evolution of the current system of commodity taxation in India. Section II deals with the incidence of indirect taxes in India. Section III covers the various measures taken to reform the system of commodity taxation during the last 30 years. Section IV presents an alternative model of VAT for India, though the principles on which it is formulated apply in equal measure to other federal economies as well.

I

Commodity Taxation: Historical Perspective

In the field of commodity taxation, the Constitution of India has assigned the powers of customs and excise taxation to the central government with the exception of excise on alcoholic liquor, while the states have been given the powers of sales taxation. It is necessary to elaborate the nature and import of these two levies, namely, the union excise duty by the centre and the sales tax by the states. While there is no essential difference between the two

from the angle of incidence on the consumer, it has to be recognised that the two taxes are neither identical nor interchangeable and that there are some basic differences between the two different levies.

In the first place, an excise is a levy at the production point whereas a sales tax is levied on a commodity at one or more points of sale or purchase between the stages of production and final consumption. If there is only one stage at which any particular commodity completes its production process, the incidence of an excise duty should theoretically be only at one point. Since, however, the component parts of the commodity could have themselves been subject to excise duty, an excise duty on the final product could in practice involve a multiple duty on the components unless the duty is based on the value added components only. It was with a view to eliminate cascading in the incidence of excise duty that the government of India introduced the MODVAT some time in 1985. The MODVAT has been dealt with in detail later in this paper. In the case of sales, the same commodity might pass through various stages of sales, making itself susceptible to sales tax at more than one point, depending upon the system of the sales tax levy. While an excise duty ends at the production point and does not take into account, even indirectly, elements of cost that are incurred after the production stage, namely, freight, insurance, distribution charges and the like, a sales tax is on a much more comprehensive concept of cost and touches not merely the cost at the production point, but also subsequent elements including profits and the excise duty itself.

The excise duty in India, being a union levy, does not differentiate between one region and another and is uniform throughout the country while the sales tax structure and the rates of sales taxes differ from state to state. Again, while most of the excise duties are specific, sales tax are ad valorem levies with the result that during a period of high inflation, the sales tax yield automatically goes up, other things

remaining the same. In certain countries where excise duties are exclusively reserved for the centre, the levy of sales tax by states has been held to be unconstitutional on the ground that they are substantially the same as excise duties. Similarly the question has also been raised whether the *ad valorem* excise duties are not really sales taxes. Despite all these similarities, both taxes have "distinguishing features" and both have "a positive place in a comprehensive system of taxation and are expressly mentioned in our Constitution" [Gol 1965].

During the last 50 years, union excise duties and state sales taxes have expanded substantially exhibiting phenomenal growth and buoyancy. In 1950-51, the aggregate yield from the two levies was roughly Rs 1,280 million, representing 1.3 per cent of the national income during that year. By 1963-64, this figure went up to Rs 9,980 million, accounting for 5.8 per cent of the national income. By 1989-90, it rose to Rs 3,74,660 million accounting for 10.57 per cent of the national income. Among the tax receipts of the union government, the excise receipts occupy the most dominant position and account for 43 per cent of the total tax receipts of the centre as compared to 16.3 per cent during 1950-51. Taking all the states together, the yield from state sales taxes in 1950-51 was around Rs 600 million, accounting for 27.5 per cent of the aggregate state taxes. During 1991-92, the sales tax revenue represented around 54 per cent of the total yield from state taxes. In the structure of the state finances, the position of sales taxes is broadly similar to union excise duties in the case of the union finances, though the relative importance of the sales tax differs from state to state. Sales tax is the single largest source of revenue to almost every state in India, accounting for about 60 to 70 per cent of the states' own tax revenue in the case of several states. That the share of sales taxes in the total revenue of the centre and the states has increased from 12 per cent in 1960-61 to about 21 per cent at present bears eloquent testimony to the growing importance of this tax. As a percentage of the total tax revenue of the states including their share in central taxes, the share of sales tax increased from 26 per cent in 1960-61 to around 38.5 per cent in 1989-90. Most of the states levy tax on raw materials as well as other inputs. Sequel to the amendment to the Constitution in 1982, sales tax has become leviable on work contracts, hire purchases and leases. Among the various incentives offered by the state governments to encourage growth

of industries, sales tax concessions either as deferrals or concessional rates are quite significant. Such concessional rates of sales tax or exemptions are available for small scale and tiny industries in nine states and medium and large industries in twelve states. In addition to the general sales tax, another peculiar feature of the Indian fiscal system is that interstate sales are also liable to be taxed by the states of origin. Despite a ceiling of 4 per cent for the rate of Central Sales Tax (CST) laid down by parliament, tax export on account of this tax is substantial: while, on an average, nearly 18 per cent of the states' sales tax revenue is accounted for by the CST, the shares of certain individual states are quite high: West Bengal (35.2 per cent), Haryana (33.9 per cent), Maharashtra (28.3 per cent), Madhya Pradesh (23 per cent), Punjab (22.6 per cent), Karnataka (20 per cent) and Tamil Nadu (12.8 per cent). The origin of the CST and the need to do away with this tax have been dealt with in Section III.

An important feature of the Indian sales tax system is that sales taxes are applied extensively at the first stage of the sale in any state – a phenomenon which has contributed to the maximum amount of cascading as the first point sales tax is levied *ad valorem* on the price of a commodity that includes the excise duty paid into the central exchequer at the last point of its manufacture. Though this is somewhat similar to the practice in Canada, the element of cascading in Canada is not that large as the provincial sales taxes in that country are on retail sales only. Another peculiar feature of the Indian sales tax system is that while the sales tax is leviable on all commodities inclusive of inputs and capital goods, services are excluded owing to the constitutional limitations. These characteristics have contributed to "complexity, lack of transparency, distortions in economic decisions and inequities in interjurisdictional division of tax bases. It is increasingly felt that these problems cannot be solved without harmonisation" [Bagchi 1997].

II

Incidence of Indirect Taxes

A study carried out by the National Institute of Public Finance and Policy, New Delhi as late as 1994 made the following observation about commodity taxation in India [see Bagchi 1997a].

The system (of domestic trade taxes) that is operating at present is archaic, irrational and complex – according to knowledgeable experts, the most complex in the world. It interferes with the free play

of market forces and competition, causes economic distortions, and entails high costs of compliance and administration.

In this connection, the findings of a study of indirect taxes in India conducted by Pawan K Aggarwal from the National Institute of Public Finance and Policy, New Delhi are quite significant. The study, covering the incidence of major indirect taxes, both central and the state taxes, attempts to estimate effective tax rates of major commodity taxes in India for the fiscal year 1989-90. The major findings of the study are as follows [Aggarwal 1998]:

(i) The total effective rate of taxes varied between 3-40 per cent for most commodities; (ii) For essential commodities, the rate varied between 3-12 per cent; (iii) The effective tax rate for services like construction, electricity and transport was about 10 per cent; (iv) On an average, sales tax accounted for the highest burden, exceeding 5 percentage points of the effective tax rate; union excise duty and customs duty accounted far less than 5 percentage points; countervailing duty generally did not account for more than 1 percentage point, reflecting the availability of tax credit against the MODVAT; (v) Effective tax rates reflected substantial input taxation, more than 30 per cent of the total for most commodities, and even 100 per cent for iron ore and some services; (vi) Even though services were not taxed directly, the 10 per cent effective tax rate on them mentioned above was due to input taxation; (vii) While the contribution of sales tax in input taxation was the highest, the contribution of union excise duty was also quite substantial, followed by the contribution of customs duty. The contribution of countervailing duty, however, was rather low; (viii) Tax incidence on consumers in rural areas (11 per cent) was slightly lower than in urban areas (12 per cent); (ix) While the distribution of the burden of indirect taxes was progressive in both rural and urban areas, it was more pronounced in rural areas; the distribution of the burden of individual tax components was also progressive; and (x) The effective rate on food items was lower than on non-food items; that on cereals was lower than on other food items.

The major conclusions of the study have been summarised below:

(i) Given the high incidence of input taxation, there was an imperative need to reduce the same. It was expected that this would be achieved as the coverage of MODVAT was expanded; (ii) Given the high incidence of input taxation, the states should also move to a credit mechanism

in their respective sales tax structures; (iii) A VAT rate of 4 per cent on cereals and pulses would be equivalent to their current tax burden from the sales tax. For many other products, the equivalent VAT rate would be 14 per cent.

III Reform Efforts

The first effort toward reform of the system of commodity taxation in India was taken in 1965 when the Fourth Finance Commission was given a term of reference by the Government of India to measure the combined incidence of the union excise duties and state sales taxes and the effect of their incidence on production, consumption or export of the commodities taxed, examine the possibility of determining the proportion that the combined money burden of union excise duties and sales taxes bore to the sale price of each commodity. The Fourth Finance Commission found that even this limited study bristled with several difficulties: while excise duties were mostly in terms of specific rates, sales taxes, being ad valorem levies, created the problem of converting the excise rates to ad valorem rates. "For the same commodity, excise rates differed for different categories, whereas in the case of sales tax there was no such differentiation in general" [Gol 1965]. Further there was so much diversity in the system of sales tax levy from one state to another that the question of bringing them to a uniform scale was a job in itself.

The commission noted that wherever the sales tax rates were on the basis of a single-point levy, the problem was simple while these rates were in terms of multi-point, double-point or a combination of various systems, the conversion of these levies into single-point rates created several problems. The commission also observed that the total incidence of the excise duty and sales taxes on manufactured commodities might also have to include the incidence of excise duty and sales tax on their components: the determination of this multiple incidence was not always easy. The commission found that the states were not in a position to furnish data regarding the total value of sales and total sales tax collections under each item. Had this data been made available, the problem of converting other levies into single-point levies might have been far easier, the commission felt. For these reasons, the commission found it difficult to pursue even the limited study of the proportion that the money burden bore to the price in each excisable commodity.

Even if the commission were able to determine the proportion that the money burden of the two taxes bore to the total price of a commodity, it might not have taken them far in relation to the main task before them since the commission had to assess the effect that money burden had on production, consumption or export of a commodity while the factor of taxation had a bearing on the price of a commodity and in the commission's view, this was no more than "one out of a host of important factors". According to the commission, unless they were in a position to undertake for each excisable item detailed cost-analysis studies of the type that were usually undertaken by the Tariff Commission, they would not be able to determine whether its production, consumption or export was being hampered on account of the excessive burden of either these two taxes or some other factors. In order to recommend any ceilings on sales taxes, the commission had not only to determine the combined incidence of the two taxes but also the separate incidence of each. The commission observed that even if data were available, it would be "analytically impossible to be precise about the effect of one or two variables when the number of variables was so large" with the result the commission found itself unable to undertake these detailed studies.

Certain states had represented before the commission that in judging the reasonableness of the restraint that a tax imposed on production and consumption, one had to keep several factors in mind: in the case of certain commodities it might well be the objective of the government policy to limit the growth of consumption and production and in the case of such commodities, no corrective action was called for. If the combined incidence of the two levies went to inhibit consumption of essential consumer items to the detriment of the living standards, corrective action had to be taken. Similarly, if taxation had an inhibiting effect on the production of intermediate and capital goods, it was definitely a matter for concern. Apart from the quantum of the tax there was also the manner of imposition and collection. If the taxes were levied or collected in a manner which would stand in the way of the efficient organisation and development of industry – if it would prevent the diversification or location of industry on rational lines or the organisation of procurement of raw materials or distribution of products in the most economic manner – there was a case for overhaul of the taxation scheme. In the

then prevailing situation this question was also important from the point of view of promotion of exports. Most states had assured the commission that so far this aspect was concerned, they themselves were very conscious of the need for exports and were devising suitable adjustments in sales tax levies with a view to reducing any disincentive effect that the sales taxes might have on exports.

With these observations, the Fourth Finance Commission proceeded to examine the manner in which better co-ordination between union excise duties and sales taxes levied by the states could be brought about. All the states had conceded the point that "unrestricted and un-coordinated taxation might affect production as well as exports and there was need for coordination between the tax policies of the union and the states". As to whether this co-ordination could be achieved through a system of ceilings on sales tax rates on certain commodities, combined with a financial sanction in the form of the possibility of a cut in the state's share out of union excise duties in case a state exceeded the ceilings, was a matter on which the states had expressed strong views.

The states drew the attention of the Finance Commission to the fact that "sales tax was the only elastic source of revenue left with them and any attempt to place restrictions on their freedom in this field of taxation would affect their capacity to raise resources and thus handicap them in relation to the requirements of the Fourth Five-Year Plan. Sales tax was essentially of regional application and was almost the only major fiscal instrument left with them for shaping their economic and industrial policy." The commission noted that the states had been using sales tax along with power tariffs for giving incentive to industry and trade and any dilution of their power in this respect would mean a setback to their efforts for encouraging the growth of industry and trade within their respective areas. It was felt that any ceiling on sales tax rates determined by the Finance Commission for a period of five years would remove the element of flexibility from the taxation system of the states and would "cut at the very root of the principle of states' autonomy, thereby, weakening the federal structure". It had also been contended that the "mechanism of adjustments in the share out of an item of devolution, depending on the observance of specified conditions by the states, might well be inconsistent with the constitutional provisions regarding sharing of taxes".

While union excise duties were not compulsorily divisible as per the constitutional provisions, it was argued that once a tax was made divisible according to a certain formula, it had acquired all the elements of a devolution item and any conditions imposed on the sharing scheme might not be legally valid. It had also been pointed out that the "linking of the shares of excise duties with the rates of sales taxes might run counter to the principles that a Finance Commission might decide for distributing excise duties". Certain states had expressed the view that between sales taxes and union excise duties, it was the latter category of levies, which in the case of the most of the commodities, imposed a higher money burden. According to them, if at all any restrictions were necessary, the proper course would be to place ceilings on excise duties. The Finance Commission noted that out of the 68 items which were then figuring on the excise list, the problem of co-ordination between excises and sales taxes did not arise in 19 items, accounting for 45 per cent of the aggregate excise revenue. Eight of these items, namely, cotton fabrics, silk fabrics, woollen fabrics, sugar, tobacco (unmanufactured), cigars and cigarettes had been exempt from the levy of sales tax under the scheme of additional excise duties in lieu of sales tax. In respect of four other items common to excise and sales tax lists, namely, cotton yarn, jute, steel ingots and pig iron, there was already a ceiling of 2 per cent on sales tax rates under the Central Sales Tax Act, 1956. Then there were certain other items known as 'special goods' in respect of which all the states were then uniformly levying a sales tax at the rate of 10 per cent. In fact the suggestion for this uniform levy had come from the central government and the states had accepted it. There were in all 15 items in this category out of which seven items, namely, motor vehicles, tyres and tubes, cycles and parts thereof, refrigerators and air-conditioners, wireless receiving sets, gramophones and certain iron and steel products were then in the excise list. In the case of these items, no upward revision had been envisaged in the near future, at any rate, since the then prevailing rates had been fixed in consultation with the centre, in future also the revision would be effected after mutual consultations. Thus out of 68 commodities, it was in the case of 49 commodities that the question of co-ordination between excise and sales tax arose. The states' view generally was that if on a proper study of the facts, it was found that in the case of a few selected items out of these 49, a

co-ordinated tax policy was called for. According to them, however, the proper course for such co-ordination was 'not the mechanism of a financial sanction in the form of reduction in the share out of a devolution item but a periodic exchange of views between the union and the states on problems of taxation and related subjects with a view to evolving coordinated lines of action.

It had been pointed out to the commission that there was no need to resort to a scheme of linking the share out of union excise duties with sales tax as the then existing powers with the union government under Article 286 (3) of the Constitution together with Section 14 of the Central Sales Tax Act, 1956 were adequate for controlling the upper limit of sales taxes in the case of such items as might be deemed to be of special importance. If such action was necessary and the states agreed, the union government could further enlarge the existing list, after providing for compensation to the states for loss of revenue rather than resort to a financial sanction of the type contemplated in the term of reference. Certain states had argued that a scheme of ceilings on sales tax rates would be inequitable as between industrially and commercially advanced states with a fairly large urban sector and the states which were predominantly agricultural. In the case of the former, the sales tax yield occupied a much more pivotal position in their finances than in the latter: if ceilings were imposed their finances would be more adversely affected than the finances of agricultural states. As against this argument, the commercially backward states had argued that the sales tax revenue on interstate sales accruing to the advanced states was largely paid by consumers in other states and that in the distribution of central sales tax – a source of revenue which the central government should have distributed on some equitable basis, the backward states had been discriminated against under the then existing arrangements according to which each state kept what it collected on behalf of the central government.

In view of the fact that adequate data for determining the combined incidence of the two taxes and their economic effects were not available, the commission could not proceed to the next stage, namely, that of fixing the ceiling and devising a formula for adjustment in the share out of the excises did not arise. The procedure for framing a scheme of ceilings on sales tax rates and for its implementation should be the same as in the case of additional

excise duties in lieu of sales tax. Both could be evolved by mutual agreement: their successful functioning again depended on mutual understanding. In view of what has been explained above, the commission did not recommend any scheme of ceilings on the sales tax rates of any of the excisable commodities and the question of suggesting a formula for adjustments in the share of the states out of union excise duties did not therefore arise. While the exchange of views between the states and the Finance Commission summarised in the above paragraphs gives a flavour of the reaction of the states to such issues affecting centre-state financial relations, it is important to keep the above observations and recommendations of the Fourth Finance Commission as a backdrop for the alternative model of VAT proposed in Section IV of this paper.

CENTRAL SALES TAX

In the foregoing paragraphs, mention was made about the central sales tax. This needs some explanation. The Taxation Enquiry Commission (TEC) of 1953-54, after studying the problems of the operation of the sales tax with respect to interstate sales of goods, recommended that a new law should be enacted for authorising the levy of a tax on interstate sales subject to a ceiling of 1 per cent, which the states would administer and also retain the revenue. In making this recommendation, the commission had rejected the principle underlying the then existing constitutional provisions relating to interstate trade taxation, namely, that sale of goods should be taxed only by the state where the goods are consumed, or the state of 'destination', and not by the exporting state or the state of 'origin'. As observed by Bagchi, it is a pity that the TEC, while recognising the role of the centre in regulating the tax on interstate trade, did not adhere to the logic which it had itself expounded in the matter of taxation of cross-border sales to unregistered dealers, namely, that the bulk of the revenue from such an origin-based tax should be passed on to the importing states.

Following the recommendations of the TEC, the Constitution was amended in 1956 to provide for the levy of the central sales tax (CST). Currently the CST stands at 4 per cent. Besides the inequity in tax base sharing, the trading community is obliged to pay the CST at several stages in respect of the components of a product manufactured in more than one state before their assembly. In order to avoid this, several business houses resort to the practice of setting up several branches with a view to get the parts as 'branch transfer'.

This phenomenon has prompted the states and the centre to contemplate levy of a consignment tax on which no agreement has been reached for the last 15 years. If India were to go in for the VAT in its true letter and spirit, there can be two opinions regarding dispensing with the Central Sales Tax.

VAT AND MODVAT

In order to minimise the cascading effects of excise taxation of inputs, the government of India, in 1985, introduced a modified form of excise duty called the MODVAT. Shome (1997) points out that unlike in almost all countries which have introduced the VAT – where the conversion of a turnover tax regime into a VAT was preceded by a year or longer of administrative preparation, computerisation and taxpayer education – in India the process has been one of iteration towards a VAT, both in terms of tax structure and tax administration. For example, the credit mechanism was introduced for a few commodities at the beginning, and its coverage was slowly extended to other commodities. In the following two or three years, the MODVAT was extended to cover practically all chapters of the central excise tariff except petroleum products, textile products, tobacco, cinematographic films and matches. This practice, according to Shome, is quite different from the usual model of including all goods under the VAT with a few exemptions and excluding small businesses under a threshold based on turnover. The fact, however, remains that MODVAT is not a value added tax in the real sense of the term: "The so-called Indian MODVAT is not a VAT at all, but rather a form of modified excise duty. The MODVAT is essentially manufacturing excise tax with credit allowed for excise duty and customs in a limited number of industries, introduced mainly with a view to eliminate the cascading effect of multi-point excise levies" [Tait 1988:30].

It is also necessary to know the background in which the MODVAT scheme was formulated. Chakraborty noted three measures attempted earlier for containing the inflationary impact on account of the excise taxation system: (i) In the production of an excised commodity, inputs belonging to Tariff Item 68 were rendered eligible for set-off. (ii) Within each tariff item the duty paid on inputs within the same item was made available as proforma credit. (iii) For several excised commodities provision was made for duty relief for specified inputs.

It was, however, found that this approach of selective concessions coupled with exemptions granted through more than 500 notifications had only led to several complications in tax administration. Due to the predominance of sales tax as the single most important source of revenue for most of the states, any assessment of the distribution of the tax burden among different sections of society had become extremely difficult. It was in this context that the MODVAT was formulated "as a theoretically appealing way of providing set-offs for taxation of inputs." The L K Jha Committee on Indirect Taxes (1978) had also recommended the levy of such a tax on manufactured goods. However, it has to be recognised that "as long as credit is given only for excise duty and additional duty customs paid for inputs and not for general customs duty, relief in the MODVAT would not be available to certain category of producers like automobile manufacturers who depend largely on imported goods".

Under the MODVAT scheme, union excise duties on most manufacturing goods have been converted to incorporate a credit mechanism for taxes paid on inputs. Apart from reduction in the number of tax rates, credit is available for tax on raw materials as well as capital goods. Further the earlier requirement of matching inputs with particular outputs has been eliminated. Shome (1997:8-12) distinguishes the following features about the Indian MODVAT system:

(i) It is the general experience that whenever a cascading domestic consumption tax structure is converted into a VAT which essentially allows input tax to be credited, a revenue neutral VAT rate is calculated and introduced. While this has happened in most countries which have gone in for the VAT, and has necessarily implied an increase in the tax rate on the end product since crediting of input tax implies a decline in revenue at least in the short run, in the case of India, however, crediting of input taxes has been introduced *pari passu* with a scaling back of end product tax rates over the last decade.

(ii) When a production-type VAT, with crediting only of raw material tax and not of capital goods tax, is converted into a consumption-type VAT with crediting of all input tax, including on capital goods, the change typically takes place over 3-5 years as in the case of Columbia and Turkey. In India, however, it was a once-for-all change in 1994-95, followed by a broader interpretation of the application of rules in 1995-96.

(iii) The removal of the matching re-

quirement of inputs with outputs for crediting purposes starting from 1995-96 would have a negative impact on the MODVAT revenue.

(iv) Though the number of rates was brought down to twelve in the 1997-98 budget, the tax structure is still replete with multiple rates and exemptions, making the MODVAT administration relatively difficult, necessitating detailed cross-checks which are strenuous to pursue.

(v) Although credit is given for taxes paid on capital goods, the post-tax price of capital goods is used for the calculation of production value for tax purposes at the next stage. This continues the cascading element in the MODVAT.

(vi) Interpretation of what is a creditable capital good is based on a positive rather than a negative list, leading to representations from industry and delays in receiving credit.

(vii) While most countries which have introduced the VAT with only a few rates typically also have a few excise taxes levied on the value of production rather than on the value added such as on petroleum products, tobacco products and alcoholic drinks and sometimes even on electronic gadgets and white goods, in India, the transformation process of the excise structure into the MODVAT has almost eliminated the traditional excises. This, according to Shome, partially explains why the excises suffer from multiple rates, since higher rates are necessary for otherwise traditional excises.

(viii) Services have been neglected from inclusion in the VAT base. While powers to levy tax on certain services like entertainment and advertisements, other than in newspapers or the electronic media, are conferred on the states, the centre has started taxing the services sector by invoking its residuary powers under the Constitution. Bagchi has rightly pointed out that the criterion of 'neutrality' requires that services be brought under taxation through the VAT and not in the form of a stand-alone tax. Since service providers operate mostly at the retail level, it would neither be practical nor possible to bring it within the ambit of a manufacturer level VAT like the MODVAT.

Since the MODVAT has not been followed up by a similar system at the state level in sales taxation, the MODVAT could at best be viewed only as a step towards adoption of a full-fledged VAT in India and not a VAT in itself, while introduction of a full-fledged VAT in India would seem to present "numerous administrative and constitutional difficulties, including the

vexed question of union-state relations" [Tait 1988:30]. It should also be recognised that the prevailing sales tax system in India is based on the origin principle which allows the retention of revenue in the producing state. As pointed out by Shome (1997:15), a switch-over to the destination principle which would allow revenue to accrue to the consuming state and would approximate the central principle that the vat should be a consumption tax, would be difficult to introduce in India since several industrial states might stand to lose revenue.

In the wake of liberalisation, tax reform is one of the key elements of the economic reform process in India. The Tax Reforms Committee (TRC), headed by Rajah J Chelliah, in its Interim Report (1991), observed that it would be ideal if one comprehensive VAT could replace the present system of central excise, states' sales taxes and other indirect taxes except the state levy on alcoholic liquor and the state entertainment tax. However, it is the translation of this theory into practice in the context of fiscal federalism as it operates in India, makes it an extremely difficult and delicate task. International experience has shown that a successful implementation of the VAT will require determination of the VAT rates by the centre and that a centrally determined VAT should replace the cascading turnover sales tax levied by states. It goes without saying that introduction of the VAT in India is almost impossible as the states would not be willing to give up even part of their exclusive powers of sales taxation. Further it would be a Herculean task to convince the states about the superiority of the VAT over the first-point sales taxes because whatever experience the states so far have had in such matters cannot be considered satisfactory to lure them into a value added tax system. For example, in pursuance of an agreement reached between the centre and the states at a meeting of the National Development Council in December 1956, it had been decided that the centre would levy additional excise duties on cotton fabrics, woollen fabrics, rayon or artificial silk fabrics, sugar and tobacco in lieu of sales tax on the commodities earlier levied by the states with the states agreeing to abolish sales tax on these commodities. Under this tax-rental arrangement, the entire net proceeds from the additional excise duties in lieu of sales tax are to be distributed to the states on the basis of recommendations of the Finance Commission every five years. States have expressed their unhappiness with this arrangement both

with regard to the method of its implementation by the centre and the scheme of redistribution recommended by the Finance Commissions.

While the Ninth Finance Commission was given a term of reference to examine the possibility of merging additional excise duties in lieu of sales tax with basic excise duties, not only were the states unanimous in opposing the proposal but the Finance Commission also strongly recommended against any such move. The commission found that much of the opposition against the proposed merger could be traced to the manner in which the tax rental arrangement was being implemented by the centre. For instance, it had been decided at a meeting of the National Development Council as early as in December 1970 that within a period of two to three years the proceeds from additional duties of excise in lieu of sales tax should achieve a level of 10.8 per cent of the value of clearances and the ratio between the yields from basic duties of excise and additional excise duties on these commodities was intended to be brought up to 2:1. The commission noted that while the latter commitment was fulfilled in recent years, the former one which was required to be done within three years of the meeting of the National Development Council in 1970, still remained to be realised. Apart from the fact that the government of India did not fulfil its promises with regard to realisation from this levy, it had unduly expanded the coverage of the goods by resorting to definitional changes precluding thereby more items from the levy of sales tax and many commodities were also subjected to 'nil' rate of duty. These commodities, therefore, were free not merely from the levy of additional duties of excise but also escaped the liability to sales tax which the states were prevented from imposing for fear of forfeiting their share in the proceeds from additional duties of excise. The Ninth Finance Commission not only did not recommend the merger of additional duties of excise with basic duties of excise, but also proposed that the revenue loss suffered by the states on account of the exemption of additional duties in lieu of sales tax allowed by the central government should be estimated. The National Institute of Public Finance and Policy (NIPFP) which was entrusted with this responsibility found that states were losing revenue on account of exemptions in the case of khandasari sugar, certain items of textiles like rubberised textiles, knitted or crocheted fabrics and fabrics of man-made materials coated or filamented with preparation of LDPE. The NIPFP

study established that the centre had increasingly mobilised revenue from yarn and the raw materials of yarn through empirical evidence for the decline in yield from the basic excise duties on fabrics and increase in the yield from yarn. The NIPFP study had strongly recommended that the divisible pool of the additional excise duties in lieu of sales tax should take into account the central tax base of raw materials, yarn and fabrics lest the centre should derive exclusive benefit from the base. Several states have also expressed their reservations regarding the economic criteria selected by the Finance Commissions for the horizontal redistribution of the proceeds from the additional excised duties in lieu of sales tax among the states. While many states have favoured sales tax collections in the respective states as the basis of redistribution, the adoption of criteria like net state domestic product and adoption of the 1981 population figures by the Ninth Finance Commission as against the 1971 population figures stipulated in the terms of reference have left several states dissatisfied with the scheme of redistribution too. Going by such experience, it should not be surprising if states view any move to introduce the VAT at the national level not merely as an attempt to encroach upon their exclusive powers of sales taxation but could even question the alleged superiority of the VAT over the sales tax system.

Earlier in the paper, it was stated that the VAT could also be looked upon as a multi-stage tax which produces a burden equivalent to that of a single stage retail sales tax. That it is the first point turnover sales tax which causes the maximum amount of cascading in the absence of any provision to give set-off for the tax paid at production point in the form of either excise or MODVAT both of which are central levies is fundamental to any attempt at a design for a national VAT for India. In most of the states, sales tax is levied mainly at the first point known as the single point sales tax. The tax is thus collected from the importers, manufacturers or the wholesalers. The only states still having multi-point tax on a few commodities are Karnataka and Kerala.

The TRC, in its final report, recommended an admixture of the VAT, namely, MODVAT at the centre extending to most commodities and rationalising sales tax system at the state level. It recommended that a value added tax, namely, the reformed central excise system, should be extended to the wholesale stage, wholesale stage being defined as traders who buy from manufacturers and sell to other

manufacturers or traders. The TRC observed that they should be subject to the VAT in addition to excises payable by the manufacturer and that only the value added at their hands should be subject to tax and the manufacturers who buy from these wholesalers should also be able to obtain credit for the tax paid earlier. According to the committee, this would provide adequate safeguard against the attempts at undervaluation by the manufacturer to reduce excise liability which is the cause of many disputes in excise besides capturing the value added at the hands of the wholesalers. The TRC recommended that the VAT at the wholesale stage could be collected by the states' sales tax department concerned in close co-operation with the officers of the central excise department and the amount of the VAT collected could be allowed to be retained by the state where it is collected: "This central VAT can be levied with the co-operation of the states who can be persuaded to accept this levy, because their own right to levy the sales tax on goods will no way be circumscribed, and at the same time, they will get the entire revenue from the VAT at the wholesale stage" [Gol 1992].

The above recommendation of the TRC should be appreciated in the context that the first-point sales tax is of a cascading type and no credit is available to the wholesaler for the excise or MODVAT already paid since the states cannot be expected to give credit for a tax paid into the central exchequer. In this connection, it needs to be mentioned that the moment a product leaves the manufacturing point after completion of the production process in all respects, the central excise duty regime ends and all subsequent transactions should only be deemed to be sales and they can be subject only to sales taxes and not to any form of central excise duty like a central VAT although this might be collected and retained by the states as per the recommendation of the TRC. This particular recommendation of the TRC therefore is not sustainable as per the existing constitutional provisions. Further, it should also be recognised that nearly 80 per cent of the sales tax revenues of the states come from excisable commodities. This will give an idea of not only the dimensions of the cascading involved in the first-point sales taxation and the problem of introducing a true value added tax devoid of any cascading element. It is true that several states like Andhra Pradesh, Kerala, and West Bengal have introduced the credit principle on a diverse set of commodities, particularly inputs for manufacture, following the MODVAT scheme

of the central government. Maharashtra state was the first one in India to take a bold initiative to introduce a VAT in its true spirit covering the entire spectrum of manufacturing and trading in the state. Besides extending relief for manufacturing inputs, the intermediate dealers, namely those selling goods purchased from registered dealers, called 're-sellers', who were not liable to pay sales tax have also been brought within the purview of the VAT in Maharashtra. Bagchi, who recently undertook a study of the operation of the VAT in Maharashtra, is highly appreciative of the bold steps taken by the state in pushing through the VAT despite the risks involved for revenue growth [Bagchi 1997]. Preparations for the possible introduction of the VAT on a wider scale are going on in Delhi, Karnataka, Madhya Pradesh and Tamil Nadu in the form of training officials and feasibility studies. Nevertheless, the VAT, in its true spirit, cannot be realised in India unless a lasting solution is found for removing the cascading element in the first-point sale taxation.

Another fundamental issue to be addressed is the question of commodity taxation at two levels, the central/federal and the provincial, in large countries. While a VAT is levied best at the national level, after a study of the experience of Canada, Bagchi has concluded that the above option is not open to a federation where the subnational governments derive a major portion of their tax revenue from the sales tax. Bagchi goes on to make the following sweeping observation, of course on justifiable grounds: "What comes out loud and clear from the Canadian experience is that domestic taxation of commodities at two levels cannot be carried on entirely independently" [NIPFP 1994]. This is the same view expressed by other experts like Bird who have held that no country has yet been able to work out a satisfactory way of operating sales taxes independently at two levels of government [Bird 1994]. Bagchi suggests a concurrent VAT at two levels of government, namely, both the centre and the states, but integrated in the sense that the base will be laid down at the national level while allowing the states to fix the rates. The states could have flexibility in determining their base too but departures from the national base should be kept to the very minimum and decided in consultation with the centre. A study by the NIPFP (1994) recommended a manufacturer's VAT and the centre and state sales taxes converted into a destination-based VAT as an interim solution.

Burgess, Howes and Stern (1993), while conceding the fact that international ex-

perience with the VATs in federations reveals widespread usage of central VATs, with collection by states under the supervision of the centre and revenue-sharing, feel that it is difficult to avoid the conclusion that, from the point of view of federal politics, this option is a non-starter for India. According to them, the alternative would be to have the centre reducing rather than expanding its role in indirect taxation. Under this option, the centre would retain only a small number of high revenue-yielding excises and the states would then administer their own VATs to replace the current system of sales taxes and to replace union excises on many goods. According to these authors, the option of a system of state VATs is likely to be politically attractive to the states since most of the states could be expected to prefer to collect the tax revenue themselves rather than be dependent on the centre. Pointing out that the proposal to make the VAT a state tax would be at odds with the prescriptions that the central MODVAT should be further developed and that the centre should assist the states with the transition from sales tax to the VAT, the authors clarify that in their view, the state-run system of VATs could only be considered a long-term option and that 'in the short run, a dual VAT is almost certainly the only way forward in the development of value added taxation in India' [Burgess, Howes and Stern 1993].

The above recommendations suffer from certain shortcomings apart from practical difficulties in their being implemented. In the first place, the authors have proposed this model drawing parallel to a similar proposal under consideration in Brazil at that time. Brazil, however, as observed by Norregaard (1997), besides offering an example of a VAT assignment system that is generally believed to have had detrimental effects on economic performance, also provides empirical evidence of the difficulties of co-ordinating and administering a VAT levied at the subnational level, with the state level VAT on interstate transactions being levied on an origin basis at a lower rate than on transactions within the state, giving rise to significant distortions and administrative difficulties. All three levels of government are assigned taxing powers on consumption, but with different tax systems, and with the tax covering the widest base, the VAT-type ICMS assigned to state governments and not to the federal government. Further, a large fraction of the federal government consumption tax (the IPI) is transferred to lower levels of government under a tax-sharing arrangement. This particular

design is believed to encourage tax competition between entities of government and to foster tax evasion, which is further exacerbated by a large number of tax rates and exemptions. Some of the shortcomings of the ICMS were eliminated in 1996 through a major tax reform. Following the 1996 reform, which zero-rated all exports and introduced a credit for capital goods, the federal government has proposed a more comprehensive reform, which would replace the present ICMS and IPI with both a federal and a state level VAT, levied on the same tax base and at homogeneous rates for interstate as well as intra-state transactions. It has also been proposed that this tax should be levied on a destination basis. Although the proposed mechanism, as pointed out by Ter-Minassian, is in principle compatible with different arrangements for the sharing of revenues among the states, any move from the current origin principle is bound to have a significant impact on the distribution across the states of their major revenue source, entailing losses for states that are net exporters to the rest of the country and gains for those that are net importers. Expressing serious doubts on mustering the political consensus required for the constitutional amendment needed to achieve this objective, Ter-Minassian (1997) recommends that a more practical solution would be to replace the existing system of sales and excise taxes with a more standard VAT with a single rate or two rates, levied at the federal level on a broad base including services, with the proceeds shared with the states and municipalities on a derivation basis, and complemented by a narrow range of excises.

Secondly, the model of Burgess and others envisages that in return for decentralising the system of VATs to states, the centre might also be able to negotiate a number of binding agreements with the states in relation to the harmonisation of bases and the simplification of rate structures. Further they have proposed that agreement of the states to submit to a central, though possibly state-controlled, regulatory tax agency would also be desirable.

In the light of the history of fiscal relations between the centre and the states elaborated in the foregoing pages, it is highly doubtful whether these recommendations would be acceptable to the states and even if there is broad agreement among major states, harmonisation of the rates and uniformity in application may remain a distant dream. Further, even the authors conclude that while the combination of

central excises, state VATs and an end to vertical revenue sharing would only be long-term option, a dual VAT in the short run is inevitable [Burgess, Howes and Stern 1993].

IV Alternative Model

There is a broad consensus in the literature on fiscal federalism that the VATs are appropriately assigned to the central level of government. This dictum, according to Norregaard, rests on the fairly extensive administrative capabilities required to operate the tax, a requirement that is generally best met by central governments in combination with the need to make the VAT neutral with respect to the spatial allocation of production and consumption, implying that – generally – the VAT should conform to the destination principle [Norregaard 1997:65-66]. Further, a subnational VAT system would pose problems with regard to which provinces or states should receive the revenues from the VAT on imports, and which should bear the burden of the VAT refunds on exports. Following this kind of reasoning, Norregaard concludes that comprehensive VATs should be left solely with the national governments. Further experience with federations, particularly large federations at that, has shown that any system which involves commodity taxation at two levels, namely, federal and provincial, cannot ensure implementation of the VAT in its true spirit. In this connection it is necessary to study the recent developments in the European Union and Canada, which represent a major departure from the traditional approach to the federal VAT.

CROSS-BORDER TRADE: EU EXPERIENCE

The main reason why the VAT was originally adopted as the required form for general sales taxation in the European Union was its advantage in implementing the destination principle with respect to cross-border trade. As observed by Bird and Gendron (1998), only with the value added form of sales tax could member countries be sure that imports were fairly treated in comparison to domestic products, and that exports were not subsidised by over-generous rebates at the border: "It is thus somewhat ironic that the best way to apply VAT to cross-border trade within the EU has been a matter of considerable debate since the beginning. This issue has not yet been resolved."

From the Neumark Report (1963), with its recommendation for the eventual adoption of the origin principle for intra-EU

trade, through such major contributions as Cnossen and Shoup (1987) to the recent proposals of the European Commission (1996), tax experts have put forth a variety of solutions to the perceived problems. Nevertheless, one has either resolved the issue or achieved full acceptance. Despite the arguments advanced in favour of the origin principle of applying a VAT within a country or the European Union, the authors feel that 'the case for the destination principle clearly wins the day. The conditions of wage and exchange rate flexibility needed to avoid substantial distortions in production efficiency if different jurisdictions levy different rates under the origin principle seem unlikely to be satisfied in most federal states, let alone the EU. According to Keen and Smith (1996), the destination method is both more compatible with independent taxation of consumption and, in practice, less likely to result in important economic distortions.

At present, the EU applies the destination principle using 'the deferred payment' method (Cnossen and Shoup, 1987). Exports by firms in one member country A to registered traders in other member countries are zero-rated in A without border clearance being required. Such sales are therefore treated in the same way as all sales outside the EU. In contrast to imports from non-EU countries, however, imports by registered traders in A from firms in other EU member countries are not taxed at the border. Instead, importers in A in effect pay the VAT on imports at country A's rates on their own sales since they have no input tax credits to offset against the tax due. The system works on a self-assessment basis: importers are supposed to declare their imports compute the VAT that would be due, and claim credit for that VAT, all in the same return. The effect is that the VAT is collected on imports only when they are resold or incorporated in goods sold by the importing firm, since imported inputs, unlike domestic inputs, will not generate offsetting input tax credits at that time.

The authors observe that the system may be contrasted with the 'clearing-house' method under which the VAT would be charged on exports by the exporting state, with a credit allowed for this VAT by the importing state as for any other input VAT, but at the tax rate imposed by the exporting state. Revenue accounts would then be balanced between states either on a transaction basis or more likely as in the recent European Commission proposal discussed below, in accordance with consumption statistics. The authors

note that the deferred payment system, which in effect puts reliance on private sector accounting subject to VAT audits, appears to work as well as or better than explicit public offsetting of accounts. This is particularly so because, since 1993, exporters who zero-rate sales to other member countries have been required to quote the VAT registration number of the buyer. Keen and Smith see at least three problems with the deferred payment system as it now operates in the EU: (1) the sustainability of revenues in the face of cross-border shopping, (2) the asymmetrical treatment of trade within and between member states, and (3) problems in cross-border audits, which must rely on the inevitably weak need of interjurisdictional information exchange.

The authors hold that although there seems to be little evidence of significant revenue loss from cross-border shopping in Europe, problems may arise with respect to such high-taxed excise products as motor vehicles. Further, there has been greater concern on the growing phenomenon of 'distance sales' through mail-order and electronic commerce. Still Keen and Smith (1996) conclude that the special schemes now in place in EU countries probably deal with these problems about as well as can be done. There are three such schemes: (1) distance-selling (for example, mail-order), under which firms engaged in such business must charge VAT on the destination basis once their turnover exceeds a specified threshold; (2) vehicles are subject to tax in the country of registration; (3) firms otherwise exempt from the VAT are subject to VAT on the destination basis once their imports exceed a specified threshold. Similar provisions apply with respect to subnational VATs in Canada and have been recommended to deal with problems of interstate trade under the state retail sales taxes in the US. Although there is no simple uniform way to deal with all cross-border shopping problems under any destination-based sales tax, in practice this defect has not yet given rise to serious problems in terms of either revenue or compliance costs, as discussed below.

In order to deal with the second problem they see with the present EU system, namely, the asymmetrical treatment of trade within and between member states, Keen and Smith (1996) propose the introduction of a special 'harmonised' (uniform) rate of VAT (VIVAT, in their terminology) to be applied to transactions between registered traders, while leaving member states free to impose different rates on final sales. From one perspective,

according to Bird and Gendron, this proposal may perhaps be viewed as a sort of uniform 'Euro VAT' imposed at the pre-retail stage, in the sense that it is Europe-wide and uniform and not in the sense that all or any of the revenues accrue to the EU. Bird and Gendron (1998) observe that from another perspective, however, the Keen and Smith (1996) scheme in effect rectifies one asymmetry, between trade within a member state, and trade between member states, by creating a new one, between sales to registered taxpayers and sales to final consumers. According to the authors, this scheme opens the door to a new form of fraud, since sales to registered tax payers are taxed at a lower rate. Under the system now operating in Quebec, Canada appears both to avoid this problem and to provide a good basis for cross-border audits, while retaining most of the advantages of the Keen-Smith proposal.

The most recent proposal from the European Commission (1996) takes a very different tack. Emphasising the complexity and defects of the way in which the present VAT system attempts to deal with cross-border problems with respect to firms operating in more than one member country, the commission proposes a 'common' VAT system which would look very different from either the present system or the Keen and Smith proposal. As Smith notes, the commission's proposed system has five interlocking elements: a uniform base and virtually uniform rates; extensive administrative co-operation; a single place of taxation for every business within the EU; the extension of the 'chain' of VAT credits to include cross-border transactions; and, finally, the allocation of VAT revenues among member states on the basis of aggregate consumption statistics.

Bird and Gendron (1998) note that in many respects, this proposal is essentially equivalent to the VAT now operating in several small Canadian provinces under the system of the "harmonised sales tax (HST)". As the authors feel that this degree of 'commonality' is neither necessary nor desirable in Canada, it seems even less likely to be a viable basis for the separate countries that make up the EU. Like Smith, the authors think that a more satisfactory approach to the problems with the current regime may be found in less sweeping changes that would leave member states with considerably more fiscal autonomy.

CANADIAN EXPERIENCE

At the present time, as Bird and Gendron note, Canada may be the most interesting

country in the world for sales tax aficionados. The country has ten provinces, with five distinct sales tax systems. There is a federal VAT, the Goods and Services Tax (GST), that applies throughout the country. In one province (Alberta), the GST is the only sales tax. In four provinces, namely, British Columbia, Saskatchewan, Manitoba, and Ontario, in addition to the GST there is a separate retail sales tax (RST) applied to the GST-exclusive tax base. In one province, Prince Edward Island, the provincial RST is applied to the GST-inclusive tax base. In three provinces, namely, Newfoundland, Nova Scotia, and New Brunswick, there is a joint federal provincial VAT, called the harmonised sales tax (HST) and administered by the federal government at a uniform rate of 15 per cent. Finally, in one province, Quebec, there is a provincial VAT, the Quebec sales tax (QST), applied to the GST-inclusive tax base. The QST is administered by the provincial government, which also administers the GST in the province on behalf of the federal government.

Canada thus presents a variety of interesting situations: separate federal and provincial VATs administered provincially, joint federal and provincial VATs administered federally, and a federal VAT and provincial RSTs administered separately. Our discussion here, however, is confined to the salient features of the QST and HST, which are relevant to the main focus in this chapter.

QUEBEC SALES TAX

Though the Quebec sales tax (QST), which is the VAT imposed by the province of Quebec and Canada's federal GST are both broad-based taxes on consumption, there are certain differences between them, though they have become much less at present compared to the time of their initial imposition in 1991. While the GST is levied at a single rate of 7 per cent which applies to most taxable goods and services consumed in Canada, the QST now also has one general tax rate of 7.5 per cent which is applied to the price of the good or including the GST, so that the combined rate is 15.025 per cent. Though the QST initially imposed had two different rates for goods and services and a number of differences in base from the GST, most significant differences between the GST and the QST have disappeared. For example, although there is still no QST on books, the tax is now eliminated by giving an instant rebate following payment of the tax. While the administration of this rebate

has led to complicating the system, this approach, according to Bird and Gendron (1998), permits the preservation of a uniform VAT base for both federal and provincial taxes while allowing differential treatment at the final consumer level.

The major difference between the two tax bases relates to input tax credits. Certain input tax credits for large firms that are allowable for GST are not allowable for QST. The government of Quebec was supposed to eliminate all such restrictions initially by November 1996 and then by March 1997. In fact, however, the government announced in its March 1997 budget that it intended to maintain those restrictions for an indeterminate period, presumably for revenue reasons. Despite this minor hitch, it could be claimed that the QST and GST constitute an operational 'dual VAT' system. The rates of the two taxes are set quite independently by the two levels of government. Though essentially the same, the tax bases are also determined independently. Further from the beginning, the GST in Quebec has been administered along with the QST by the province, that is, the province collects both taxes at the same time and then turns over the federal share to the federal government. Such arrangements have long been common in Canada in the income tax field, although the agreed single administrative agency has always been the federal government, and they have applied in Quebec. According to Bird and Gendron, no problem has been reported with such collection arrangements, regardless of the direction of the revenue flow.

Taxes on interprovincial sales from one business to another are basically handled by a deferred payment system very much like that now applied in the EU as 'transitional' regime. Exports from Quebec, whether to another province or another country, are zero rated. Imports into the province from another province, or abroad, are taxable, but the tax is only assessed on interprovincial imports when there is a sale by a registered importer to consumers. This system is essentially the same as that now applied in the EU, with, however, the critical addition of the overriding federal GST as an enforcement mechanism. Interprovincial sales to final consumers, as the EU, give rise to problems. In principle, non-registered persons are required to self-assess the QST on imports for private consumption or for use in exempt activities. As in the EU, some special regimes apply for certain high-value items and in other cases.

With respect to audits, Revenue Canada, the federal tax agency, establishes certain

audit priorities. Once the final audit plan is agreed upon by the *Ministère du Revenu du Québec* (MRQ), MRQ then carries out the audits, reporting back to Revenue Canada with respect to additional assessments, appeals, and so on. Since the QST is applied to a GST-inclusive base, the Quebec government obviously has some incentive to monitor the GST as well as the QST. Although Quebec cannot directly monitor, say, a zero-rated export sale to an Ontario firm to ensure that such a firm actually exists, the normal process of federal GST audit to some extent serves as a cross-check to ensure that QST has not been evaded. The existence of a federal sales tax in a sense thus monitors interjurisdictional sales within the country for purposes of provincial as well as federal taxes. On the whole, according to the authors, the system appears to be functioning well, with each agency appearing to place reliance upon the competence and integrity of the other.

HARMONISED SALES TAX

In April 1997, the federal government of Canada and the governments of its three small and fiscally dependent eastern provinces, Newfoundland, Nova Scotia and New Brunswick, harmonised the federal GST and the sales taxes of those provinces in what is called the harmonised sales tax (HST). The basic elements of the HST include the replacement of the previous separate federal and provincial sales tax systems with one harmonised VAT; a combined federal-provincial rate of 15 per cent in the three participating provinces; and a single administration of both federal and provincial sales taxes by the federal government. The new combined rate consists of the 7 per cent GST and an 8 per cent provincial tax (applicable to a base excluding the GST), for a total HST rate of 15 per cent. This new combined rate is significantly lower than the previous combined rates of 19.84 per cent in Newfoundland and 18.77 per cent in the other two provinces. The federal government and the participating provinces share total tax revenues on the basis of province-specific consumption patterns, in accordance with allocation formulae to be developed jointly by the federal government and the provinces.

Revenue Canada administers the harmonised tax under a comprehensive tax co-ordination agreement for the administration of sales taxes in each province. As with the QST, exports to other provinces are zero-rated. At the same time, however, unlike the QST, GST registrants in other provinces selling to

anyone in the HST provinces must charge HST on such sales. HST registrants making such purchases may then claim credit for this tax, but final consumers or exempt purchasers will have to bear the full tax whether they buy from in-province or out-of-province sellers. Purchases across international borders are subject to HST on import. Like the GST, complex rules determining the 'place of supply' are intended to bring to tax many cross-border service supplies and to remove any tax inducement to cross-border shopping.

According to Bird and Gendron, the federal government's apparent objective in persuading the small provinces to adopt a common HST system was to have both a common base and minimum variation in rates, preferring them to lie in the 14-15 per cent range. In practice, all the three provinces have imposed a 15 per cent rate. The authors note that in terms rather like those used in the recent EU proposal of 1996, the federal government's justification for this approach was that a common sales tax base and rate would yield significant savings in compliance costs for business and administrative costs for governments. According to them, the economic rationale for requiring uniform rates across provinces is weak since, as demonstrated with the QST, there are no significant costs in imposing differential provincial rates on final sales in a destination-principle sales tax. Further, there are good economic and political reasons for permitting rate differentiation to meet specific revenue needs, preferences, and the like. The HST thus unnecessarily hinders provincial autonomy in the sales tax field. At the same time, the authors point out, it has tied the federal government's hands since it cannot change either the base or the rate of the tax without the unanimous agreement of the affected provinces [Bird and Gendron 1998].

According to Bird and Gendron (1998), the HST, in some ways, is clearly superior to the initial 1991 agreement between the federal government and the government of Quebec and the important policy differences which initially plagued the Quebec deal are not present. Nonetheless, it is far from clear that the HST is superior to the QST-GST system as it has evolved over the years and currently operates. Given the presence of the GST at the federal level, some harmonisation in federal-provincial sales tax systems appears to be necessary. The authors suggest three principles to achieve sound harmonisation: (1) harmonisation should lead to simplification of the sales tax system, so that compliance and administration costs and the

related efficiency losses are minimised; (2) harmonisation should respect provincial autonomy by allowing provinces to choose a sales tax rate that may differ from the federal sales tax; and (3) there should only be one agency to administer and collect the sales tax.

The authors point out that the harmonisation agreement with Quebec respects provincial autonomy but initially failed to achieve the other two principles. For example, auditing rules in Quebec used to depend upon whether the business was headquartered in that province or not. At present, however, Quebec's sales tax is more or less fully harmonised with the GST, and all three of the principles stated above are more or less satisfied. In contrast, the HST agreement satisfies the first and third of those principles but clearly restricts provincial tax autonomy. From the perspective of those provinces signing the agreement, presumably the financial benefits received were worth the loss of tax freedom, but it is hard to see why any of the larger provinces would buy into this deal.

Holding out that a centralised VAT seems neither a realistic political possibility nor a desirable outcome given the current assignment of taxing powers in Canada, the authors feel that the federal Quebec harmonisation agreement, as initially implemented, was not a good model because of the many differences in the base; but neither is the recent agreement between the federal government and the three Atlantic provinces, which comes at the cost of a significant decrease in provincial tax autonomy. The revised QST arrangement, the authors note, seems much closer to a good solution: there is a single (provincial) administration; there is basic conformity on all important aspects of the dual VATs that significantly affect compliance costs; and there is complete autonomy in rate setting (and, to a limited extent, even in granting exemptions to final consumers, if desired). Further, the authors add, as the recent Quebec budget demonstrated by maintaining restrictions on input credits for large businesses, there may even be room for bad but politically popular tax policy without damaging the general system. While this may not be good news for tax experts but it will, no doubt, be welcomed by governments.

According to the authors, Canada's present system, with some provinces harmonised and others not, of course provides some opportunities for tax arbitrage. There are also administration and compliance costs when businesses engage in cross-border trade. The same is

true of shopping and trade between bordering provinces with different sales tax regimes like either Quebec and New Brunswick or Quebec and Ontario. These problems will continue to create some pressure to harmonise on provinces which have not done so yet. If, for example, the authors note, Manitoba chooses to enter the harmonisation agreement, Ontario may face increased competitive pressure to harmonise since it will then be between two provinces with harmonised sales taxes and lower taxes on business inputs. Such considerations may speed up the harmonisation process in Canada.

The Canadian experience, according to the authors, suggests that a VAT can be imposed at the provincial level in a relatively efficient manner as long as business inputs are not taxed. Under their retail sales taxes, the provinces have traditionally taxed many business inputs, largely for revenue reasons: "Taxes hidden from the public are easier to get away with in a democracy, if inherently less desirable. Jurisdictions with net exports may tend to overtax in these circumstances (as often seems to be assumed in critiques of origin-based subnational VATs). Alternatively, they may tend to undertax, as assumed in the tax competition discussion, if they fear a loss of tax base." According to the authors, even with a VAT, business inputs may still be taxed to some extent (indeed, owing to the treatment of the financial sector, they almost invariably are), but such taxes are likely to be much less important than before the introduction of a VAT. In fact, as the authors note, the reduction of distorting input taxes is one of the main reasons favouring the VAT as a form of sales taxation.

The phenomenon of cross-border shopping, the authors note, makes it difficult for provincial governments to tax mobile populations. While cross-border shopping has hardly been a serious factor in geographically large countries like Canada with dispersed populations, this phenomenon could limit the scope for independent sales tax policy at the subnational level in smaller countries. While problems with 'distance shopping' on account of mail-order and internet remain even in large countries, the authors point out that applying what is in effect more or less the present EU system for treating cross-border trade works better within Canada than it seems to do in Europe, partly because the existence of the overriding federal VAT provides a verification mechanism that does not exist in the EU. "Indeed, both Canadian systems – the HST and the QST – may prove helpful in thinking about not

only the EU problems discussed below but also problems with subnational VATs in several large developing federations discussed earlier.

Bird and Gendron have shown that in the light of the Canadian experience, independent subnational (dual) VATs are feasible in the absence of border controls, and second, that in some ways it is easier to resolve some problems of cross-border trade when there is a dual VAT system, that is, when subnational VATs are matched by a national VAT which provides a substantial degree of control over interjurisdictional trade. The GST-QST system, according to the authors, has proved to be administratively feasible and capable of dealing satisfactorily with cross-border trade between registered firms while still providing all jurisdictions with considerable fiscal autonomy and avoiding arguments about who gets how much revenue. In the case of the EU, similar results might be achieved simply by retaining the present 'transitional' system, combined with more attention to intermember coordination of VAT application and administration, with no need for imposed rate uniformity and more freedom for local variations, especially at the consumer level, if desired. According to the authors, the basic condition required is that all parties concerned trust the quality of the administration in the other jurisdictions. If more weight is placed on reducing administrative and compliance costs and funds are available to offset revenue losses, something more along the lines of the HST system may be preferred. The authors feel that both approaches may perhaps be pursued simultaneously, with the stronger and richer units following the QST path and the smaller and poorer ones the HST path. Though problems with respect to cross-border shopping and distance sales through mail-order or electronic commerce will persist under any possible approach, the authors point out that 80 to 90 per cent of taxable trade takes place between registered firms, and Canadian experience demonstrates both that it is not that difficult to handle this trade in an economically and administratively acceptable fashion and that under the right conditions the existence of a central VAT (or its functional equivalent in terms of information exchange) may make it simpler to run subnational VATs.

The authors recommend the following two minor administrative changes in order to facilitate the implementation of a two-tier VAT system: (1) To include an appropriate location code in VAT registration numbers. (2) To include the VAT

number of both buyer and seller on the invoice. For such a system to work satisfactorily, the authors feel that there must be adequate exchange of information between both levels of tax administration, a process that can be greatly facilitated if both have VATs and hence a direct financial interest in its success. From this perspective, the authors note, it is immaterial whether there are actually two separate administrations or one; or, if there is one, which level operates it. According to the authors, a single central administration and a common base as in Canada's personal income tax system or the HST would probably be most efficient, but this degree of convergence is not essential: "What is critical is either a unified audit or a high level of information exchange between the provincial and federal administrations, as generally prevails in Canada under the QST." In the absence of a central VAT, the authors feel that it would be difficult to set up adequately functioning subnational VATs in the absence of a border control system.

According to the authors, Canadian experience suggests not only that there is no need to be excessively pessimistic about the possibility of decent subnational VATs but also that one helpful solution to some problems of cross-border trade may lie in the creation of a parallel tax structure of the country or union as a whole. They draw three conclusions from Canada: first, with good tax administration, independent subnational VATs on the destination basis are feasible; second, such VATs probably work best when there is an overriding central VAT on approximately the same base – and either (and preferably) both taxes are operated by the same administration or else there is very close co-operation, particularly in audit; third, since neither of the preceding conclusions depends upon which level runs both taxes (if there is to be one administration) nor upon the adoption of uniform subnational tax rates, a dual VAT structure may be made consistent with a wide range of administrative and policy sovereignty [Bird and Gendron 1998].

While the authors concede that two VATs may not be cheaper than one, they may, in their view, work better than seems generally to be thought, in part because each to some extent acts a check on the other, not least with respect to cross-border trade. The system of QST as well as HST suffers from two drawbacks apart from the problem of cross-border shopping. In the first place, there is really no need to have VATs two different levels and the system should work better if there is only one

agency responsible for the levy and administration of the VAT. In fact this is one of the principles stated by Bird and Gendron as we noted earlier. Secondly, the HST agreement, clearly restricts provincial tax autonomy. It may be seen that only three smaller provinces have agreed for this arrangement and not any of the larger provinces. It is doubtful if the states would agree to such restrictions placed on their powers by the centre. I am of the firm view that there is no need to have two types of VAT, one at the federal and another at the subnational level. In the light of the experience gained so far, it is desirable to vest commodity taxation only in one level of government and that has to be the central or federal government only. This would mean that the provinces or states will have to necessarily give up their powers of sales taxation. Apart from the political sensitivity of the issue, it should also be appreciated that the states or provinces would not be merely satisfied if the loss of revenue on account of surrendering their powers of sales taxation is adequately compensated by a generous revenue-sharing mechanism by the central or federal government. In order to assert their independence and supremacy, the states or provinces would like to enjoy certain powers of taxation, which they would like to put to the best use, without merely depending on a share in revenue from the central or federal government, as the case may be. The alternative model suggested in this paper rests on this principle.

If the states have to be persuaded to give up their powers of sales taxation in favour of the centre to enable the latter to introduce and implement the VAT by replacing the current system of commodity taxation at two levels, it could not be achieved by a mere, however generous or liberal it could be, revenue-sharing formula but only giving to the states some other powers of taxation in exchange, adopting a 'give and take policy', reflecting the true spirit of true federalism. This is the basic principle on which the alternative system recommended in this chapter is founded.

In the case of India, 65 per cent of the combined tax revenue of the centre and the states is raised by the centre, the balance 35 per cent being raised by the states. This 65 percentage share of the centre is made up of union excise duties (26 per cent), customs or taxes on international trade (21 per cent), corporate income tax (8 per cent) and personal income tax (7.2 per cent). The 35 percentage share of the states is composed of sales taxes (20 per cent), state excise (5.25 per cent) and vehicles taxes (3 per cent). The magnitude of the

proposed surrender of sales taxes to the central government for being merged with the union excise duties for transforming both the taxes into a full-fledged value added tax could be appreciated from these figures.

Among the central taxes, while the union excise duty, after its proposed merger with states' sales tax, will be transformed into a value added tax, the other major tax namely, customs duty or import and export taxes, should always be imposed by the national government only, "to reduce the possibility of introducing major distortions within the country through differential foreign trade taxes imposed by different jurisdictions" [Norregaard 1997:69]. The only two other major central taxes are the personal income tax and the corporate income tax. Let us examine the possibility of assigning any of these taxes to the states.

Most of the countries in the world assign the personal income taxes in their entirety or a large proportion of them only to the central government since it is used for stabilisation as well as redistribution. There are, however, exceptions to this practice which include the Scandinavian countries, Switzerland, the Baltic countries, Russia, and the other countries of the former Soviet Union. In the US, the income tax is levied both by the federal and the state governments and in some cases even by the city governments, while, in Canada, the central and provincial governments levy income tax. Incidentally, the US, Switzerland and to some extent, Canada follow the principle of 'concurrency' with regard to the levy of personal income tax. It is true that the more developed is a country the higher is the likelihood that individuals receive income from different sources and these income may be derived from different jurisdictions. This may move countries to prefer a global income tax system in which the different income sources are added together for each individual, which requires collection of information on personal income from other jurisdictions, with possibilities of tax evasion being large. In these circumstances, as observed by Norregaard, it is preferable to keep the global income tax base with the central government which is better equipped to acquire the necessary information. Since, however, the mobility of individuals and households tends to be less than that of business, the personal income tax, as pointed by Ter-Minassian (1997:9), is more suitable for partial assignment – through tax overlapping – to the sub-national, particularly, the provincial level. However, it is necessary that

the definition of the tax base should be homogeneous throughout the country and the rate differentials among sub-national jurisdictions be kept relatively small. In fact the system followed in the Nordic countries and Canada, where the provincial income tax is levied as a percentage of the federal income tax is definitely superior to a normal flat rate system, since the former increases the revenue elasticity of the subnational tax as the subnational governments will stand to gain in the event of increases in the income tax by the central government. Since international experience is in favour of allowing both the federal and the provincial governments to exploit the personal income tax, this is best achieved by permitting the states to 'piggyback' its income tax on the federal or central tax base.

In the case of India, the Constitution provides for levy of a surcharge on income tax, which is, however, not sharable with the states. It is suggested that the power to levy surcharge on personal income tax should be delegated to the states for their exploitation. Any move in this direction should be invariably accompanied by a corresponding reduction in the marginal rates of income tax. As a consequence, the share of central tax revenues to be devolved to the states might have to be reduced. While giving the power to the states to levy the surcharge on income tax would specifically favour the industrialised states, the states as a whole would have more flexibility. Here is a classic case of autonomy versus equity.

It should, however, be appreciated that giving the power to the states to levy the surcharge on income tax alone would not be enough to compensate the states for agreeing to surrender their powers of sales taxation. This takes us to have a look at the possibility of allowing the states to exploit the corporate income tax base on the lines of the system prevailing in countries like Canada and the US. According to Norregaard (1997:66), there is almost universal agreement that the taxation of larger business, and in particular corporate profit taxes, should be left to the national government and to provinces or states only where these are very large as in Canada.

The current experience with allocation is found in the US, Canada, and Switzerland. In the US, the 46 states that levy corporate income taxes use a factor formula to apportion income to its jurisdiction. Non-business income such as capital gains, royalties, dividends, interest, and rents may be taxed separately by the state if the income is earned in the jurisdiction.

However, some states apportion all sources of business and non-business income. The factors generally include sales, property, and payroll factors but they vary from state to state. Many states use an equally weighted average of payroll, sales, and property (the Massachusetts formula) but almost half of the states use some other variant, most often by putting twice the weight on the sales factor. Corporate income is measured by adjusting the federal definition for specific state provisions. Maximum rates of corporate income tax at the state level vary from 3.4 per cent in Indiana to 12.25 per cent in Pennsylvania, the average being about 7 per cent. State taxes are deductible from the federal corporate income tax. Though 46 states in the US impose corporate income taxes, the share of corporate income tax in total revenues of the states has declined in the recent years. In fact Michigan has replaced its corporate income tax with a value added tax, which differs from the value added tax elsewhere in the sense that it is based on the additive method. Under this method, the tax base is determined by adding wages and profits before taxes and debt service with certain adjustments.

In contrast, the Canadian system is based on a more harmonised approach for determining the amount of corporate income allocated to provinces. Partly this is driven by the tax collection agreements which the federal government has with seven provinces whereby the federal government collects provincial corporate income taxes at no charge and the provinces agree to use the federal corporate base for determining income. The provinces are free to set their own rates of tax and the federal government will administer on their behalf tax credits, namely, investment tax credits for manufacturing equipment or research and development, which reduce the amount of provincial tax owing to the province. Three provinces, Ontario, Quebec, and Alberta, collect their own corporate income tax. In fact these three provinces account for nearly 75 per cent of the provincial corporate income tax base in Canada. All provinces, including those that collect their own corporate income tax, use a common factor formula where equal weights on sales and payroll to determine the shares. Even those provinces which collect their own tax, use a base similar to federal base except for a few adjustments. The federal government provides a 10 per cent tax credit to make room for the provincial corporate income tax. In Switzerland, the cantons levy corporate income taxes on a progressive basis subject to minimum and maxi-

mum rates. The Swiss cantons may use their own factor formula and there is no consolidation of returns in Switzerland [Mintz 1998]. In Brazil, the states can levy a 5 per cent surcharge on the corporate income tax. The argument put forward by some of these countries is that the economy could benefit from state and local governments competing for industrial development, that local governments are entitled to recoup the cost of public services used by business, and that, in any case, many companies do most of their production and sales within a single jurisdiction [Bahl 1994:133-35].

If one is serious about introducing and implementing a value added tax in its true letter and spirit in India, the system of commodity taxation in vogue at present has to undergo a sea change into 'something rich and strange': the union excise duties of the centre and the sales taxes of the states have to be merged, the central sales tax abolished and the powers of commodity taxation fully vested in the central government to facilitate the transformation of the existing cascading taxes, namely the union excise duties and sales taxes into a full-fledged value added tax. This has to be invariably accompanied by giving the powers to the states to exploit personal income tax by 'piggy-backing' the central income tax base on the one hand and allowing the states to levy corporate income tax on the lines of the system prevailing in Canada and the US. Since the sales tax revenue accounts for as high 20 per cent of the combined tax revenue of the centre and the states, even the above dispensations alone may not be adequate to compensate the states for the loss of revenue which the states are likely to suffer. Therefore the shortfall has to be complemented by the traditional revenue sharing mechanism of the revenue from the new VAT. In order to ensure a fair share to the states, it would also be necessary to assign a suitable weight, say, 10 to 15 per cent, to the 'collection' or 'contribution' factor in the scheme of horizontal redistribution of the revenue from the new VAT among the states. In other words, part of the divisible pool of the new VAT revenue will have to be made available to the states on a derivation basis. This would be necessary since the loss of revenue of the states on surrendering the powers of sales tax to the centre will be directly proportional to the quantum of the revenue from the first-point sales tax bulk of which comes from the excisable commodities. Fine-tuning of the vertical as well as horizontal sharing of the new VAT revenue will have to be done carefully in

consultation with the states and the mechanism of the Finance Commission will be best suited for this purpose. While the above model has been specifically designed for India, the rationale of the model and the principles on which it has been formulated apply in equal measure to other federal economies which suffer from the system of dual level of commodity taxation and wish to implement a VAT.

For instance, we could apply the above principles to another federal economy, Canada, which is keen to replace the state retail sales taxes by a nationally administered integrated VAT. Canada has been finding it extremely difficult to secure the co-operation of the provinces to implement the national VAT. While three smaller provinces have introduced the HST, Quebec is the only province which has harmonised its general sales tax with the federal VAT, other provinces still levy a general sales tax, which is a single stage tax collected at the retail level. These states not only have varying tax rates, but in the case of Alberta, there is no provincial sales tax at all. The existence of two widely different sales taxes imposes collection costs on business firms which are quite high and clearly unnecessary.

In the first place, it should be noted that on a national-accounts basis, as of 1993, federal government own-source revenues in Canada, were almost equal to own-account expenditures (just 1.1 per cent lower), while the provincial-local governments had own-source revenues 23.2 per cent below own-account expenditures [Clark 1996]. This vertical imbalance is a clear pointer just not towards the need for federal transfers to the subnational governments in Canada but also the need for the provinces to be provided with additional sources of revenues.

In Canada, natural resources belong to the provinces as per the Constitution and therefore the provinces have access to royalties as well as tax revenues. The provinces derive large revenues from levies on natural resources, to capture their economic rents. Such revenues are rather unevenly distributed, going largely to the three western provinces. Eighty five per cent of all oil and gas is produced in one western province, Alberta and the natural resources are largely responsible for the differences in the fiscal capacity of provinces. At the same time, under the Canadian constitution, the federal government also has the authority to tax natural resources and the federal government's main source of revenue from oil and gas has been the corporate income tax. This division of powers, namely provincial ownership and

federal regulation, has been a source of intergovernmental conflicts in Canada [Clark 1996]. The Canadian authorities may consider negotiating with the provinces by offering them powers of taxation of natural resources in exchange for their agreeing to implement the national VAT.

In the final analysis, the experience gained in several federal economies, irrespective of the fact whether they are developed or developing, has established fairly beyond doubt the undesirability of subjecting commodity taxation to two levels, the federal and provincial, particularly in the context of introducing the VAT. While it is considered necessary to entrust the entire field of commodity taxation to the national government which is best equipped to implement the VAT, the redistribution of the powers of taxation between the central/federal government and the states will depend on the situation and circumstances prevailing in each country and that no generalisation may be possible with regard to assignment of specific taxes to the states. International experience has shown that both personal and corporate income taxes are good candidates for partial assignment, particularly in large federations but the same cannot be said about a tax like the one on natural resources. Similarly, while property taxes have been traditionally assigned only to the subnational governments, the system is somewhat different in Brazil, where urban property is taxed at the municipal level, while the federal government levies and administers the tax on rural property. This may be a possible area for reform in the event of Brazil wishing to develop a model based on the above principles. Therefore it may be necessary for each federal country to evolve its own system by applying the above principles.

A tie-up that's exactly our chemistry

Colour Chem integrates with the new Clariant Group, the world's No. 1 in Specialty Chemicals

You've been seeing the Clariant logo appear along with our name on all our communications. The new association strengthens Colour Chem's commitment to offer value added products which enjoy the technological backing, global reach and new business opportunities offered by the Clariant Group.

COLOUR-CHEM'S BUSINESS PORTFOLIO: PIGMENTS AND ADDITIVES, FINE CHEMICALS, PROCESS AND PERFORMANCE PRODUCTS, CELLULOSE ETHERS AND POLYMERISATES, SURFACTANTS. **REGISTERED OFFICE:** HAVINDRA ANNEX, 194, CHURCHGATE, REKLAMATION, MUMBAI-400 020. TEL: 202 2161, 201 0862 FAX: 202 9781

RTA/IN/99

Now your loaded trucks can travel 734 Km. daily with not a drop of fuel used.

Thanks to Konkan Railway's **Ro-Ro service** (Truck-on-Train concept)

Save time:
50% to 70% goods transportation time is saved

Save on Costs:
Saves Mumbai - Mangalore 'truck on road' journey time by 20% to 30% : gives extra fleet utility

Save Wear & Tear:
No wearing out of expensive truck tyres and other repairs. Low maintenance - increases vehicle life and helps avoid 'fleet idling' time

Save fuel costs:
More economically viable

If your trucks are going South, just let them 'Roll-On' to the train at **Kolad**, 145 km from Mumbai. They will 'Roll-Off' at **Surathkal**, 20 km from Mangalore. That saves you a 734 km. stretch of travel, without any tension or worry. And you get guaranteed delivery within 24 hrs. both ways. If the trucks are going North they 'Roll-On' at **Surathkal** and 'Roll-Off' at **Kolad**. These are scheduled daily noon services, operative both way.

SEPHIS

CODESRIA, Council for the Development of
Social Science Research in Africa
and
SEPHIS, South-South Exchange Programme for
Research on the History of Development

EXTENDED WORKSHOP FOR YOUNG HISTORIANS

From October 4 to November 5, 2000, a workshop on new theories and methods in social history will be organised by CODESRIA in collaboration with SEPHIS. The focus of this comparative workshop will be on Latin America, Asia, Africa and the Caribbean.

The workshop aims to bring together about 15 historians (aged between 25 and 35) for a period of five weeks. They will share their research experiences and get an opportunity to improve the theoretical and methodological quality of their work. The workshop will be held in Dakar (Senegal, West Africa). CODESRIA will provide a stimulating environment and take care of the travel and living expenses of the participants.

Contents of the workshop

Participants will discuss new theoretical and methodological approaches in social history, as well as their current work. The workshop will be led by a researcher with an established reputation in the field. Three distinguished historians from various parts of the South will join the workshop to give intensive three-day courses on the latest developments in social history in their respective areas.

Eligibility

The workshop is open to PhD students in history registered in Southern universities.

Application procedures

Applications should include the following:

- An academic curriculum vitae (one page),
- A letter certifying that the candidate is enrolled in a PhD course at a university in the South,
- A proposal outlining the current research project, including its methodology (at most 4 pages),
- A sample of the applicant's work (a draft paper, a draft research proposal or a draft thesis chapter),
- A letter from the thesis supervisor indicating why this workshop is of importance for the applicant's research.

Applications must be written in English. **The deadline for submission is 30 March 2000.** An international scientific committee will select the candidates in April 2000. Incomplete applications, applications by fax or email and/or too lengthy applications cannot be taken into consideration.

Applications and requests for more information should be sent to:

Vol XXXIV No 41

October 9, 1999

Indian Agriculture: From Marrakesh to Seattle

The Agreement on Agriculture (AOA) is one of the major agreements signed in the Uruguay Round in Marrakesh in April 1994. Since agriculture was being brought under the new rules of the world trading system for the first time, it was provided in the AOA itself that the agreement should be taken up for detailed review before the end of the millennium. So agriculture will come up for discussion in an important way at the Seattle meeting at the end of next month. What are India's interests and options with respect to the AOA? What should India put on the negotiating table? **2931**

China: Two Eras and After

The legacy of the last 50 years of the People's Republic of China comprises two decades of revolutionary mass mobilisation, two decades of reforms and a 'lost decade' in between. While there can be no turning back, as the Chinese continue to hurtle on the Dengist road of market reforms, they will have to pause somewhere, sometime to figure out exactly where they are headed. **2906**

What has been the impact of reforms on the Chinese health system and how is China responding to the situation? **2908**

Poverty in Pakistan

In Pakistan over the last decade growth has slowed down markedly, development and social sector spending by the government has been slashed, inflation has gathered momentum, manufacturing sector growth has been exceptionally low and remittances have fallen to their lowest level in 20 years. In other words, all the factors which may have had a positive influence on poverty alleviation have deteriorated. Poverty in Pakistan is therefore likely to grow and persist well into the future. **2943**

Raniganj Coal Crisis

The decision to close down 64 'uneconomic' collieries under the Eastern Coalfields will render 72,000 people unemployed besides damaging the economy of the Raniganj coal belt and could also be the first step towards privatisation of coal mining. **2952**

Right to Development and NGOs

Transparency, accountability, effective participation and equality of access are essential to the exercise of the economic, social and cultural rights which are integral elements of the right to development. Civil society organisations working on different issues for different interest groups, separately or in combination, have a historic role to play in this context. **2920**

Dalit Feminism

Cultural revolt is essential but it needs to be invoked in every aspect of everyday life as well as in relation to access to natural resources. Caste oppression began by denying access to these resources and so it is essential to reclaim them. **2964**

Free Speech

Intolerance of dissent from the orthodoxy of the day has been the bane of Indian society for centuries. But it is precisely in the ready acceptance of the right to dissent, as distinct from its mere tolerance, that a free society distinguishes itself. **2898**

Media and Kargil

For the Indian media Kargil was big news. But what was the subtext of the pages and pages of print? Are we indeed as well informed about the conflict as the media blitz would imply? **2917**

Getting Smaller

The emergence of some small single-caste parties in eastern UP is indicative of the failure of the larger parties to effectively represent or bond with certain social interest groups which are no longer content with being the vote-banks of the larger parties. **2912**

Child Health Initiative

Vitamin A deficiency has only recently been acknowledged as a major public health problem in India. Orissa has initiated a new programme that will ensure that young children are adequately protected from the consequences of vitamin deficiency **2914**

Community and Identities

Questions of identity and culture had perhaps never been so important for the social science disciplines of sociology, anthropology, history and even geography as they are today. **2957**

Liquidity Strain

With government borrowing threatening to exceed last year's record level, the pick-up in demand for commercial credit and the slackening of bank deposit growth, the signs of liquidity strain in the latter half of the year are unmistakable. **2899**

LETTERS TO EDITOR

Third Millennium: Dawn or Dusk?

TODAY, AD 1999, as we celebrate to welcome the new millennium, let us not forget that this is year 5760 in the Hebrew calendar, and about the same age by the chronicles of ancient China, Egypt and India. Let us also recognise that while the arrow of time flies irreversibly in one direction, history is about to repeat itself, first it was a tragedy, but now possibly it would be, not a farce, but surely far less entertaining. But are we aware of it?

Storm clouds were gathering over the horizon in the early hours of the second millennium. In November 1095, Pope Urban II summoned the knights of Europe to launch the First Crusade. He was expecting a conventional military campaign, but got a mass movement on his hands. Within months hordes of men, women, children, priests, foot soldiers and knights set off on the adventure.

One of the first armies to leave Germany for Jerusalem attacked all the Jewish communities along the Rhine Valley in 1096, the first of many pogroms on the way by the Crusaders. What ensued was totally outside the calculation of the enterprising Pope. What happened thereafter all through the second millennium, especially during the dark days of the second world war, was inconceivable.

As the curtain falls on the fading millennium we see the triumph of humanity. On September 8, 1999, John Cardinal O'Connor, Archbishop of New York, sent an inspiring and courageous letter to his many Jewish friends. He acknowledges "the pain inflicted on the Jewish people by many of our members over the last millennium". "We most sincerely want to start a new era", the Archbishop writes. "I ask this Yom Kippur that you understand my own abject sorrow for any member of the Catholic Church, high or low, including myself, who may have harmed you or your forebears in any way". The letter was published in *The New York Times* of September 19, 1999.

There are alarming press reports of drum-beats in the name of 'holy war' in south Asia, one of the poorest parts of the world. Will the tragedy of the second millennium be replayed here and now? It can possibly be stopped if the gurus, imams, archbishops, rabbis of India, mindful of the dangers of communal

earnage, seek mutual reconciliation and 'start a new era'.

Archbishop John O'Connor has shown the way.

RANJIT SAU

Newark, NJ, US

Ill-Treatment of Indian Diplomat's Maid

THE controversy surrounding the Indian diplomat and his maid in Paris is getting to be more and more curious. From the beginning when the story first broke out, the response from the Indian government, that is the ministry of external affairs, has been aimed at protecting the diplomat instead of finding out what actually happened.

In a way it is not a novel story. In fact, in the recent years there has been a spate of stories involving wealthy NRIs and their Indian maids. All more or less, though not all of them, as ghastly as the story of Lalita in Paris, exposing the systematic ill-treatment meted out to the poor maids by their Indian employers abroad. But again that is not very different from the treatment of maids in our affluent houses in the country as well, with some exceptions of course.

But what distinguishes the story of Lalita from the scores of similar other

stories is the swift and deep involvement of the Indian government in the cover-up operation for the diplomat without even worrying about the basic rights of Lalita as an Indian citizen, as a woman employee and as a human being. It is equally revealing that not a single political party has, as yet, raised its voice against the response of MEA on the issue.

The demand of the Indian government to hand over Lalita to it and now the 'request' by her mother asking for the quick return of her daughter to her home in India suggest how Indian sovereignty and the structures of patronage are being abused to protect the diplomat from the charges levelled against him by Lalita. We demand the immediate intervention by the National Commission for Women and the National Commission for Human Rights to investigate the issue. We also demand that all efforts should be made to ensure Lalita's security abroad and, on her return, in India so that the truth behind the incident may be revealed to all of us.

Positive Verdict

THE major outcomes of the elections to the Lok Sabha and the assemblies in a few states can be summed up as the prospect of a relatively stable government at the centre, the strengthening of centrist politics and federal tendencies, as compared to before the elections, the relative decline of identity politics and the beginning of a paradigm shift in Indian politics towards a renewed focus on governance and development.

The BJP-led National Democratic Alliance, along with the two allies who prefer to stay outside the alliance, the Telugu Desam Party and the Trinamul Congress, have a combined majority of 24 in the Lok Sabha of 543. There is a possibility of this lead going up when elections are held to the four constituencies where polling had to be deferred on account of floods. This insulates the government from blackmail by small constituents of the coalition. The Indian National Lok Dal, for example, has not seen any point in following up its demand for rolling back the recent diesel price hike with a threat to withdraw support if the demand was turned down. Only the Telugu Desam is in a position to reduce the government to a minority on its own. The fact that it has chosen not to join the government but prefers to extend support from outside, instead of impairing the prospects of stability, actually strengthens them. This is so because TDP leader Chandrababu Naidu's decision to keep his exit door firmly open would act as a restraint on the most potent source of instability for the government: the aspirations of the Hindu organisations which have links of varying closeness with the BJP.

The RSS, the Vishwa Hindu Parishad and the Bajrang Dal and other organisations championing hindutva are happy that the BJP has come back to power. But given that the BJP's strength in the house remains static at 182 and it is dependent more than ever on the continued support of its allies, these organisations are deprived of the freedom to aggressively pursue their communal agenda. Except for the Shiv Sena, all the BJP's allies have a secular outlook and value the support of non-Hindu voters. If the Hindu organisations misbehave and the BJP-led central government refuses to act, the coalition is likely to collapse. The BJP as much as the Hindu organisations cannot but be acutely aware of this vulnerability. This is likely to deter adventurism on the latter's part.

Difference of opinion on basic policies is unlikely to wreck the BJP-led coalition because, except in regard to secularism and nuclear weapons, there is a virtual consensus among the major political parties, inside and outside the NDA. Differences on nuclear weapon policies are minor within the coalition.

The one real source of instability is power-sharing. The BJP and its allies have more experience in this now than in the past

and have learnt, from the AIADMK's setback in these elections, that the electorate does not take kindly to parties that disrupt a government of which they are a part for their own petty ends. If the ruling alliance learns to hold regular consultations among the coalition members on an institutionalised basis, and there is no reason why it should not, this ceases to be a problem.

Centrist politics has been given a boost by two developments: the BJP's willingness to evolve away from its sectarian vision and the revival of the Congress. The moratorium declared by the BJP on the controversial demands for a Ram temple at the site of the demolished Babri mosque, a uniform civil code and scrapping of Article 370 is certainly less than renunciation of its erstwhile sectarian worldview. At the same time, it is more than a ruse to win votes. The simple fact is that democracy is forcing the BJP to leave its communal agenda behind. And this pressure will remain so long as the vast majority of voters refuse to be communalised. Being hemmed in, within the ruling alliance, by parties with secular moorings and centrist views on most matters makes the BJP more of a centrist party than in the past.

The revival of the Congress might be less than apparent, given the steep fall in the party's Lok Sabha tally from 141 in 1998 to 112 in these elections. But it has increased its vote share and commanded the support of 28.4 per cent of those who voted in the Lok Sabha elections. Of the five states that elected their legislatures alongside the Lok Sabha elections, Karnataka and Arunachal Pradesh have gone to the Congress and so can Maharashtra if the party shows a modicum of sense in its dealings with the breakaway group, the Nationalist Congress Party. More significantly, the Congress is back in the reckoning in Uttar Pradesh and Bihar – being out of the race altogether for the 139 Lok Sabha seats from these two states is a handicap that the Congress does not have to worry about any more. Even as appendage to the Nehru dynasty, the party stands to grow further, provided it learns the lesson offered by its come-uppance in Bihar and Tamil Nadu that it is bad politics to rally the corrupt and the incompetent to fight the communal.

Another development that strengthens centrist politics is the clear message from the electorate that identity politics sans governance has run out of steam. The Asom Gana Parishad in Assam and the RJD in Bihar have been marginalised in these elections. It is not that the RJD has grown any less keen to give voice to the backward castes, chiefly the yadavs, of Bihar or champion the cause of the minorities in that state. But there has been a terrible dearth of governance there. And the electorate

has punished the party for that, as decisively as the electorate of Andhra Pradesh has rewarded the TDP's credible commitment to development. The Samajwadi Party's gain in seats in UP, albeit with a reduced vote share, and the BSP's advance might seem to disprove the argument that identity politics has weakened. But only so long as two other factors are not taken into consideration. One, both parties have been trying, desperately, to widen the social base of their support from the narrow stratum championing whose identity they had risen to initial prominence. Of the BSP's candidates this time, less than half were dalits. The SP has been wooing the upper castes assiduously. Two, both the parties gained additional seats in the course of and as a result of the UP electorate's effort to punish the Kalyan Singh government for its comprehensive failure to provide governance.

The BJP, of course, has been in a sense the biggest identity party of all. The drubbing it has received in UP – its seats have come down from 57 to 29 – shows that three years' talk of Ram rajya and hindutva does not compensate for malgovernance of the worst kind. The moratorium declared, at the national level, by the BJP on its controversial demands is a moratorium by that party on identity politics. By aligning with the BJP and risking minority votes, were identity politics the principal consideration, Chandrababu Naidu gambled that voters would attach more importance to his commitment to development. And the gamble paid off. The punishment dealt out to parties in office in Karnataka, Orissa, UP, Delhi and Rajasthan in conjunction with the endorsement of good governance in Andhra Pradesh, Tamil Nadu and even Madhya Pradesh where the Congress's vote share went up even if its tally of seats did not, shows that anti-incumbency is nothing more than a euphemism for the voters' response to bad governance. Let there be no doubt about it – parties have been put on notice: voters want governance, first and foremost.

The BJP and the Congress have been chastened on one count. There is no charisma of the central leadership or a single achievement that drives voters across the country to unquestioning support. State level and local level issues decide who will become the prime minister. This realisation is as significant in strengthening the polity's federal foundations as the dependence of the ruling coalition on the support of a clutch of regional parties.

On the whole, a surprisingly positive denouement for an election that was supposedly devoid of real issues.

THE ELECTION

To Vote or Not: At Gunpoint

THE recent elections witnessed an interesting paradox. While in one part of the country, citizens who wanted to boycott the elections were compelled at gunpoint by the government's security forces to cast their votes, in some other parts voters who were willing to participate in the elections were prevented from doing so – again at gunpoint – by groups which called for boycott of the elections.

According to eyewitness reports by newsmen, in Kashmir personnel of the BSF, CRPF, and other security forces in the Kangan-Ganderbal-Downtown Srinagar belt during the first phase of polling, and army men in the Baramulla district in the third phase, literally dragged people out from their homes and forced them to cast their votes. But in spite of all these efforts to enforce the 'democratic process' by armed might, the turnout hovered between 12 and 27 per cent in these areas, indicating popular alienation from the electoral process. Although the separatist All Parties Hurriyat Conference launched an election boycott campaign, there was no large-scale intimidation of the voters by the militants this time, though a BJP candidate was killed and there were clashes with the security forces. This suggests that the Kashmiris decided to stay indoors and refuse to vote, not out of fear of militant reprisals, but out of their own free will. The boycott could be taken as their verdict on the Indian government's failure to alleviate their grievances and protect them from being caught in the crossfire between the state's armed forces and the militants' offensive.

The picture is totally different in the north-east, or Bihar, or Andhra Pradesh, where armed militant groups gave the call for boycotting the elections. But the people came out on their own to vote, expressing thereby their rejection of the call. In Assam and Tripura, where the secessionist ULFA and the National Liberation Front of Tripura gave the call, the voter turnout in the final phase of polling was about 55 and 60 per cent, respectively. Failing to enforce their call by peaceful means, these groups retaliated by armed attacks on polling stations, snatching of ballot papers, intimidation of voters, abduction of polling personnel and killing of security forces personnel. At least 40 people, including civilians and polling personnel, lost their lives in the north-eastern states.

The toll was heavier in Bihar, where two naxalite groups – the People's War Group

(PWG) and the Maoist Communist Centre (MCC) – gave election boycott calls. During the third phase of polling alone 47 people, including a large number of civilians, were killed when the MCC triggered off landmines in several places. But despite these widespread efforts to disrupt the polls and intimidate the voters, around 56 per cent of the electorate came out to cast their votes. Angered by the refusal of the voters to heed to their call, MCC activists retaliated soon after the voting was over in Hazaribagh district (which they claim to be their stronghold), by raiding two villages there on the midnight of September 27 and chopping off the fingers of those who had dared to defy their poll boycott call and had cast their votes.

There was relatively less violence in Andhra Pradesh where also the PWG had given a call for boycotting elections. In spite of the call, and the group's attempts to disrupt the polls by bomb blasts, around 60 per cent of the voters cast their votes.

In marked contrast to these poll boycott calls sought to be enforced by terror tactics by various militant groups in different parts of the country, there shines perhaps a lone example of a spontaneous popular decision to refuse to vote without any pressure from any armed group or militant organisation in one town in north India. In Mohana in Lucknow (the constituency of prime minister Vajpayee), of the nearly 5,000 voters only 200 cast their votes. The boycott of the polls was organised by a people's committee called the Chunav Bahishkar Samiti (boycott elections committee), which mobilised public opinion in favour of a decision to refuse to vote in order to highlight their problems such as lack of a hospital, schools and better roads. Significantly enough, unlike the pro-boycott militant organisations, the committee decided not to put pressure on people to observe its boycott call.

The low turnout in Kashmir despite armed pressures from state security forces, and the few instances of spontaneous poll boycott by communities in certain towns or villages (as in Mohana) even in the absence of any call for such boycott by political parties or militant organisations, indicate certain isolated, but significant trends. They mainly reflect the local grievances of the people which had not been met – whether the demand for more autonomy of the Kashmiris, or the civic problems of the citizens. Their protest against elections may look like a sore thumb sticking out from the midst of an electoral process which in spite of a deplorable record of criminalisation and failure to ensure the rights of thousands of dalits to

cast their votes, apparently still enjoys the confidence of some 50-60 per cent of the electorate. Many among them may be disenchanted with the process which churns out at the end of every election a government which is as bad as its predecessor, if not worse. But they continue to participate in it in the absence of any better alternative avenue available to them to voice their verdict in favour of a change. After years of armed struggle, neither the secessionist militants in the north-east, nor the naxalite groups in Andhra Pradesh and Bihar have been able to create confidence among the people in their respective areas of influence and offer them a viable democratic process to enable them to assert and articulate their aspirations. Instead, their actions are too often replicating the terrorism of the state. While the latter is enforcing voting in Kashmir with the help of the security forces, the various militant and naxalite groups are enforcing their call for boycotting elections by unleashing terror on innocent people.

WOMEN AND WORK

Triple Burden

AS the impact of globalisation on various areas of society and the economy begins to be better understood, it is evident that there is a deterioration in the social support systems which have played a critical role in holding together the social fabric in times of crisis whether it be of an individual, a family or the community. Equally clear is the fact that neither those who put together economic 'development' packages nor those involved with other 'social' issues have paid much attention to this. The Human Development Report 1999 draws attention to it in great and distressing detail; distressing especially because there appear to be few alternatives which are evolving.

The document points out that in a globally competitive economy there is a squeeze on resources to provide care for those who cannot care for themselves – the young and the very old. With the expansion of employment opportunities, especially of the kind that are most readily available, there is a shrinkage of time available for such care. The increased participation of women, the traditional care-providers, in wage employment is taking them away from homes for longer periods. What happens in such situations? Do others in the family take on that burden? Is there an equal sharing of the burden of caring? Will the pressures of a global economy and competitive markets prompt

the evolution of a more egalitarian family structure? Or will it in fact produce community care structures?

As yet there is little evidence of any of this change. What is actually happening is that there is a sharp rise in the intensity of women's labour. Three studies in India undertaken by CEHAT as part of a multi-national project show these trends vividly. In Ambattur, a region which was predominantly agricultural but is now being drawn into rapid industrialisation, women have found new work opportunities even as agricultural work is diminishing. While this is bringing home more income and providing some extras which go to fulfil lifestyle aspirations, it has not meant any change in the perception of women's status, nor of their work-load in the family. For instance, such are the time-schedules of wage-work in a distant industrial area that women do not find time to eat adequately or even at all for that matter before they begin the day's work. This will have inevitable consequences for their health in the future. In another, quite a different, environment the expansion of grape cultivation for exports has expanded wage opportunities for skilled labour which is provided by groups which were formerly nomadic with a visibly more egalitarian social structure. And while women draw equal wages for equal work and are even able to exercise control over their earnings and decide on expenditure patterns, they continue to be the care-givers. When there are the old, the ill or the very young to be looked

after, it is the women who, if they are not able to cope, are forced to withdraw from the lucrative grape work. The situation is no different in an urban community which has suffered from closure of industry and whose members have been forced to find employment in the informal sector. Here too, women not only carry the burden of house-work and provide care for the old and the infirm, but are often assumed to take on similar roles in their place of work as well. The workplace therefore demands not only wage-work but 'family' work as well, placing thus a triple burden on women. Significantly, although the situations and the work that women are being drawn into are very dissimilar, the consequence for women and the work that they do in the family has been comparable.

The lack of development of alternatives to family-care has not had a serious impact on the state or on the economy only because women have continued to stretch their energies to bear the double and triple burdens. In an economy in the throes of rapid development, the nature of wage-work available to women will most certainly be more intensive and highly competitive. Such circumstances will in time make for a sharp deterioration in women's health which interventions such as vitamin supplementation or even the provision of health care services will not mitigate. While there is an urgent need to give greater attention to providing social support services, the real change required is in the value systems of patriarchal society.

NATIONAL ACCOUNTS STATISTICS OF INDIA 1950-51 TO 1996-97

Data for 47 years in each of the 40 revised and updated table series on different dimensions of national accounts aggregates are presented. On state domestic product, for the first time statistical series on both net and gross SDP in respect of all 25 states and three union territories for 17 years from 1980-81 to 1996-97 are available. Descriptions of the concepts involved and methods and procedures of data compilation adopted have been further expanded; likewise the extensive references to the analytical literature on national accounts and related literature.

Improvement in market sentiment brought about by the economic recovery and the election results led to surges in equity prices on both BSE and NSE. Sensex crossed the 5000 mark on October 8 when it touched an intra-day all-time high of 5091.24 points and closed at 4981.74. NSE witnessed a record turnover of Rs 4,193 crore on the same day. The rally was also helped by upgradation of the country's sovereign rating outlook from stable to positive by Moody's.

BAJAJ AUTO

Danger Signal

BAJAJ AUTO, the leader in the two-wheeler segment of the automobile industry, fared well in 1998-99. While net sales increased by 11.7 per cent, operating profit improved by 7.9 per cent over the same period. A sharp fall in interest charges (down 45.2 per cent) coupled with a drop in depreciation (lower by 7.6 per cent) helped the company post a 19.5 per cent rise in its bottom line. Though earnings per share rose from Rs 38.8 per share to Rs 46.3 per share, the company did not raise the dividend rate but maintained it at 80 per cent.

The company produced 13,81,765 two-wheelers and three-wheelers (including CKD packs), as against 13,54,482 units produced in the previous year, representing an increase of 2 per cent. Sale of two- and three-wheelers increased by 6.7 per cent over the same period. The company's market share in the scooters segment moved up marginally from 64.49 per cent to 64.81 per cent, while that in the three-wheeler segment improved from 82.08 per cent to 83.64 per cent.

Meanwhile, for the first four months of 1999-2000, the company has seen a reversal in trend. Offtake of vehicles dropped by 12 per cent over the corresponding period last year. Turnover and net profit for the first quarter were also lower than that in the first three months of the previous year. Apparently, there has been a declining preference for scooters in the two-wheeler market over the last five years. While scooters accounted for 47 per cent of total two-wheeler sales in 1992-93, this share has been gradually declining over the years and was down to 39 per cent in 1998-99. In the same period, motorcycle sales have increased from 25 per cent in 1992-93 to 41 per cent in 1998-99.

To give Bajaj Auto its due, the company did try to reduce its dependence on scooters and reduced this share from 72 per cent of its total two-wheeler sales to 60 per cent. However, to draw more than 50 per cent of its turnover from a product that is constantly losing market could still prove to be dangerous for Bajaj Auto. Though

the company has managed to increase the proportion of motorcycles in its total two-wheeler sales from 18 per cent in 1992-93 to 36 per cent in 1998-99, the lack of choice in its offerings in this segment has hampered its progress over the years. Consequently, competitors like Hero Honda and TVS Suzuki have gained in terms of market share at the cost of Bajaj Auto. Unless the company gets its act together, it could be headed for tough times over the years to come.

APOLLO TYRES

Capacity Expansion

Apollo Tyres performed poorly in 1998-99. While net sales declined by 16.1 per cent over the previous year, the company's operating profit fell by 8.8 per cent and net profit was lower by 23.6 per cent.

The Indian tyre industry is characterised by high capital investment, large volumes, wide geographical spread, diverse range of products and low profit margins. The industry is presently going through a recession and replacement market growth is low as tyres are a low involvement product. The fall in demand for automobiles has also affected offtake. To make matters worse, Apollo Tyres lost 100 days of production in the first and second quarters following a lock-out at its Perambra plant due to labour unrest. The company's Baroda facility was also closed for 15 days in the third quarter for maintenance and upgradation work. Also, during the year the company settled indirect tax disputes of approximately Rs 9 crore under the Kar Vivad Samadhan Scheme and paid Rs crore towards a voluntary retirement scheme introduced to optimise its staff strength.

Meanwhile, the company now plans to create a manufacturing capacity of 2,000 passenger radial tyres per day at its Gujarat unit as part of its expansion drive. The increase in capacity is expected to cost the company nearly Rs 100 crore. Apollo Tyres has already increased the bias truck and rear tractor tyre capacity at its Limda plant in Gujarat in order to ensure continuous supply to the market and to create flexibility of operations. The company has also created a capacity of nearly 50,000

two- and three-wheeler tyres per month at its conversion unit. Further, the company has already raised funds through a preferential issue of partly convertible debentures in order to part-finance its plans to manufacture passenger radial tyres at Limda.

Apollo Tyres now plans to set up a steel radial truck tyre unit at a cost of approximately Rs 400 crore in partnership with Continental Tyres, which is the fourth largest tyre company in the world. The latter is expected to provide technology transfer and consultancy for setting up the unit. The project is expected to be completed in 18 to 24 months and Apollo Tyres is also considering the possibility of converting the project into a joint venture with its foreign partner.

Apollo Tyres has today emerged as the premier truck tyre producer in the country and is now focusing on tractors, light commercial vehicles, cars and two-wheeler tyres. It commands almost 21 per cent of the truck tyre market which is expected to grow by over 20 per cent during the current year, after a 14-15 per cent growth in 1998-99.

ATUL

Rescued by Other Income

Incorporated in 1947, Atul belongs to the Lalbhai group of companies and is engaged in the manufacture of dyes and dye intermediates, aromatics and chemicals. In 1998-99 Atul witnessed a mixed performance on the financial front. While net sales increased by 16.5 per cent over the previous year, operating profit declined by 1.6 per cent over the same period. However, a sharp increase in non-operating income coupled with a marginal fall in interest charges (down 2 per cent) helped the company post a 68 per cent rise in its bottom line.

A consistently disturbing factor in the company's performance is its dependence on other income in order to declare a net profit. While the company earned Rs 30.8 crore on account of profit from the sale of investments in 1997-98, this amount touched Rs 49.5 crore in the year under review. But for this profit, the company would have been deep in the red.

NA: means not available.

Oblivious to this predicament, the company has raised its dividend from 10 per cent in the previous year to 15 per cent. The company's stock presently quotes at around Rs 23 on the bourses, discounting its 1998-99 earnings by a mere three times, reflecting the poor investor fancy for the scrip.

The company's lacklustre performance can be attributed to the subdued state of the dyes and dye intermediates market during the year. Sale of dyes and dye intermediates fell drastically from Rs 114.8 crore in the previous year to Rs 78.2 crore, representing a drop of 31.9 per cent.

The only silver lining for the company was the fact that its aromatics division performed well. This division draws a major part of its turnover (56.4 per cent) from para anisaldehyde which is produced in relatively small quantities but goes into a hugely successful end-product. The company is the world's largest producer of this chemical and commands a global market share of 35 per cent. Para anisaldehyde is a vital ingredient for sunscreen lotion and has helped the company boost its foreign exchange earnings over the years. For the current year, the company's exports were higher by 15 per cent with fob. value of forex earnings touching Rs 176 crore. Atul is the only manufacturer of the chemical in the country and competes with American chemical companies such as Merisol.

Supply and demand for para anisaldehyde are more or less balanced currently and an increase in capacity could only lead to a fall in prices. Keeping this in mind, the company is moving into downstream products like para aniside alcohol, which is used in the manufacture of perfumes.

Another product that scores high on the company's profitability list is carbamate which is manufactured by its agrochemicals division. Carbamate is a chemical which is used in making detonators used in warfare. Though this division accounted for Rs 34 crore of the company's turnover in 1998-99, Atul hopes to increase this to Rs 80 crore in 1999-2000. The company also plans to begin manufacturing glyphosate, which is the world's largest selling herbicide formulation. The company has already formed a 50:50 joint venture with Chinese herbicide major Rotam for marketing the product in the international market.

Free Speech and 'Provocation'

A G Noorani

Intolerance of dissent from the orthodoxy of the day has been the bane of Indian society for centuries. But it is precisely in the ready acceptance of the right to dissent, as distinct from its mere tolerance, that a free society distinguishes itself.

IT is nearly four months now since PTV (Pakistan's TV) channel was taken off the air unconstitutionally as it was then pointed out ('Ban on Pak TV', *EPW*, June 12, 1999). The minister for information and broadcasting, Pramod Mahajan, had said that the ban would be lifted after the crisis was over. It was over by July 11. The ban was not lifted. This reflects our establishment's attitude to free speech. It is a 'provocation' if it clashes with the views of some. But they are not taught to be tolerant. It is free speech which must be curbed.

In his classic on *Freedom of Speech*, Eric Barendt of Oxford University has incisively discussed the law on this aspect:

It is, of course, understandable that laws should be enacted outlawing the use of unpleasant and offensive words in public. Few people enjoy the sound of foul language, particularly when directed at them, any more than they like the sight of ugly buildings. But acceptance of the special value of freedom of speech entails that we should be more prepared to tolerate the former than the latter type of unpleasantness... If the gravamen of the offence is the hurt to sensibilities of the person addressed, use of the criminal law is hardly compatible with respect for freedom of expression. *Listeners would then have some sort of veto and the implications for freedom of political speech would be considerable*

Foul language is the jargon of fascists who detest free debate. True enough that sheer abuse or racial or communal libel is not permissible. The true test is whether the speech is a real provocation to violence. The sensitivities of the listeners are relevant only in this context. As the Supreme Court of India has ruled, it is the duty of the state to uphold the exercise of the right to free speech and to suppress violence intended to stifle it.

On July 23, 1999 the Queen's Bench Divisional Court of England, comprising Lord Justice Sedley and Justice Collins, delivered a most important judgment on this aspect of the law on free speech in

Redmond-Bate vs Director of Public Prosecutions. It held that free speech included not only the inoffensive but also the irritating, the contentious, the eccentric, the heretical, the unwelcome, and the provocative as long as such speech did not tend to provoke violence.

The facts and the statement of the law are drawn from a report in *The Times*, London, of July 28, 1999. On October 2, 1997 Alison Redmond-Bate had been preaching on the steps of Wakefield Cathedral to passers-by in the street. In response to a complaint, police constable Tennant approached her and other women preachers. No crowd had gathered. Yet, he warned them not to stop people. Since they were not stopping people he left. He later returned to find that a crowd in excess of a 100 people had gathered. Some members of the crowd were showing hostility towards the speakers.

Fearing a breach of the peace, Tennant asked the women to stop preaching and, when they refused, arrested them for breach of the peace. The court held that it was irrational and illiberal to believe that she and her colleagues would have caused a breach of peace and quashed their conviction by a magistrate on this charge. The constable was not acting in the execution of his duty when he required the women to stop preaching and the defendant was

therefore not guilty of obstructing him in the execution of his duty when she refused to comply.

The court pointed out that free speech included not only the inoffensive but the irritating, the contentious, the eccentric, the heretical, the unwelcome and the provocative provided it did not tend to provoke violence. Freedom only to speak inoffensively was not worth having.

What the Speakers' Corner, where the law applied as fully as anywhere else, demonstrated was the tolerance which was both extended by the law to opinion of every kind and expected by the law in the conduct of those who disagreed, even strongly, with what they heard.

The court recalled that from the condemnation of Socrates to the persecution of modern writers and journalists, our world had seen too many examples of state control of unofficial ideas. A central purpose of the European Convention on Human Rights had been to set close limits to any such assumed power. (The same, of course, is true of the International Covenant on Social and Political Rights and indeed, of the Constitution of India.) The judges said, "We in this country continued to owe a debt to the jury which in 1670 refused to convict the Quakers, William Penn and William Mead, for preaching ideas which offended against state orthodoxy".

This has been the bane of Indian society for centuries – the intolerance of dissent from the orthodoxy of the day. But it is precisely in the ready acceptance of the right to dissent, as distinct from its mere tolerance, that a free society distinguishes itself. Justice Oliver Wendell Holmes prescribed the test in these telling terms – liberty not to those who agree with us; but, freedom to the idea that we hate.

Portents of a Liquidity Squeeze

With government borrowing this year threatening to exceed even last year's record level, the pick-up in demand for commercial credit from banks and bank deposit growth beginning to slacken, the signs of a liquidity strain in the second half of the year are unmistakable.

I The Backdrop

THERE are clear indications that the banking industry would face some liquidity strain in the second half of the year. Last year, from August 18, 1998 onwards, there were Resurgent India Bonds (RIBs) worth Rs 17,945 crore included as term deposits with banks which helped the system to accommodate a historically high level of market borrowings by the government (Rs 62,900 crore). Fiscal compulsions suggest that the current year's borrowings, though budgeted lower, are likely to be higher still. Hitherto, this year the RBI has taken on itself through devolvement/private placement a burden of as much as Rs 23,500 crore (43 per cent) out of

total market loans of Rs 54,130 crore but at the same time sold to the market through open market operations as much as Rs 24,619 crore. Such operational manoeuvrability will be limited in the months ahead when there would not be any special accretion of liquidity into the system.

Secondly, there has begun a pick-up in the demand for commercial credit which the commercial banks seem to have slowly begun to entertain. There is already a turn-around of Rs 5,300 crore in non-food credit in this fiscal year so far compared with the previous year and in the next half of the year, the demand for bank credit is likely to be even higher, going by the signs of industrial recovery.

Thirdly, bank deposit growth has already begun to slacken. Net of RIB funds, aggregate deposits have so far up to September 10, 1999 grown by 5.1 per cent as against 5.5 per cent in the corresponding period last year. This growth is likely to be further affected by the reported increases in the total amounts of funds mobilised by all categories of mutual funds comprising those from the public and private sectors and the UTI. It is reported that due to a noticeable revival of the primary as well as secondary segments of the capital market (particularly those of IT and software companies, pharmaceuticals and consumer durable industries), the funds mobilised by the mutual funds during the first five months up to August this year have far

exceeded the annual mobilisations of Rs 3,060 crore and Rs 4,002 crore made by the mutual funds during the previous two full years. Such mobilisation is also routed through the banking industry, but they do not help the banks to create any substantial durable assets.

EVALUATING PDs' PERFORMANCE

During the month, four primary dealers (PDs) published their balance sheets for 1998-99. The RBI introduced the system of primary dealers in 1996 with the objective of "strengthening the market infrastructure and making it liquid and broad-based, developing underwriting and market making capabilities for government securities, improving trading in the secondary market, widening investor base and making PDs an effective conduit of OMO". The PDs are obliged to make a minimum annual bidding commitment for dated securities as well as treasury bills (TBs) and achieve a minimum success ratio. They are also obliged to underwrite the gap between the subscribed/accepted and the notified amount where there is a shortfall.

The number of PDs increased from 6 to 13 in 1998-99 and one more has been added to the list on September 23, 1999. The new PDs have included some players in the private sector. They, however, became operational only after March 1999. Analysis of operations of the 6 PDs, indicates that their performance in terms of bidding was higher than their commitment. Their success ratio, that is, bids accepted out of bids submitted, was 49 per cent and 53 per cent in TBs and dated securities, respectively. As against the bidding commitment of Rs 16,350 crore and Rs 26,900 crore, respectively, in Treasury Bills and central government dated securities in the primary market, the

GRAPH A: DAILY TOP-END QUOTATIONS OF CALL MONEY RATES, SEPTEMBER 1999

GRAPH B: SPOT QUOTATIONS FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET, SEPTEMBER 1999

II Call Money and Forex Markets

The overnight money market generally faced firmness during September. With a spillover of the impact of sizeable RBI's open market operations (OMOs) on market liquidity in the closing days of August, the call money rate remained firm in the range of 9 to 11 per cent in early September. The firmness was sustained on expectations of a large possible outflow of funds except for one day on September 9 when excess subscriptions for state loans were refunded. The third week of the month saw a further hardening of the call rates to a high of even 12.50 per cent (Graph A) following a substantial outflow on account of advance tax payments (Table 2). As a result, the primary dealers and foreign banks quickly drew upon RBI refinance; the outstandings of loans and advances by RBI to scheduled commercial banks, primary dealers and others shot up from about Rs 8,267 crore as on August 27 to Rs 17,984 crore as on September 17. Subsequently, with the return flow of tax funds and inflows on account of coupon payments on some securities and maturity amount of floating rate bonds on September 29, call rates softened and came back to the floor level of 8-8.50 per cent (Tables 3 and 4).

The foreign exchange market was by and large calm with the rupee rate ruling at Rs 43.45 per US dollar in the first fortnight with a nominal loss in value to around Rs 43.55 per dollar in the second half of the month (Graph B). The latter occurred due to a sudden and sharp appreciation of the US dollar vis-a-vis the Japanese yen and not due to any of India's domestic factors. The turnover in the forex market was more moderate in September than in the previous month, both in merchant and inter-bank segments. As a result, there has been pressure on the RBI to relax forex operations including the facility to rebook cancelled forward contracts. On the other hand, in the absence of a strong export growth, the external sector remains vulnerable. As it is, the rupee stands depreciated by about 2 to 3 per cent since July both in nominal as well

actual bids tendered by PDs were higher at Rs 32,134 crore and Rs 25,024 crore, respectively. Of these, the bids accepted were Rs 15,652 crore for Treasury Bills and Rs 13,252 crore for central government dated securities. The RBI accepted Rs 28,848 crore out of Rs 69,709 crore offered by PDs for underwriting. PDs purchased 19 per cent of the total issues in dated securities in the primary market and 40 per cent of total issues in TBs.

The underwriting fees/commission paid to PDs amounted to Rs 83.31 crore this year against Rs 110 crore of the previous year. All the PDs by and large recorded lower profits in 1998-99. Gilts Securities Trading Corporation, for instance, recorded a profit of Rs 25.12 crore in 1998-99 against a profit of Rs 25.25 crore of last year. DFHI has recorded a profit of Rs 58.41 crore this year against Rs 67.92 crore last year, whereas STCI has reported a profit of Rs 82.98 crore this year as against Rs 98.36 crore last year.

The PDs attributed the lower returns to

falling yields on government securities. They also blame the Reserve Bank of India for adopting the private placement-cum-open market operations strategy for issuing new securities. This allegedly deprives them of their earnings as also stocks of government securities. They have been urging the RBI to revise its strategy to help PDs in their business. PDs have also urged the RBI to increase the amount of refinance made available to them, remove the collateral clause (which is not possible under the RBI Act) and also reduce the interest rates at which they can avail of the refinance.

The extent of the PDs' dependence on the call money market funds may be gauged from the data presented in Table 1. The six GPDs borrowed Rs 2,047,478 crore on daily product basis during the whole of 1998-99, that is, a daily average of Rs 5,610 crore against their daily lending of Rs 2,370 crore. Their networth stood at Rs 1,530 crore as at the end of March 1999.

Figures in parentheses represent weekly range during similar period last year.

as real terms against major currencies. In forward transactions, the money market tightness has resulted in a slight firmness in the annualised forward premia, but such firmness has been more in short-term one-month premia than in say, the six-month ones (Graph C), thus giving rise to a flat forward premium curve.

Incidentally, the RBI's recent directive to the Foreign Exchange Dealers' Association of India (FEDAI) to let the latter's member banks have complete freedom in fixing service charges on various types of forex dealings, thus abolishing free brokerage charges, etc, may result in squeezing margins of brokerage firms and consolidation of the brokering business in the forex market.

III Primary Market

Dated Securities

The RBI announced a state loan issue for September 8. The notified amount for this 11.85 per cent 2009 bonds was Rs 3,250.08 crore for 23 states. The total subscription received for this loan was Rs 4,230.70 crore. The RBI refunded the excess subscription. The total net issuance of state loans this year so far has been Rs 9,482 crore (including the auction issues in respect of three states) as against the total net issuance of Rs 10,694 crore last year. Yet another tranche of state loans is due in the second half of the year.

An auction of central government

securities was announced on September 28 mainly to absorb the redemption amount of Rs 3,000 crore of the floating rate bonds. The bond to be auctioned was a reissue of the 12.32 per cent 2011 paper. The cut-off price for the paper was fixed at Rs 103.57 which meant a yield of 11.74 per cent. Prior to the auction, the paper was being traded at Rs 103.62/64. The RBI received 228 bids for an aggregate amount of Rs 5,853 crore and accepted 90 bids for the notified amount of Rs 2,500 crore. The underwriting commission for PDs was fixed at five paise per Rupee 100. This was the fourth time this paper was being reissued which has raised its outstanding level to Rs 11,000 crore, but the implicit yield at successive reissue has been brought down from 12.32 per cent to 12.05 per cent and then to 11.96/97 per cent and finally to 11.74 per cent, which is reflective of the successful attempts made by the RBI to reduce primary yields on dated securities in the recent past.

So far, about 86 per cent of net market borrowings of the central government have been completed but as proportion of the budget for gross borrowings only 75 per cent have been accomplished as there are substantial repayments worth Rs 12,702 crore due in the subsequent months of the year. Thus, to meet the target of net borrowings of Rs 57,461 crore, the government will have to resort to a gross borrowing of Rs 20,884 crore until the end of the year.

What is more, if recent experience is any guide the budgetary compulsions may make the government to borrow far beyond the budgeted provisions, essentially because the borrowings from the RBI

GRAPH E: YIELD CURVE FOR DATED SECURITIES: DAY OF MAXIMUM TRANSACTIONS (SEPTEMBER 21) DURING THE SECOND HALF OF SEPTEMBER 1999

through ad hoc TBs have been eschewed and ways and means advances have been restricted to Rs 11,000 crore for the first half but only Rs 7,000 crore for the second half of the year. It seems as though the market borrowings have replaced borrowings from the RBI. During 1998-99, there were Rs 14,577 crore of extra borrowings from the market beyond the budgeted amount (Table 5).

Treasury Bills

The RBI was hard put to avoid an increase in the cut-off yields on treasury bills, all of which remained unchanged during the September auctions except for a fractional rise in the yield on 364-day TBs. This was achieved by the RBI by opting for huge devolvments on itself. Of the total TBs issuance of Rs 1000 crore in the first half of the month, the RBI took Rs 920 crore worth of devolvement. In the second fortnight, the devolvement at Rs 458 crore was much lower. Interestingly, the non-

competitive bids spurted to Rs 2,350 crore indicating that the states have invested the freshly raised sum into this paper (Tables 6 to 9).

Bonds Market

In conformity with the receding tempo of commercial debt issues since the beginning of the current fiscal year, there has been a further drastic fall in the number and amount of fresh issues in September. A few other qualitative changes discernible of late in the debt market were reinforced in this month: near absence of any issues from Central PSUs and all India FIs; quantum jump in funds mobilised by state-level undertakings on infrastructure projects; some improvement in the share also of private corporates; and some moderation in the coupon rates offered on bonds of comparable maturities and borrowers.

The total amount of bonds proposed to be raised during the month has been a low of Rs 1,341 crore (including greenshoe

options) contrasted with previous month's figure of over Rs 5,000 crore. State-level undertakings yet again dominated the market this month with a size of Rs 1,033 crore followed by private corporates (Rs 190 crore) and finally HDFC (Rs 50 crore), one bank (Rs 18 crore), and one NBFC (Rs 50 crore).

Interestingly, all the issues among the state-level undertakings have been of traditional seven-year maturity, guaranteed by the respective state governments and offering coupon rates in the range of 12.5 per cent to around 14 per cent. The highest coupon of 14 per cent payable annually was offered by Uptron Powertronics of the UP government and the lowest rate of 12.5 per cent came from the Gujarat State Fertilisers and Chemicals. The best yield, however, was offered by Madhya Pradesh Electricity Board's (MPEB) privately placed paper at 14.17 per cent which had offered a half-yearly coupon rate of 13.7 per cent, followed by the unrated instrument

of the WB Industrial Development Finance Corporation (WBIDFC) 14.05 per cent which offered 13.6 per cent rate of coupon. The most attractive YTM of the month is, nevertheless, lower by 22 basis points from the previous month's highest yield offered by Sardar Sarovar Narmada Nigam (SSNNL) which was at 14.39 per cent on its 10-year paper and lower by 16 basis points from the one offered by AP Transco on its paper of 10-year maturity which was at 14.33 per cent.

There were three issues from the government of Maharashtra's irrigation projects, namely, Konkan (Rs 48 crore), Tapi (Rs 150 crore) and Godavari (Rs 150 crore) Irrigation Development Corporations – collectively aiming to raise Rs 348 crore through 7-year paper guaranteed by the government of Maharashtra. All the three issues were identically structured, AA-(so) rated by Care and offered interest rate of 13.5 per cent payable half-yearly with YTM working out to 13.96 per cent. They are getting good response from the investors and KIDC is reportedly heading toward closure after successfully meeting with the targeted amount. MP Electricity Board was in the private placement segment to raise Rs 300 crore (including Rs 100 crore as green shoe option) with 13.7 per cent rate of coupon at the annualised yield of 14.17 per cent. Supported and guaranteed by the UP government was a small issue from Uptron Powertronics to collect Rs 5 crore with an option to retain an oversubscription of equal amount at 14 per cent rate of interest. The issue has been fully subscribed. Other issues from the state governments were those of WB Industrial Development Finance Corporation (WBIDFC) – Rs 200 crore – and Gujarat State Fertilisers and Chemicals – Rs 125 crore.

HDFC placed its 5-year paper at an annual coupon rate of 12.15 per cent to collect Rs 50 crore. Dhanalaxmi Bank was in the market with 13 per cent 67-month paper to raise Rs 18 crore. A similar small amount of Rs 50 crore issue was privately placed by Sundaram Finance; on the offer was 12 per cent 3-year non-convertible debentures (NCD) and it was exclusively placed with mutual funds. For the issue size of Rs 50 crore, contributions from Birla Mutual Fund was Rs 25 crore, DSP Merrill Lynch Rs 20 crore and Kothari Pioneer Rs 5 crore.

Among the private corporates, Ashok Layland entered the market with 12.5 per cent NCD to collect Rs 90 crore. The issue collected the targeted amount and was closed within a day of opening. It was largely subscribed by mutual funds and financial institutions (FIs).

There were many state-level issues in the market which made entry in August but continued to remain open this month as well. They were RSFB, UPFC, SSNNL, AP Transco, REC and finally VIDC which opened on July 26 but in view of sporadic and uncertain demand for its 7-year paper, the closing date had been extended twice; there has been an upward revision in the size of the issue as well from Rs 250 crore to now Rs 400 crore and it has reportedly collected Rs 300 crore to the last count.

Among the issues closed, UBI's 84-month sub-ordinated paper was very successful and was probably the first ever subordinated debt issue through book-building route by any nationalised bank. The issue which hit the market on August 30, collected Rs 500 crore at a cut-off yield of 12.5 per cent after having indicated a band of 12.3-12.6 per cent. So were other issues closed successfully like Bank of Maharashtra, Hongkong Shanghai Bank, National Housing Bank, MTNL, TNEB, RSRTC, KRC, etc. All the issues met with the targeted amount with some getting oversubscription. Collectively, the closed issues reported to have raised over Rs 5,000 crore.

The coming week will witness an issue from Maharashtra Jeevan Pradhikaran. The issue will have four instruments of 10-year (with coupon of 14 per cent for the first

year and subsequently 2 per cent over the PF till maturity), 7-year (13.25 per cent), and two options of 10-year each at 13.25 per cent with different redemption options. TISCO is also likely to place its 8-year regular bonds to mobilise Rs 150 crore with an indicative band of 12.50-12.70 per

(-) means no trading. YTM = Yield to maturity in percentage per annum. CY = Current yield in per cent per annum. Securities with small-size transactions (Rs 5 crore or less) and inflation linked bonds have been dropped from the above list but included in the respective totals.

Notes: (1) Yields are weighted yields, weighted by the amounts of each transaction.

(2) Current yield has not been worked out for treasury bills.

cent such that the final rate would be decided through book-building process.

Securitisation

While the RBI worked on the guidelines and report on securitisation, HUDCO entered into a three-year reversible securitisation deal with Vijaya Bank to raise funds for meeting some of its infrastructure financing commitments. According to the deal, HUDCO will receive Rs 200 crore from Vijaya Bank for securitised urban infrastructure receivables from various state urban development authorities and municipalities for a period of three years. During this period, the deal will remain on a non-recourse basis. That is, Vijaya Bank will take the credit risk and will receive all payments including tax benefit. After this period, HUDCO will be able to buy back the receivables at interest rates prevailing at that time. HUDCO discounted the 16 per cent receivables at 13 per cent.

Meanwhile, SEBI was reported to have approved the concept of mutual funds floating dedicated schemes to buy securitised debt from financial institutions. The concept envisages mutual funds raising funds from investors for the sole purpose of investing in securitised debt.

Other Instruments

The commercial paper (CP) market remained dull in the first fortnight of

September due to high call rates. CP rates also moved up to above 10 per cent for 90-day paper. Companies such as, NRB Bearings and Sony were seen to be placing their 90-day papers in the market at 10.25/35 per cent. As per the data released by the RBI, the total amount outstanding and the new issues of commercial paper showed a drop in the fortnight ending September 15; the total outstanding amount as on this date fell to Rs 7,293 crore from Rs 7,678 crore in the previous fortnight, whereas the new issues reported during the fortnight dropped to Rs 786 crore from Rs 1,535 crore. The interest rates on this instrument ranged from 9.61-12.70 per cent which were marginally higher than the rates prevailing during the previous fortnight. A year ago the outstanding amount was Rs 4,803 crore.

The data on certificate of deposit (CDs) also continued to be low. As on August 13, the outstanding amount under CDs was reported to be Rs 3,375 crore and the new issues during the fortnight were Rs 48 crore. The interest rates on this instrument ranged from 6.50-11.00 per cent.

IV Secondary Market

Gilt-edged market

The prices and yields of dated securities in the secondary market behaved differently in the first half as compared

with the second half of the month in response to liquidity conditions. The first half saw a drop in prices and a rise in yields due to tight liquidity conditions, which were somewhat reversed in the second half following the easing of liquidity. In the first period, however, the variations in the prices of medium- and long-term maturity segments were considerably higher than in the short duration segments, thus rendering the yield curve steeply upward sloping (Graph D). Prices of short-term securities dropped by an average of 15-16 paise and those of medium- and long-term securities fell on an average by 29.30 and 40-42 paise, respectively. In the second half, on the other hand, the prices of these segments rose relatively uniformly by around 5-6 paise which helped to retain the upward sloping nature of the yield curve (Graph E). The spread between the weighted average of YTM for a top traded one-year security and that for a similarly traded 10-year security has narrowed to about 1.10 percentage points from over 2 percentage points a year ago. (For relevant yield rates, see Appendix Table.)

Repos and OMO

With call rates at around 10 per cent, the 6 per cent fixed yield repos of the RBI received no response throughout the month. Repos even outside the RBI were on a moderate scale (Table 10). During September, OMOs remained quite subdued during the first two weeks with sales worth only Rupees 1 crore in the week ended September 10 and Rs 13 crore in the week ended September 17; however, in the last week of the month when the RBI offered to sell the long-dated 12.75 per cent 2006 and 12.30 per cent 2016 securities at Rs 102.66 and Rs 102.60, respectively, there were Rs 1,104 crore worth of OMOs in the week ended September 24. The RBI's OMO sales aggregated Rs 23,515 crore as on September 17 during the current financial year.

WDM of NSE

There was a drastic reduction in the wholesale debt transactions of the screen-based NSE due to liquidity constraint in the market. The secondary market dealings in PSU bonds fell sharply from Rs 154 crore in August to Rs 89 crore in September. There were, however, a relatively higher activity in CPs following a revival of their primary issues (Table 11).

[The background work for this review was done by V P Prasanth, Rafiq L. Ansari and Dipti Parikh.]

Two Eras and After

People's Republic of China at 50

Alka Acharya

The legacy of the last 50 years of the People's Republic of China comprises two decades of revolutionary mass mobilisation; two decades of reforms, a 'lost decade' in between. Seemingly, there can be no turning back. But, as the Chinese continue to hurtle on the Dengist road of market reforms, sometime, somewhere, they will have to pause and figure out exactly where they are headed.

THE Third Plenary Session of the Eleventh Central Committee (CC) of the Communist Party of China (CPC) in December 1978, is generally considered as the point of departure from the Maoist era in the history of the People's Republic of China (PRC). This was the juncture that marked Deng Xiaoping's consolidation of control within, and consolidation of the leadership of the CPC. The People's Republic of China then embarked on a series of economic reforms, which amounted to no less than a total reversal of the earlier policies and would radically transform the face and character of Maoist China. It also signified China's intention to put an end to its global isolation and take what it considered its rightful place in world affairs. In effect, the Maoist period had drawn to a close and the era of Deng Xiaoping had begun.

There would be virtually no disagreement with the statement that the reforms of the last 20 years have transformed the face and character of Mao's China; in fact in many quarters, there is a tremendous fascination with and admiration for China's remarkable achievements. However, there are few efforts directed towards a systematic and thoroughgoing examination and analysis of the factors underpinning the success of the reforms. The necessity for such an exercise appears all the more urgent, particularly when the magnitude of the changes is seen in a comparative context. In India particularly, many questions concerning the Chinese reforms are routinely raised and there is a sense both of awe and curiosity, which gets heightened by the uncertainty that the uneven results of the liberalisation policies generate.

It would indeed be absurd to deny either the immensity of the transformation or the intensity with which it was sought to be brought about – either in the Maoist or the post-Mao period. Beginning in 1949,

the CPC led the country through a thorough restructuring of the social fabric and a total uprooting of earlier politico-economic structures, discarding in the process as well, traditional patterns of thought and relationships. Fifty years in fact appear to be at times much too little when we consider that there is virtually no example in the colonised or the developing world which can boast of a similar record. Moreover, the PRC also managed to overcome major domestic upheavals; emphatic and repeated reversals in developmental strategy; and dramatic – at times excessively so – power struggles at the very apex of the political system. The last major upheaval a decade ago on Tiananmen Square, had led western analysts to seriously predict the break-up of the PRC and/or the rise of regional separatist movements, which do not appear to be of much consequence or significance in western prognoses for China today.

At 50, the PRC has a population which has more than doubled since 1949 and a GNP which is in trillions of yuan. Between 1978 and 1992, the average annual growth rate of real GNP was almost 9 per cent – which is easily the highest in the world. Life expectancy has also more than doubled and infant mortality has declined to 30 deaths per thousand births; illiteracy has been more than halved – standards of living in general have risen. While urban incomes and job opportunities have, as a consequence of the market reforms, expanded and diversified enormously, peasant annual incomes have trebled and in some cases, more than quadrupled. Urban population also more than doubled as in the first decade of the reforms itself, the more prosperous big villages became towns and nearly 30 towns came up as large new cities while 10,000 new kilometres of roads were laid. The PRC has emerged as the largest recipient of foreign direct invest-

ment and it leads the world in exports, sending \$70 billion worth of goods to the US alone in 1998. It is unarguably the dominant military power in the region and over the last decade, through a skilful combination of economic and commercial diplomacy, established itself on a sound footing with the majority of nations on its periphery. It is unhesitatingly viewed as one of the major global actors in a multipolar world; is one of the five permanent members of the United Nations Security Council and, as it takes great pains to establish on every possible occasion, is a responsible and responsive member of the global community.

It may be recalled however, that the growth record of the first 25 years of the PRC appears no less impressive: industry grew at a rate of over 10 per cent, agriculture by 4 per cent, grain output by 3.7 per cent and the overall GNP by 6.5 per cent. Institutions such as the World Bank on the one hand and independent economic analysts – both western and non-western – on the other, by and large tend to identify a similar set of factors and attributes which distinguished the Chinese economy in the seventies and contributed to the extraordinary success of the reforms. The high rates of savings and investments; the unusually high levels of literacy, particularly at the primary and secondary levels of education and high life expectancy rates – both of which are universally admitted to have been due to the measures adopted and structures established in the 1950s and 1960s; and relatively low levels of income inequality. China moreover had the lowest number of people living under the poverty line in the developing world. The Maoist period also saw the massive – if questionable – use of human capital, for the creation of extensive infrastructure, which proved invaluable during the reform period. Even the critics of Maoist policies admit that the poor of China emerged significantly better-off than the poor of most other developing countries and that the egalitarian goals were to a remarkable degree, fulfilled.

Thus, when Deng Xiaoping took charge of China's destiny and embarked on the reforms which were to reorient the direction of China's 'second' revolution, he did not do so in a vacuum. He built on an extremely concrete domestic socio-economic and political legacy, in an international context of globalising capitalist forces. It has been pointed out that despite

the achievements of the earlier decades, the Chinese economy had reached a plateau by the early 1970s and that the standards of living of the people had shown no noticeable improvement. Attempt to push up the savings rate was no longer possible. The worldwide recession of the early seventies had moreover led to a sharp fall in the demand for Chinese exports which were also seen as highly uncompetitive. The only way they could achieve a qualitative breakthrough in the economy was by bringing in large amounts of capital and superior technology and this could only be done by opening up to the outside world and by the initiation of structural adjustment programmes.

There is a view taken by some that market reforms were not necessary which is not only debatable, but in any case, a moot point now. We are dealing with a China in the throes of modernisation and reform. As a matter of fact, we in the developing world are all modernising – the crucial point is that we are modernising in a capitalist world. For perhaps the first time in human history, the structures and processes of development are being conditioned and controlled by the capitalist world economy. The PRC recognised and decided to tap these forces to serve its own ends, by a careful and controlled process of opening to the outside world, while retaining autonomy of decision-making much earlier than most developing countries or the erstwhile Soviet Union.

REFORMS, CHINESE STYLE

This translated into a rather unique – one may say almost unprecedented formula: market reforms with Chinese characteristics. In its first stages, this formula sought to impart some flexibility to the erstwhile centralised command economy and the total state ownership and control in the agricultural and industrial sector. Small-scale private entrepreneurship, autonomy of decision-making and small unregulated markets were allowed. Over the decades, these gradually expanded, but a combination of plan and market continued to remain and this is essentially the paradigm in which debates on the nature and direction of the Chinese economy continue to take place.

Economic policy reversals were however only half of the story. Their implications, in epistemological and politico-ideological terms unfolded in June 1981, when the Sixth Plenum of the Eleventh CC adopted a 35,000-word 'Resolution on Certain Questions in the History of Our Party since the Founding of the People's Republic'. The break with the Maoist

period was sought to be documented and enshrined as the official party position. The two notable aspects of the resolution were the verdicts that were passed on the Great Proletarian Cultural Revolution (GPCR) and the contribution and role of Mao Zedong and of course, the link between the two. The former, which lasted from May 1966 to October 1976 "caused the most devastating setback and heavy losses to the party, the state, and the people in the history of the People's Republic, and this 'Great Cultural Revolution' was initiated and led by Comrade Mao Zedong". And after giving the necessary credit for his role in the Chinese revolution, the resolution dwelled on Mao's "shortcomings and mistakes", which chiefly occurred in his later years when "he separated himself from the collective leadership of the party, often rejecting or even suppressing the correct views of others. Mistakes thus became inevitable. A long period of comprehensive, serious mistakes led to the outbreak of the 'Great Cultural Revolution' which brought the most severe misfortune to the party and the people." In other words, a clear departure was sought to be established: a definite and determined discarding of class struggle and renunciation of revolutionary mass mobilisation strategies.

The immediate political context of Deng's decisive break with the Maoist period was thus undoubtedly that 'decade of turmoil' and many of his subsequent actions have to be assessed in the light of his determination to avoid 'chaos and disorder' of the GPCR variety at all costs. In his view, while fundamental and far-reaching reforms were essential, the critical importance of a tightly organised and disciplined structure exercising authority and control over the socio-economic forces likely to be released by the reforms, could not be downplayed. Deng was thus instrumental in establishing the state's, and by implication the CPC's centrality in the Chinese political system – a centrality that was moreover highly authoritarian. This also implied that the interpretation of the official ruling ideology, and thereby the source of the party's legitimacy, was also tightly controlled. This is not to suggest that the CPC was and is unanimous on the question of reforms; there was and continues to be considerable debate on the 'how far and fast' of it. The point is that differences arose and were contained within the reform paradigm, not outside it. There is also criticism of and opposition to the reforms from the 'left', but at this point it is not an effective or strong enough force to pose any major challenge to the

dominant discourse.

Moreover, every effort was to be made to separate economic development from its political context. Whereas for Mao, economics could not be isolated from politics given the interconnectedness of the base and superstructure, Deng Xiaoping's slogan of the 1980s, "to get rich is glorious" equated socialism almost wholly with modernisation and economic development. Socialism under Deng was thus re-conceptualised as an ideology of modernisation. The objectives, in the first instance were to increase productivity, improve efficiency. This would gradually lead to an improvement in living standards and over a period of time to the development of "comprehensive national strength". In the process, the Communist Party has also evolved and metamorphosed from an organisation committed to mass mobilisation, combating bureaucratic elitism and privilege and promoting an egalitarian ethos to one in which there is a distinct technical and bureaucratic-capitalist elite as well as a group of private entrepreneurs who have considerable stakes and interests in the continuation of the reforms. It is this party which today interprets and establishes the operational content of Chinese socialism, in which process the distinction between capitalism and socialism is blurred beyond recognition. "White cat, black cat", said Deng, "if it catches mice it is a good cat."

The reforms have not been an unqualified success story. We see the emergence of regional economic imbalances, increasing poverty in the backward hinterland provinces, pervasive corruption, increased migration from rural to the urban areas, a general rise in social disorder, rising unemployment which is only likely to rise as the reforms of the state-owned industrial enterprises gathers momentum and the dominance of consumerism and materialism. The party, in the process of implementing "capitalism with Chinese characteristics" and the "socialist market economy" seems to be combining the worst of both the worlds. Many commentators have pointed out how this combination, while promoting growth at a particular stage, is becoming increasingly unsupportable. It is not only capitalism, but feudalism that is making a come-back – a development that is most strikingly seen in the rural areas. The Chinese society, after two decades of market reforms, has acquired a more complex character with the emergence of new classes. Urban society in particular demonstrates a complexity which goes beyond the limits of the market reforms. It is also a society

which is increasingly exposed to and fascinated with western lifestyles and values. From time to time there are campaigns to criticise 'bourgeois liberalism' and 'spiritual pollution' but the contradictions stemming from the stress on unity and stability on the one hand and encouraging economic productivity and vitality on the other were clearly evident throughout the eighties and nineties. But the 'crisis of faith' facing society at large and the periodic upsurges, both in the rural and urban areas have been responded to by a further tightening of control. The neo-liberal expectations that economic reforms over a period of time lead to political reforms and the emergence of a civil society, do not appear to be materialising.

"History", wrote Karl Marx, 'is nothing but the activity of men in pursuit of their ends.' Mao Zedong and Deng Xiaoping, who more than any other individual leaders shaped the policies and politics of their respective eras, were certainly pursuing the goal of making China a rich and powerful nation state. But they differed fundamentally in the means they adopted. The history of Mao's China and Deng's China is thus bound to be different. However, unlike the erstwhile Soviet Union, the Chinese have not sought to break off or disassociate with their Maoist past. The June 1981 Resolution neither denied Mao's contributions nor attempted to gloss over his mistakes. In Dengspeak, to assess Mao's achievements and errors impartially was "to seek truth from facts and to learn from past experiences" since Mao's achievements were "primary and his mistakes secondary". Having absorbed "the lessons of (Maoist) history" the CPC and China proceeded to launch market reforms. Since the 1970s, the stress has been on the economic achievement of the Deng period. Interestingly however, the official pronouncements and projections in the media regarding the PRC's 50th anniversary invariably emphasise the achievements and solid foundations laid over the last 50 years, without ever pacifying them. On the occasion of the 50th anniversary of the founding of the PRC, the general office of the central committee of the CPC and the general office of the state council released 50 slogans. They are a fascinating compilation of the nature, aims and objectives of a modernising nation-state. There are six slogans on socialist construction and development of productive forces, two on the socialist market economy and two on the socialist legal system; four on Deng Xiao Ping Theory, four on the party and two on the

army. There is one on political stability and unity and the bulk on the social, cultural and human values essential to making China a strong, modern, prosperous and united country. In this compendium, the slogan which calls on the people to rely on the working class wholeheartedly appears quite out of place amidst those which are a product of the distilled wisdom of the reform era. One has merely to recall the slogans of the Cultural Revolution to confirm that this is indeed a new China with a new agenda. The "third generation of Chinese leadership with Jiang

Zemin at its core", leads a China still in the "primary stage of socialism". In this stage, according to the new leaders China will have to continue maybe even for a hundred years. The legacy of the last 50 years of the PRC comprises two decades of revolutionary mass mobilisation; two decades of reforms, a 'lost decade' in between. Seemingly, there can be no turning back. But, as the Chinese continue to hurtle on the Dengist road of market reforms, sometime, somewhere, they will have to pause and figure out exactly where they are headed.

CHINA

Reforms and Health Care

Shyam Ashtekar

What has been the impact of reforms on Chinese health system and how is China responding to the situation?

AT about mid-century both China and India had rudimentary health care systems, with some hospitals in cities and only traditional systems for the vast rural hinterland. India started working on the Bhore committee report, which prescribed a rather top-heavy model, with big hospitals in townships and district cities and primary health centres for village clusters. China took a three-tiered model, with a vast foundation in the form of barefoot doctors (BD) in lakhs of villages. With BDs, China gave a concrete shape to its health intentions down to the grass roots level – curative, preventive or promotive.

India's Bhore committee report was weak in the village-level infrastructure and lay stress on shaping it like the British system. India's subsequent efforts, to mend the Bhore model, did not work for various reasons. For instance the Srivastav committee recommendation for community health workers was implemented in 1977 but the programme failed to take roots and died in the mid-1980s. This and other factors resulted in a wide gap between the health status of the two nations over the decades.

China fought it out without any external aid, technical or financial. The Chinese rulers worked on four principles. The basic principles came from the dire situation and the war-like circumstances throughout the troubled decades. These very principles became the cornerstones of the modern concept of primary health care.

They continue to be relevant for all nations with similar problems: priority for the problems of the masses; prevention first; making the most of traditional and local resources, combining these with modern medicines; and mobilisation of community for solving health problems. The principles are self-evident, except one that needs a rider. 'Prevention first' is a slogan in India too, but curative care was not neglected in China even at the village level.

China acted on these principles and there was the collective system, the communes, the work brigades and the production teams to ensure implementation of the policy. It worked well and put China's health on a strong foundation. With its 8-lakh villages armed with BDs, China moved on to build the next tiers of health care. This logical growth ensured the right use of resources and optimised service-utilisation at each tier. The institution of co-operative medical scheme strengthened the internal relations between the three tiers and also mobilised the community behind the gigantic effort.

Right through 1950s and 1960s, China established its health facilities at three levels: village, township and county. Here is the brief anatomy:

Level one: The village health station (formerly known as the brigade health station) with one or two BDs, a health aide, sometimes a nurse. This facility served the masses at the grass roots. Apart from treatment of common manageable ailments, BDs offered health education,

spearheaded preventive campaigns and administered co-operative medical scheme (CMS).

Level two: The township health centre (THC) (formerly known as the commune clinic) for a cluster of 15-20 villages, covering together about 40-50 thousand population. The THC has 30 beds and other facilities for curative and preventive services.

Level three: County, population about four to five lakhs, equivalent to about 2-3 talukas in India: At this level there are several facilities – a 400 bed general hospital, 30-100 bed MCH hospital, a 30-100 hospital for Chinese system of medicine, anti-epidemic station for preventive campaigns, secondary professional schools for BDs (now called rural doctors) and nurses, and some other facilities.

Above all this, there are provincial hospitals, generally attached to medical colleges like in India. In major cities there are ward-hospitals (called the district hospitals) for parts of the city. Special purpose hospitals like the infectious disease hospital also fall in this category.

Chinese leaders laid emphasis on native healing systems right from the beginning. At all levels of health care traditional healing methods and facilities have a prominent presence. Even the RD uses about 30 herbal medicines and 50 acupuncture points. In the early periods, TCM was the mainstay of treatment at brigade health stations and people were involved in collection of herbal medicines for their health facility (Health Care in China, China Health Care Study Group, Christian Medical Commission, Geneva 1974). In all hospitals TCM services are available under the same roof. In addition there are special TCM hospitals that also offer western medicine. Equity of pay scales, status and administrative powers between the western and TCM systems is complete something that ayurveda utterly misses in India. Since TCM has been given a lot of space, there is a discernible progress in the TCM sector even on the research front. This fact is supported by other experts. In Zaiding county near Shanghai I saw a 400-bed TCM hospital with a regular research wing. Most of the TCM hospitals have their own TCM pharmacies too. Medicinal raw material flows from the hinterland into these hospitals. It is a regular trade now.

The non-drug acupuncture system has a visible presence in all hospitals. For many illnesses people prefer acupuncture and massage therapies that give, in addition to therapeutic effects, some physical comfort and warmth to the suffering

people. In contrast with the cold, calculated and objective methods of western medicine, this physical system of healing is quite popular in China.

Clinical trials in TCM came later in China, but a virtual 'multicentric clinical trial' was conducted by people themselves over four decades. People made their own decisions about which treatment to take for which illness. To help them, major hospitals employ treatment guides in reception. In India, most western system doctors do not see eye to eye with ayurvedic doctors. Ayurveda's position in India looks too weak in comparison with that of TCM in China. This is a conscious political development, not a merely scientific decision.

Till 1978, the rural people had a co-operative medical system in 95 per cent of villages (CMS) in China, relying upon annual contributions from households. This not only met the expenses at the village health station, but also covered major part of expenses at the referral hospitals. The BDs, who looked after 70-80 per cent problems of the village people, were paid by the commune by way of work points. The contribution to CMS itself ranged from 1-2 yuan per annum which is Rs 8-16. It covered costs of both medicines and consultation at the VHS plus part of referral care. This made a wide safety net at all levels.

For other sections of the society – mainly the factory workers, there was and still is a reasonable cover of medical insurance, supported by the central government. Government servants enjoyed a free medical care, which continues till today. (Unpublished paper of Gu Xingyaun, Department of Health and Statistics, Shanghai Medical University, China) I was told that factory establishments are now grumbling about the rising insurance premia.

The CMS kept a rational check on the costs, ensured optimal utilisation of services, and provided equitable access to health care. The CMS also ensured people's participation in health initiatives and a decentralised mechanism for health finance and administration.

Before liberation private doctors trained in modern medicine were common in cities, while villages were dependent upon private TCM healers. This changed after liberation and both these sectors were absorbed in the new public sector. It was not possible to start private clinics and hospitals in China till 1978. This kept a lid on costs of medical care in some way. But a compulsion to absorb all doctors and paramedics in the health system did have its impact on costs.

AFTER REFORMS

After the disbanding of communes in 1978, the CMS simply collapsed. The government was unable to suddenly bear the expenses of such a huge programme in lakhs of villages. User fees were the natural option in this period of transition. Whatever money government had was pushed into infrastructure that helped market, leaving less money for health care than ever before (Zuo Xuejin, 'China's Fiscal Decentralisation and Financing of Local Services in Poor Townships', *IDS Bulletin*, Vol 28:1, 1997). Foodgrain subsidy continues.

The reform package involved a 'push to the market'. The communes were disbanded and farmland handed over to households. The household responsibility gave farmers freedom to cultivate, process and sell their produce, while the government provided infrastructure facilities. China began its economic reforms with the farm sector, taking other sectors in reform process later. This contrasts with India that began its reforms for non-farm sector, and even now the farm sector is heavily chained. The market reforms helped rural people in parts of China that had better infrastructure and market access. The second change involved freedom for entrepreneurs. Opening of internal markets and external trade was another major part of reforms. While talking to doctors and professors, I got an impression that reforms are a welcome thing in most sections and there are visible signs of reforms paying off. In eastern China, it was after 1978 that farmers built good houses for themselves. Malnutrition is still common (35 per cent children in two-five year group), but famine and starvation deaths are unheard of after 1978. Life is still a struggle for most farmers especially in the western, far northern and south China. Small farm size with little equipment drives the peasants, especially women into hard menial work. The class that was hitherto unaffected by reforms was the government employee but the new premier has announced his intention to 'free' half of the government employees. In words of Gu, public health expert of Shanghai Medical University, "reforms were inevitable and have done good to China but their adverse impact on CMS needs to be corrected."

The commune disappeared in 1978 and with it went many of its organs including CMS. The first thing that happened to the BD-VHS system at villages was switch over to user fees. This may have been too hard for the cash starved peasantry, but

it did hold together the VHS services through the turmoil. Since the fees at this level are relatively small, people somehow accommodated this additional cost. But it was a different story altogether at the hospitals, where fees are far more. Only two categories were protected – the government employee and the factory worker. The latter was supported through medical insurance contributed by the factory establishment. These two categories constitute about 25 per cent of the total users at hospitals, leaving 75 per cent users to pay for services. Payments for hospital services have been reasonably high (see Table for some rates) although cheaper by Indian private sector standards. It has been reported that the cost of average hospital admission amounts to 60 per cent of average annual household incomes of poor families. Several factors contribute to this high cost – oversized staffing pattern, rising costs of medical consumables, etc (Yu Hao, Cao Sihua and H Lucas, 'Equity in the Utilisation of Medical Services: A Survey in Poor Rural China', *IDS Bulletin*, vol 28:1, 1997).

User fees have hit the utilisation of hospital services in China. An official report states that about 29 to 48 per cent of patients referred to hospitals could not get in-patient treatment as they could not afford hospital fees (Gerald Bloom and Gu Xingyuan, 'Introduction to Health Sector Reform in China', *IDS Bulletin*, vol 28:1, 1997). User fees have sustained the health infrastructure in difficult times, when no system was there to support the village health services. As for village level services, the fees were still manageably small. As there was a kind of ceiling through years of usage of the system, controls on fees remained. But it was a different story with the hospital services.

After reforms, some doctors have started clinics, but a hospital run by private establishments is a rare thing even in 1998. With China's elaborate public health infrastructure, it is almost unattractive to start private hospitals. Yet, in a way, the whole hospital system in the public sector earns fees from consumers and has become a privately funded monopoly public sector. I learnt that corruption, in form of doctors asking money from patients, is common.

Barefoot doctor was the most significant feature of the Chinese health system. To begin with the village youth turned 'doctor for the village' received a training course of variable period (few weeks to few months). They started working and were given short training exposures from time to time. Traditional medicine came

in handy for lakhs of BDs spread in the vast country, which was a great logistical challenge for external drug supply. They earned some remuneration in addition to the farm work compensation. Many such BDs mingled with the general medical system in later times and in this sense their linkage with the developing health system was unique.

After reforms, the title BD was dropped in favour of rural doctor (RD). The old generation of BD is now nearly replaced with new RD and secondary professional schools are training a new generation of RDs. Many old BDs got their training later in these schools in each county. The new course is of three years' duration, which combines two years academics and one year of hospital training. Half of the 2,600-hour curriculum is allotted to clinical topics including TCM. The training now involves computers and this will help the elaborate data management of the Chinese health system.

The RD candidates are sent by villages, which bear some portion of the training costs of RDs. The main portion comes from the candidates. The money has to be refunded if the RD fails to join the duties at village health station. The entire course costs about 7,200 Y (over Rs 35,000) and living costs are extra. The course actually costs some more money (30,000 yuan) but these extra costs are borne by the government.

Final tests are conducted by the provincial government and nearly 10-30 per cent fail to pass. Another chance for passing is allowed, failing which the candidates mostly give up. After joining the VHS, the RD gets about 500 yuan per month through fees. They can get an entry to degree courses after five years of work and many such RDs are now working in hospitals.

Reports indicate that preventive health services have actually improved after reforms in the rich counties, but have been adversely affected in the poor counties, as less funds are available for the same in poor counties (Shu Baogang and Yao Jun, 'Preventive Health Care Services in Poor Areas of Rural China', *IDS Bulletin*, vol 28:1, 1997).

The share of government in overall national health expenditure has fallen from the pre-reform level of 28 per cent to current level of 14 per cent. So also has government's CMS share from 20 per cent to 2 per cent. The share of out of pocket medical expenses rose from 20 per cent to 42 per cent of national health expenditure. Rural health facilities now support three quarters of their expenditure from payments by patients.

Several scholars have expressed difficulties about the exact details of health economics in China, since after reforms each province has its own variable approach to health care finance. Local bodies in each city and village have their own tax revenue to pay for local development services. About 90 per cent of recurring expenses on health services come from local bodies. Villages collect a tax from its residents. The tax revenue varies according to the income level in each village and area. The local bodies in south-east China region get far more from tax revenue than say the north Chinese villages. So the spending on health too changes drastically according to the prosperity of the area. This has left poor villages without much funds to spend on health services while the rich areas have not only survived the user fees era but have entered new phase of insurance systems in health care. After reforms the central government revenues have fallen to 50 per cent and more is retained by provinces, cities and prefectures. So central grants for social sector have declined.

The most important challenge in Chinese health services after reforms is the rising proportion of 'unmet needs' – people going back from hospitals without treatment due to steep costs of hospital services. Chinese policy-makers are exploring ways for making health care economical and re-establish insurance systems for all people.

The cost factor is hard to control because of cost of medical technology, consumables, and the heavy staffing pattern. In Chinese policy circles there is little support for free care as the state is increasingly unable to bear costs of such a widespread health care network. It is difficult to get away from the user-paid-finance. So the only option is to establish insurance mechanisms. Experts have suggested a

TABLE: RATES OF COMMON SERVICES IN CHINA AND IN A MIDDLE LEVEL CITY IN MAHARASHTRA (NASIK 1997)

Service	China: Yuan Converted in Rs (Public Health Institutions)	Nasik (India) in Private Sector (Rs)
OPD consultation	50-100	50-100(12)
Sonography	80	300
Childbirth	4,000	1,000
Appendectomy	4,750	10,000
Childbirth: I (Institutional),	1,000(1), 350-	1,000(1)
H (Home, attended)	400(H)	
Cesarean section	7,500	10,000
Bed charges	110	200-300
1 Yuan is about 4.75 Indian Rs		

mix of pre-payment and co-payment system with a 60:40 formula. The household pays the required pre-payment annually to the county insurance scheme. This ensures the user access to all levels of health care village to county – at reasonable costs. Some co-payment has to be made at the time of contact with health system.

In the coastal counties where villagers are better-off than northern and eastern China villages, such a system is slowly taking roots. I saw one such county near Shanghai. But in the better part of rural China this stage is a far away dream. The expert I met in Shanghai told me that this is very difficult even if the Chinese government passes a resolution making health insurance a compulsory task of the local governments down the county level. Such a legislation is on the cards. There are a number of difficulties why this is less likely to happen. One reason is the increasing costs of health care, another being inability to pay the pre-payment costs on the part of farmers in poorer regions.

Since the CMS system is broken, people are increasingly bypassing village health facilities in favour of higher centres of care. The answer is to modernise the village health care services and bring back insurance systems. The new RD course is already a modernised version of the old BD version. Health establishments are increasingly resorting to 'medical malpractice' as they look for more funds for paying the staff. I saw that even RDs are indulging in 'injection-saline practice' like the rural Indian private doctor. I saw similar scenes in township hospitals. This is recognised as a public health challenge and again the answer lies in a mix of pre-payment plus co-payment mechanisms.

China is still grappling with three major public health problems – smoking, child malnutrition and illnesses of aging. The first two date back to pre-reform days. The last, aging is a consequence of longevity. Now we know that famines killed millions of Chinese before the reform era. I did not hear any health policy expert blaming reforms on any of these counts.

China has undoubtedly a very elaborate health care network thanks mainly to the million plus rural doctors (former BDs). We have seriously erred on this front. We still have sometime to correct this problem before the vacuum is filled with untrained quacks. Even the states that are flush with World Bank soft loans have done little on this front. It is an urgent national task to train lakhs of men and women as health providers for lakhs of villages.

The large private medicare sector in India is a result of poor development of

public health sector. We cannot correct this situation at this moment. What we need and can do is devise ways to control costs and improve overall quality of this sector. One way is to foster a third sector between the government and private, which has the coverage qualities of private operators with accountability factors of government sector, keeping a low cost for the bulk of health care needs. Insurance is unlikely to happen in the countryside for sometime for various factors, including continued pauperisation of India's agricultural economy.

On the technology front, China's excellent approach to integration of traditional knowledge and resources should be an eye-opener to the India's 'ruling' medical community. Frankly, they did not wait for laboratory reports and clinical trials to prove or disprove a traditionally established medication. They simply made available all the services everywhere under the same roof. People did the job of separating wheat and chaff.

The concept of home beds extension services in China is a marvelous idea and I do not think it is impossible to follow for our private and public hospitals. It keeps costs down, increases employment of paramedics, ensures patient comfort and compliance and keeps the health system tuned to the realities of common people.

The widespread use of computers with Chinese software has modernised the information system in China's health system. This is a far cry even in our modern urban hospitals, leave alone public health institutions.

User fees in public health system is an abhorred subject in India, but Chinese experts were surprised about free health care in Indian public hospitals. Community finance demands a lot of quality and commitment from providers. There is more to user fees than just the 'state-disowning of health care'. It is worthwhile introducing a system of pre- and co-payments in health care. This will make rapid expansion of facilities possible without bloating health care costs. Needless to say that people below poverty line must receive a subsidised/free referral care and the costs borne by state governments. Free care across the board however creates more problems than it solves.

Decentralisation of health care with effective role for village level bodies was a major factor in the spread of health care network. India has not attempted this beyond the level of state government and municipal corporations. The zilla parishads have only been subservient to the top down health administration. Village bodies have no role in health care in India. This has stalled progress.

China has paid serious attention to the non-medical health inputs like water safety, sanitation and primary education. This has paid off rich dividends. That infections have declined is proof enough of this fact. India has a long distance to go on these fronts. Finally, let us not link China's health progress to their regimented political system; it is because they thought of 'villages first', rather than our blundering 'cities first' centralised approach.

Rise of Smaller Parties

SG

The emergence of some small, single caste political parties in eastern Uttar Pradesh is indicative of the failure of the larger parties to effectively represent or bond with certain social interest groups which are no longer prepared to be the vote banks of these larger parties.

THE post-Mandal landscape in Uttar Pradesh has witnessed an unprecedented churning: If the implementation of the Mandal report in 1990 by VP Singh's National Front government was intended to 'co-opt' the upper backward castes who now wanted social acceptability - in the shape of government jobs - to match their growing political and economic clout, the political parties, too, did not lag behind in 'social engineering' - in accommodating more OBCs and, indeed, dalits.

The decline of the Congress in this period saw the Muslims and dalits moving to the Janata Dal, which was also the main beneficiary of OBC gratitude, as the party which had implemented the recommendations of the Mandal report. The Bharatiya Janata Party - though inherently and instinctively opposed to the idea - began to mobilise the OBCs as well. The BJP's task became easier when the Janata Dal split and the Samajwadi Party emerged: The latter began to be identified not with the OBCs as a whole in the way the Janata Dal had been, but with the Yadavs in particular. And so the BJP was able with less effort to attract not just other powerful OBC communities, such as the Kurmis and the Lodh Rajputs, who were rivals of the Yadavs, but also sections of the MBC's as well.

It is against this background of competitive mobilisation that the emergence of some small, single caste parties in eastern Uttar Pradesh needs to be looked at. For their appearance is indicative of the failure of the leadership of the larger parties to effectively represent or bond with certain social interest groups. It also means a depletion in the social coalitions these larger parties are trying to form and stabilise. Take the case of two registered but unrecognised parties, which operate mainly in the eastern part of the state - the Apna Dal and the Pragatisheel Manav Samaj Party. While the Apna Dal, led by Sonelal Patel, is a party of the OBC community of kurmis, the PMSP represents the MBC community of birds.

The Apna Dal, which was formed in the early 90s, has been steadily increasing its vote share over the last two general elections. For instance, in Macchhishahr, its vote share rose from 2.46 per cent in 1996 to 5.53 per cent in 1998; in Jaunpur,

from 4.67 per cent in 1996 to 6.17 per cent in 1998; in Varanasi, from 4.76 per cent in 1996 to 10.16 per cent in 1998; in Robertsganj from 1.77 per cent in 1996 to 5.83 per cent in 1998; and in Phulpur, from 0.44 per cent in 1996 to 6.27 per cent in 1998.

Equally significant, in these five Lok Sabha constituencies, the Apna Dal was just behind the three major parties in the state, the BJP, the SP and the BSP, but was ahead of the Congress which it had pushed to the fifth place - in Macchhishahr, the Congress stood sixth, with the Janata Dal placed fifth. The Apna Dal picked up votes in 1998 in another 37 Lok Sabha constituencies across the state: Of these, it was ahead of the Congress in Ghatampur, Banda, Allahabad, Mirzapur, Faizabad and Akharpur.

In this current round of elections, the Apna Dal was visible once again. A senior civil servant in Varanasi stressed that with elections in eastern Uttar Pradesh being fought largely on "caste and communal lines", the Apna Dal would definitely "poll again". In fact, in Phulpur, its candidate, party president Sonelal Patel, was making a strong enough showing for locals to consider him to be in the reckoning. Huge hoardings of Mr Patel, stretched out, his foot in a cast - the result of a fight which had landed him behind bars - had excited enough sympathy for the local Momin Conference to publicly announce its support to him.

At the busy Sason bazaar in Phulpur, a group of dalits - mainly pasis - while declaring their own unswerving commitment to the elephant, i.e. the BSP, predicted that the Apna Dal would get a substantial chunk of the kurmi votes here. They pointed out that Phulpur's sitting MP, Jang Bahadur Patel, who had been denied a ticket by his party, the SP, was campaigning actively for Sonelal Patel.

In the Birqazi kasha of the same constituency, Faiyaz Ahnied, a young doctor, said there was an "ajib sa mahaul" (strange atmosphere): His contention was that the SP was being challenged not just by the BJP and the BSP, but also by the Apna Dal, as changing the SP candidate had ruffled some feathers. He also maintained that the Muslims were going to be divided between the SP, BSP and

the Apna Dal - the Congress candidate, Ram Poojan Patel, who has represented Phulpur in the past was considered unreliable because he was a 'dalbadlu' (one who has changed parties too many times). Clearly even a small single caste party such as the Apna Dal can attract some votes of other communities such as the Muslims - whose main objective is to defeat the BJP - if it can demonstrate that it is making a strong bid for a seat.

So why are substantial numbers of kurmis voting for the Apna Dal rather than a mainstream - or at least a larger - party, given that at present virtually all its candidates have no chance of making it to the thirteenth Lok Sabha? In the kasha of Puropurnahar in the Macchhishahr constituency, a group of locals standing outside a kirana shop, hotly discussed the relative merits and demerits of the various candidates.

Suddenly, one man declared, "I don't know about the others here, but I am going to vote for the Apna Dal". To this correspondent's query as to whether he was a kurmi, he replied in the affirmative. But before Radhey Shyam Patel (for that was his name) could answer another question - why was he wasting his vote on a candidate who clearly would not win - another man in the crowd shot back: "Jaatiswad (casteism)".

Red-faced, Radhey Shyam Patel took him on: "When you Brahmins (Patel's expositor turned out to be a CP Mishra) vote for the BJP, that's not casteism. But if I vote for the Apna Dal, that's casteism. Everyone has a party these days, the upper castes have the BJP, the Yadavs the SP and the Dalits the BSP. So we kurmis have the Apna Dal." But when Patel's anger had dissipated after others in the crowd had pacified him, he added that he knew that as a single caste party, the Apna Dal's avenues of growth were limited unless it attracted a few other left-out castes as well. "Then the Muslims, too, may consider voting for the Apna Dal", concluded Patel, pointing to Phulpur.

Similar sentiments were expressed by the proponents of the even smaller and more recently formed PMSP, which currently has a presence in about seven Lok Sabha constituencies in Uttar Pradesh - Mirzapur, Phulpur, Chail, Robertsganj, Varanasi, Jaunpur and Macchhishahr.

In the village of Barki Khajri which falls in the Varanasi Lok Sabha constituency, the binds, who make up half the 2200-strong village, said that they had made up their minds to vote for the PMSP even though they had been divided between the BJP and SP in the elections in 1998. Explaining the decision, Shivpujan Bind said, "We want to assert our rights as binds. No one knows we exist at all. If you don't make yourself heard, no one

bothers about you. We want others to know that they can't do without us."

The desire to be heard is also born of despair. For here in Barki Khajri, where a majority of the binds are weavers of the silk saris that Varanasi is justly famous for or of the carpets that have made the exporters of the adjoining Mirzapur-Bhadohi belt into millionaires, conditions are dire. "The trade is in bad shape", said Hari Ram Bind, "and so we make only Rs 25 a day – on a good day, it might be Rs 50. It is our compulsion that makes us accept such poor payments. We don't have the capital to buy our own yarn nor do we have the marketing skills to sell what we make: So we are totally dependant on the traders and exporters." He added that the nearest school was quite a distance from the village and, even then, it was on the rare day that the teachers put in an appearance, for most of them were busy farming their land. Given this scenario, Hari Ram Bind said the vote was their only means of protest, "Nahin to hamari sunwai nahin hogi (no one will hear us otherwise)".

The role models for formations such as the Apna Dal or the PMSP are the SP and, more particularly, the BSP. The strong presence of the SP has clearly provided the yadavs – already an upwardly mobile community – with even more political, economic and social clout. BSP general

secretary Mayawati's two brief tenures as chief minister of Uttar Pradesh were sufficient to demonstrate to the Dalits the value of having their own representative in power.

In Bheran Khatai in the Varanasi constituency, the chamars assert they will vote for the BSP because during her stint as chief minister, Mayawati got this village declared an Ambedkarnagar, thus ensuring that a pucca road was built to the village and houses constructed there under the Indira Aawas Yojana. In Dharsauna village, P K Chowdhury, a chamar declared, "If we send our man to parliament, whether he becomes the PM or sits in the opposition, he can speak up for us. But if we don't get a seat there, how will we be heard?"

It is evident then that such assertions spell a depletion of votes for larger parties such as the BJP and in some cases, the SP. The kurmis, for instance, were considered to be largely supporters of the BJP, but the party has no kurmi leader who inspires confidence in the community. The former Bajrang Dal president, Vinay Katiyar, may be a kurmi but his influence is restricted to Faizabad which he has represented in the past, but his criminal record has not washed well elsewhere. Nor has the presence of Beni Prasad Verma – a kurmi leader who was union communications minister in the United Front

government – in the SP helped that party with this community. As Rudhey Shyam Patel in Puropurnahar in Macchlishahr put it: "Beni Prasadji to Mulayam Singh ke pithu hain (Beni Prasad is merely Mulayam Singh Yadav's sidekick)."

Single caste parties such as the Apna Dal and the PMSP then provide their supporters with a channel of self-assertion, a way of ensuring that castes – which are either numerically small or lower down the social ladder – are not swamped by the dominant social groups. And with the failure of the state to address the common man's agenda – education, employment, health facilities, housing, even safe drinking water – a growing number of social interest groups are beginning to feel that unless they have a share in power and decision-making, they will be no closer to getting the basics or improving the quality of their lives.

So if mainstream parties such as the BJP or the SP don't allow them the means of such self-expression, then they have to create avenues in the way the BSP did – a party which today commands almost 21 per cent of the vote share in Uttar Pradesh. They are no longer prepared to be vote banks of the dominant castes, because that route has proved unfruitful. Political power, they feel, must precede social and economic amelioration.

Orientation Course in South Asian Peace Studies

The Peace Studies Programme at South Asia Forum for Human Rights (SAFHR) is offering a fifteen-day orientation course in Kathmandu, Nepal, from 7-21 February 2000. The course is intended for peace and human rights activists, media persons, researchers and academics in peace studies and diplomats involved in policy making in conflict resolution. The course will include examination of themes such as peace as value in South Asian cultures, traditions of conflict resolution, peace accords in the region, civil society in peace process in South Asia, refugee and minority rights, sharing and common management of scarce resources, bilateralism and regionalism as the way to conflict resolution, economics of war and peace, women in peace, media as a catalyst of conflict and peace and evolutions in the notion of rights and peace.

Participants will have to support their own travel. Registration fee for South Asian participants is US \$ 100 (or its equivalent in Nepali rupee) and participants from outside the region US \$ 250 (or its equivalent in Nepali rupee). Board, lodging and other expenses for the selected candidates will be provided by SAFHR. Travel grant is available for limited number of candidates for which they will have to apply separately. The preferable age limit for participation is 35 years. Women, members of minority communities and refugees are particularly encouraged to apply.

Applications must reach Peace Studies Desk in the South Asia Forum for Human Rights (GPO Box 12855, Fax 977-1-527852, E-mail south@safhr.wlink.com.np) by November 15, 1999. Applications by fax or e-mail will be valid. Applications will have to be supported by full particulars, 500-word summary of the relevance of the course to the work of the participant, and names of two referees whose recommendations should reach independently SAFHR peace studies desk by November 15, 1999. The application must include all necessary details such as language skill, experience and nature of current work. The summary has to include the candidate's own idea of peace and human rights activism, and the relation of the applicant's work with SAFHR's peace studies programme. In selection of candidates the 500-word summary will be accorded importance.

The course will be participatory, and will involve intense course and field work. Frontline activists and researchers will be sharing their knowledge and experience with the participants who will leave the course with a critical understanding on issues of peace in South Asia.

Micronutrients and Child Health

Vitamin A Initiative in Orissa

Meena Gupta

Vitamin A deficiency has only recently been acknowledged as a major public health problem in India. Orissa has initiated a new programme that will ensure that young children are adequately protected from the consequences of the vitamin deficiency.

THE role of Vitamin A in preventing blindness is well-documented. However, there is growing evidence of its role in providing protection against other infections, especially measles, diarrhoea and pneumonia, and in controlling mortality during pregnancy and infancy. Improved Vitamin A status reduces the duration, severity and complications associated with measles and diarrhoea.

Vitamin A deficiency (VAD) is widespread in young children in many developing countries, and it substantially increases a young child's risk of death. A meta-analysis of a series of controlled trials indicates that routine Vitamin A supplements given between 6 and 72 months can be expected to reduce mortality by 23 per cent wherever VAD exists. Additionally, Vitamin A supplementation as part of measles case management can reduce the case fatality rate by more than 50 per cent [WHO and UNICEF 1998]. Vitamin A supplements given to a mother immediately after birth will improve mothers' Vitamin A status, as well as the Vitamin A content of their breast milk, and is likely to contribute to the improved health of both mothers and infants.

Clinically VAD manifests as ocular signs, including night blindness, and these are associated with advanced stages of the deficiency condition. These are rare compared to the vast problem of subclinical deficiency, which is difficult to measure in a field situation. India is one of the countries where Vitamin A deficiency is widely prevalent. At the national level, it is reported that the prevalence of VAD based on clinical evidence (Bitot's spots) in children up to 5 years varies from 0.3 per cent to 3.6 per cent [Department of Women and Child Development, Government of India, 1995].

In India VAD is a public health problem, and/or high under-five mortality exists. The present coverage with Vitamin A supplements is inadequate [UNICEF 1999]. In Orissa, one of the poorer states in the country, VAD is likely to be much

more widely prevalent. According to the National Nutrition Monitoring Bureau (NNMB) report (1981-91), the average daily intake of Vitamin A in the general population in Orissa is only 70 per cent of the recommended daily intake.

National Immunisation Days offer an excellent opportunity to provide a single high dose of Vitamin A to all children aged 6-60 months and 34 countries (including Bangladesh) have so far begun to do so [UNICEF 1998]. However, this policy has not yet been adopted in India. The National Prophylaxis Programme for Prevention of Blindness due to VAD implemented throughout India aims at protecting children between 6-60 months, who constitute the most vulnerable segment of the population. The long-term strategy of the programme focuses on dietary improvement by promoting consumption of inexpensive sources of Vitamin A. Dietary improvement is a slow process which can be possible only over a period of time. Considering the importance of Vitamin A in controlling childhood morbidity and mortality, it is imperative that education for behavioural change should continue alongside supplementation with Vitamin A [MoHFW 1991]. The short-term strategy focuses on a single massive dose of Vitamin A given at six-monthly intervals to children between the ages of six months and five years. Since the prevalence of deficiency is highest

among children below three years, priority is given to children in the age group of 6 months to 3 years. The contact with the infant during measles vaccination between the ages of 9 to 12 months is considered to be a suitable time for administering the first dose of Vitamin A. The time of the booster dose of DPT/OPV at 18 months of age is used for administering the second dose of Vitamin A. Subsequent doses are given at six-monthly intervals up to the age of three years. The administration of Vitamin A in India is done both through the health system (multi-purpose health workers) and where the ICDS programme is functioning, through the anganwadi workers.

The WHO/UNICEF/IVACG Task Force (1997) plan for administering Vitamin A as a preventive and therapeutic intervention and the government of India policy which also indicates a similar plan, but does not include administration of Vitamin A to pregnant and lactating mothers, are outlined in Table 1.

SITUATION IN ORISSA

Though precise data are not available, VAD in Orissa is likely to be high. The administration of Vitamin A through the National Prophylaxis Programme for Prevention of Blindness due to VAD has not been very successful. The Multi-Indicator Cluster Survey (MICS), 1998, reveals that only 56 per cent of children in Orissa received the first dose of Vitamin A when they had the measles vaccination. This, though marginally higher than the reported coverage in 1996 (51 per cent), is far from satisfactory. The main bottlenecks in the successful implementation of the National Prophylaxis Programme for Prevention of Blindness due to Vitamin A are many.

Irregular and inadequate supply of Vitamin A: Currently the only supply to the state is through the drug kits supplied by the government of India to the health sub-centres. These kits are normally sup-

TABLE 1: VITAMIN A INTERVENTION: POLICIES AND PROGRAMMES

Document	Dosage	Duration/Interval	Dosage form
<i>Population Group: Women of reproductive age group with night blindness or Bitot's spots</i>			
WHO/UNICEF/IVACG			
Report	10,000 IU daily	At least 4 weeks	10,000 IU Tabs / solution
GOI Policy	No policy	No policy	No policy
<i>Population Group: Infants 6-12 months of age</i>			
WHO/UNICEF/IVACG			
Report	100,000 IU	Once in 4-6 mths	Capsule/solution 100,000 IU/ml
GOI policy	100,000 IU	Once in 6 months	1 ml solution of 100,000 IU.
<i>Population Group: Children over 12 months of age</i>			
WHO/UNICEF/IVACG	200,000 IU	Once in 4-6 mths	Cap/solution of 100,000 IU
GOI policy	200,000 IU	Once in 6 months	2 ml solution (each with 100,000 IU)

and supplies of Vitamin A, grossly inadequate for the five doses that each child is supposed to receive between the ages of 9 months and three years. Often only the first dose is administered.

Vacant posts of paramedical staff: Paramedical posts in remote areas often remain unfilled.

Physical inaccessibility: Health facilities in many tribal areas are not accessible because of poor communication facilities.

Ineffective utilisation of available supplies: The entire bottle of 100 ml of Vitamin A often cannot be used within 6-8 weeks of opening the bottle, resulting in loss of potency of the remaining solution.

In August 1998, the Kandhamal district of Orissa was the first to try out an alternative strategy to administer Vitamin A to under 5 children. The district decided to hold a campaign to administer the vitamin on a single day to all children between the ages of 12 and 60 months, and to continue such administration at six-monthly intervals. The shortfall in supplies was bridged by UNICEF. Good coverage (96.5 per cent of eligible children) was obtained, and the available stocks of Vitamin A solution could be used effectively as all children were dosed on the same day.

Encouraged by this, the department of Health and Family Welfare decided to undertake a statewide campaign for improved coverage of Vitamin A for the age group 9-36 months. The overall objective is to achieve, over a period of two to three years virtual elimination of VAD in children in the 9-36 month age group by administering Vitamin A supplement through the following approach: Vitamin A administration along with routine immunisation for measles (A Catch-up Measles Campaign contact for nine-month old infants) is planned; one stand alone Vitamin A single-day administration campaign for children 12-36 months annually; a second single day Vitamin A administration campaign after six months piggy-backed whenever possible on one dose of pulse polio immunisation.

The government of Orissa expects to achieve the following results through this approach: (a) coverage of 90 per cent of children 12-36 months with five doses of Vitamin A supplementation by the year 2001; (b) Elimination of all clinical signs of VAD among children below 5 years of age by 2001; (c) consumption of Vitamin A rich foods on a regular basis by at least 80 per cent of children below 5 years as well as pregnant and lactating women.

The impact of the campaign will be measured by analysing morbidity and

mortality data in designated sentinel centres. The first such evaluation is planned for November this year. Secondary data will be analysed to see whether there is any change in mortality and morbidity among under-fives, especially related to measles and diarrhoea apart from blindness.

Some technical issues had to be considered before the campaign could be finalised. These were:

Toxicity of Vitamin A: Toxicity resulting from excessive ingestion of Vitamin A is a minor concern compared to the devastating effects of VAD. For children aged 1-6 years, it is reported that prophylactic doses of 6,000-10,000 IU given each day over a period of months pose a negligible risk of toxicity. A single oral dose of 2,00,000 IU poses no significant risk for children over the age of six months, and in adults, a single dose of 4,00,000 IU in one day is generally well tolerated. Children over 6 months can receive two high doses (2,00,000 IU) separated by at least one month with virtually no risk [UNICEF et al 1997].

Sero-conversion: Data concerning sero-conversions of measles and polio vaccines when given simultaneously with Vitamin A indicate no significant reduction in sero-conversion rates. Vitamin A supplementation of 1,00,000 IU, given concurrently with measles in India at the age of 9 months was found to significantly increase the sero-conversion rate. In Bangladesh, concurrent Vitamin A supplementation with each of the three doses of OPV had no significant effect on sero-conversion.

STRATEGY FOR SUPPLEMENTING VITAMIN A IN YOUNG CHILDREN

Administration of Vitamin A to infants 9-12 months of age will continue along with measles immunisation, as part of the routine immunisation programme. However, at present, nearly 44 per cent of children in Orissa do not receive the first dose of Vitamin A. As the first dose of Vitamin A is generally given with the measles vaccine and the measles immunisation coverage of 65 per cent [MICS

1998], to achieve 100 per cent coverage of children below one year, the present measles immunisation coverage needs to be increased from 65 per cent to 100 per cent. This will require strengthening of the normal immunisation programme, and a subsequent round to catch the infants left out.

The earlier practice of administering Vitamin A to children between the ages of 1 and 3 years, individually at different times and repeating it at six-monthly intervals throughout the year has been discontinued in the state. These children will now receive their supplements during the campaign on a single fixed day, every six months. As the first campaign was planned for March 1999, routine Vitamin A supplementation for children over one year of age was discontinued from January 1999 to eliminate the risk of toxicity. Though an interval of four weeks between the administration of massive doses of Vitamin A virtually eliminates this risk, the state took the precaution to stop administration eight weeks prior to the campaign.

The first statewide campaign began on March 7. All children aged 12-36 months were covered on in the first round of the Pulse Vitamin A campaign. The vast network of nearly 27,000 anganwadi centres was used to administer Vitamin A. Where the ICDS programme is not in place, the ANMs were primarily responsible for administration, along with NGOs and other local bodies.

The stock of Vitamin A in each district was estimated, and the shortfall supplemented by UNICEF. Vitamin A was procured in bottles of 50 ml, to make distribution easier to smaller AWCs and sub-centres where the number of children is small. The stocks of Vitamin A were distributed during the routine monthly meeting of the workers of the health and the ICDS systems, and hence no additional funds were required for transport of the vitamin supplement. As maintenance of cold chain was not involved, the logistics of distribution were more easily handled.

TABLE 2: NUMBER OF CHILDREN TO BE COVERED IN EACH ROUND

Vitamin A dose	Age Group	Estimated Number of Children	Estimated Requirement of Vitamin A (Bottles of 50 ml)
1st dose (March 99)	12-36 mths	18,10,500	72,420 bottles
2nd dose (Oct 99)	12-42 mths	22,63,125	90,525 bottles
3rd dose (Mar 00)	12-48 mths	25,92,000	1,03,680 bottles
4th dose (Sep 00)	12-54 mths	30,24,000	1,20,960 bottles
5th dose (Mar 01)	12-60 mths	33,05,000	1,32,200 bottles
Subsequent doses (Sep 01 onwards)	12-36 mths	18,10,500?	72,420 bottles

Note: Calculated on basis of projected population 0-4 years.

As administration of the pulse dose was restricted to children over one, all children received 2 ml (equivalent to 2,00,000 IU of Vitamin A) of the solution. However, workers were instructed to administer 1 ml if a child 9-12 months who had not received Vitamin A with measles immunisation was brought to the booth. The second round of the Pulse Vitamin A campaign is planned for October 1999 together with the first round of Pulse Polio. As the target group for Vitamin A is also covered under the Pulse Polio programme, and civil society and frontline functionaries have been mobilised for administration of polio drops, linking Vitamin A with PPI will reduce mobility and social mobilisation costs considerably.

Though the health and family welfare department is the nodal department for the campaign, to achieve the mammoth task of reaching an estimated 18 lakh children between the ages of 12 and 36 months across the state, the campaign was organised in partnership with the department of women and child development. This will be repeated in all the future campaigns. Responsibilities were spelt out at state, district and block level for all the staff. Training was built into the routine monthly meetings at the sector and block levels.

To ensure good coverage during the campaign, advocacy, communication and social mobilisation activities were taken utilising mass and folk media prior to the campaign. The focus was essentially to position Vitamin A administration as an intervention for reducing morbidity and mortality instead of its focus only on prevention of blindness.

The monitoring strategy decided upon is similar to the one used for PPI, using both the routine service delivery system and an independent coverage evaluation survey (which is planned for 2000). Monitoring was at the booth, the sector, block, district and the state level. State level observers supervised the campaign in the districts, and district level observers were appointed at the block level. Likewise, block level officials were to supervise the campaign in a cluster of panchayats or wards. District collectors were also actively involved in planning, supervision and monitoring the campaign at the district level.

Each child between the age group 12-36 months has been enrolled in the campaign in March to be followed up till s/he receives five doses of Vitamin A before graduating out of the campaign. This would mean an increase in children for the next five subsequent rounds, to include the successive cohorts of 12-17-month old

children. This also implies that the few children who miss the first dose at the time of measles vaccination will receive the first dose of Vitamin A only at the age of 12-17 months. The state is attempting an alternative model for administration of Vitamin A solution to children in the age group of 9 to 36 months to enhance coverage and thereby help reduce ailments such as diarrhoea, acute respiratory infections and blindness among children. The programme adopted by the state government will cover all children below 12 months who will receive the first dose at the time of measles immunisation; no Vitamin A supplementation will be given with measles immunisation to children above the age of 12 months; for children above 12 months the routine administration of Vitamin A supplementation will be discontinued; all children between the ages of 12 and 36 months will be covered through a single day campaign held at six-monthly intervals with any remaining children to be covered in the next couple of days; in all, 5 doses, each of 2 ml, of Vitamin A solution will be administered to a child over a period of two and a half years, excluding the first dose to be given at the time of measles vaccine; one round of the campaign will be linked every year to one round of Pulse Polio Immunisation; one standalone campaign will be held every year; routine therapeutic approach for treatment of children with clinical signs will be done through medical institutions. UNICEF is willing to support supply of Vitamin A for the first two years to cover the shortfall in supply. The government will mobilise resources for supplies after this period.

In September 2001 the numbers will reduce and remain stable thereafter as the number of children entering the campaign for the first time will be more or less equal to the number of children graduating out of the campaign with five doses.

Of a total number of 19,09,204 children enumerated in the 12-36-month age group, 18,15,355 were administered Vitamin A during the first round in March. This con-

stituted about 95 per cent of the children in that age group, as compared with 7.2 per cent coverage during routine administration of Vitamin A to this age-group in the past. No cases of adverse reactions to administration of the vitamin were reported. IEC activities clearly need strengthening - many parents referred to this as another 'polio' dose given with a spoon instead of with a dropper. For the second round, IEC activities are proposed to be started well in advance. Since the second round will be along with PPI in October, the costs of organising the campaign will be considerably reduced.

The cost of administering two doses of Vitamin A per child per year is estimated at USD 0.08 - i.e., Rs 3.40. This includes the cost of the vitamin, as well as the transport cost to the site of administration. The major cost is for supply of Vitamin A, which the state will be able to meet from the central government supply or from its own resources within two years' time.

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the *EPW* from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

MANAGER

Media and Kargil

Information Blitz with Dummy Missiles

Geeta Seshu

For the Indian media, Kargil was big news. Pages of print were devoted to stories about the conflict, the personalities, the government's role, national security issues and of course Pakistan's actions. What was the subtext of all this verbiage? Are we really as well-informed about the conflict as the media blitz would imply?

KARGIL caught the Indian media un-awares, as it supposedly did the government and the army. Covering the war from the battle-lines was easier said than done, for the army clamped down on direct coverage barely a few days after the air-strikes were launched on May 8. As a result, the media did the next best thing: it manufactured stories. Stories, euphemism in journalistic parlance for reports/features/analysis, were written up on every aspect of the conflict, often going far beyond government briefings and reports of the army handouts to bring us second and third-hand accounts of various actions in the battle. The media blitz included reports covering a plethora of possible angles of the conflict. We had human interest profiles of families of martyrs and the plight of villagers in border areas, poignant reports of letters from home and STD calls home and little spot stories on tailors stitching shrouds for the dead soldiers, the food we feed our soldiers, corporate responses to Kargil and views of celebrities on the conflict. Obviously, Kargil was major news and every newspaper and television channel wasted little time to get onto the story of the day. But what was the sub-text of all this verbiage? And importantly, what was left unsaid?

We looked at three leading national English dailies: *The Times of India* (TOI), the *Indian Express* (IE) and the *Asian Age* (AA) between May 9 and July 31. Our analysis covered news-reports, features, editorials and editorial page articles.

For over two and a half months, war-games occupied television viewers and readers of newspapers and magazines. The hindutva right spoke openly about 'finishing off Pakistan, the enemy' and of 'a strong and mighty India'. The VHP proclaimed in a meeting at Hardwar that '1999 was the year to wipe Pakistan off the globe' (AA, June 27). At the height of the crisis, the RSS organ *Panchjanya*

exhorted Vajpayee to rise and fulfil the role destiny has chalked out for him, rhetorically asking 'after all, why have we made the bomb'.

No doubt, the newspapers covered by this study, while publicising these statements and others by Advani ('Pakistan is a rogue state'), Kushahhau Thakre ('Kargil conflict is nothing short of war', IE, June 16), did condemn these statements, but these were mere formalities. The TOI, in an edit (June 23), cautioned against the nuclear option, not because such a course of action was disastrous but merely to counsel the government to adhere to a 'no first strike' commitment.

BEHIND THE WAR VERBIAGE

What did we get to read/see about the actual action? Initially, very little. The World Cup cricket was on, and while journalists covered the army briefing on Kargil, much more space and air-time was given for cricket coverage. Sponsored supplements filled newspapers while television news gave more importance to battles on the cricket ground.

Cricket and Kargil did meet when India played Pakistan: newspaper headlines were apprehensive of the 'hattle' ahead, emphasising security arrangements. *Indian Express* (June 8) had a curtain-raiser entitled "India, Pakistan to 'fight' it out today". The report itself outlined the high excitement over the match stating that it was a sad fact but true that, for many of the spectators and journalists, the Indo-Pak cricket match 'seems the next best thing to a war'. Naturally, when India did beat Pakistan, headlines gloated. The *Asian Age* (June 9) distastefully proclaimed, 'Reborn India kill Pak'.

Till this day, the press is divided about the nature of the army action in Kargil. Even the semantics of the army action is confused. Was it a war, a battle or a conflict? (a skirmish it was not, not with 410 bodies

returning home). Were 'they' infiltrators, mujahideen intruders, Pak-backed intruders, the enemy? In the absence of any clear idea, it was safer for the press to use all of the above, in the same copy, at different times, throughout its coverage. Some newspapers were in no doubt that a war was on. The *Asian Age*, for example, gave us headlines like, 'The 4th India-Pakistan war has started' (AA, June 24) or 'Nawaz tries bomb blackmail' (AA, June 25) and finally, when a truce of sorts was called and Pakistani troops began to pull out, the same newspaper said, 'Pakistan quits India' (July 12).

The *Indian Express* was not far behind. 'From war to Wimbledon, its India's day all the way', the paper said on July 5, celebrating the army's re-capture of Tiger Hills and the Bhupathi-Paes tennis victory at Wimbledon. Reporting on the action, said to be a turning point of the conflict, the reporter said, "They had reached the top, battling each inch of their way to the top". And later, "The night sky over the steep mountain remained an awesome orange throughout and the pungent smell of gunpowder filled the air".

All this despite the fact that journalists were unable to get to the actual scene of battle except in the last stages of the conflict. According to reports from Rahul Bedi (AA, July 23) and Gaurav C Sawant (IE, June 19), 'Hacks have a battle on their hands', reporters were not allowed to go beyond National Highway 1A till July 5 ('Army can't stem media invasion', AA, July 13). In the light of these revelations, what does one make of the report from the *Indian Express* on the recapture of Tiger Hills. Especially when the same report informs that there was no contact with the soldiers and there was 'complete radio silence'.

In the main, however, reportage was colourful and descriptive. Consider another report: "The flares lit up the night sky darkening the mood at the Drass HQ. The infantry soldiers were advancing slowly and cautiously". Or this one: "The pakis were a mean, hawk-eyed lot who slept during the day and kept vigil at night". This priceless quote was not even attributed to anyone, either army officers/jawans, local residents of Kargil, or even intelligence personnel. When the reporter could not have got within seeing distance of the 'pakis', how could this piece of fiction rear its head in a serious newspaper report?

A story headlined, 'Pakis play dirty, booby trap body of army officer', about

the handing over of the body of major R S Adhikari and three jawans (June 28, 1999), said that the Indian jawans "jumped at the offer since the thought of their beloved colleagues' bodies lying in the open was just too agonising". Again, there was simply no qualifications to such 'emotional' reportage and the statements were blithely reported, unattributed to any source.

The other newspapers were marginally better or worse. *The Times of India*, reporting the reactions of jawans to the cricket world cup, quoted a jawan as saying, "we need to settle this issue once and for all" and "Tell Sachin to take some rest as we blow the daylights out of Pakistan. They'd better know that this is not cricket, they just cannot win."

The editor of *Indian Express*, Shekhar Gupta, in an edit-page article entitled, 'Let the media witness the mess' (July 14, 1999), made an impassioned plea that journalists be allowed to cover the conflict from the battle-lines. Gupta argued that reporters at the front were young and enthusiastic but definitely too fond of their own lives to wilfully allow a '40 kg sonofabitch on our heads'. If one inferred from Gupta's article that journalists were indeed young and inexperienced, what were the newspapers sub-editors and editors doing? These and other instances clearly bring out the manner in which basic editorial checks and balances simply did not function, or were they allowed to sing a different tune?

For newspapers, all the action did not emanate from the front. The conflict opened up several other fronts. The battle-cry found its echo in remote villages, thanks to the army's new policy of dispatching home the bodies, not only of officers (as in the past) but also of jawans. Speaking of the change in policy ('Bodies replace urns as Army changes policy', *IE*, July 16), the newspapers marked this departure from the norm as a sign of the army's 'new openness' and readiness to facilitate the involvement of the entire population in the 'war-effort'.

The valour of death on the battle-field, the 'celebration' of the 'martyrdom' of the officer or soldier, the readiness of others (either from the family or those who attended the funeral) to 'give up' one more youth for the country and to war...this was the common theme running through these reports. The tragedy and futility of war, the sheer wastage of a life or even the loss to a family of an important member, perhaps a sole breadwinning member, these

sentiments were rarely reflected in news-reports.

A glaring example of a reporter's participation in this exercise: *The Asian Age* (July 4) reporting on the funeral of Lt Vijayant Thapa (headlined - 'Son of India') described how military police directed the public to the funeral site a police van with a loudspeaker beckoned everyone to pay homage to the soldier who had died. The report ended with the words: "and all that we Indians can do is to thank God for those brave soldiers who sacrifice their todays for the sake of our tomorrows."

But not all reports were celebratory. A report from the *Indian Express* (July 13) condemned the politicisation of death: 'Politics of patriotism shadows martyr's last rites' is said in a headline, adding that the next of kin were pushed aside as politicians turned the funeral into an opportunity to hog the limelight. If RSS functionaries dominated this funeral, the Congress was not far behind, taking over the funeral of Lt Saurabh Kalia in Palampur, (*IE*, June 13).

CALLING FOR CONSENSUS

Newspapers also vied with one another to obtain reactions from the upper strata of society. The *Indian Express* carried a daily feature titled, 'Calling for consensus', ostensibly to support the 'war' effort. The column featured celebrities from the more glamorous walks of life. The *TOI* (July 5) carried a full-page feature, 'Everybody loves a hero -- Mumhaiites on how they view the Indian soldier', peppered with the views of the smart set.

The newspapers also carried reports of the 1965/71 war veterans and highlight some instances of war widows still waiting for compensation (notably, *The Times of India* (July 11)) which devoted a full page to the issue) but these were few and far between, remained at the 'human interest' level and failed to trace the administrative negligence and corruption because of which compensation was swallowed up.

Every newspaper had its pet project for Kargil. The *TOI* fund was entitled 'Zara yaad karo qurbani' while the *IE* tied up with Iridium to provide phones for soldiers at the front. The *IE* even co-sponsored a programme, presumably a fundraiser, 'Aye watan tere liye' in Delhi on July 17, utilising for publicity, a photograph captioned 'tears of pride', showing the wife of an officer saluting the coffin of her husband.

All the other shows in the 'Kargil-utsav', from entertainment programmes, designer shows, corporate schemes for proceeds of sales of various products, opinion polls and other 'Kargil specials' received more than their fair share of publicity. The designers' show, according to the *Asian Age* (August 12) 'woke up too late, but when they did, they did it in style'!

The same newspaper (July 28) carried a report of a computer game 'I love India' wherein the user can cross the LOC and destroy Lahore. The tone of the report is laudatory and is meant, the reporter states blandly, "for all those who want to vent their anger at Pakistani intruders". There were a few articles in the edit pages of all three newspapers expressing distress at this trend (Nivedita Menon, 'Plastic patriotism in times of war', *TOI*; Mushirul Hasan's 'Don't teach me patriotism' *IE*, July 17, or Bachi Karkaria's 'Patriotism in a fashionable war', *TOI*, July 18) but these were virtually drowned in the sea of stories which publicised the corporate milking of Kargil.

What did the newspapers neglect or de-emphasise?

Communalisation of the conflict: The newspapers analysed refrained from any overt or covert communalisation of the Kargil conflict. Muslim soldiers who died in the action were specially mentioned, perhaps to reinforce that India was fighting an Islamic state with believers of Islam, though this was not spelt out. When several Muslim organisations came out in support of the Kargil action holding up placards proclaiming, 'We love India, we hate Pakistan', the press regretted the fact that Muslims had to exhibit their patriotism in this manner. However, there was one glaring omission: the coverage of riots in Ahmedabad and the involvement of the Hindu right in fomenting trouble. Riots were sparked off when protestors burnt effigies of Pakistan prime minister Nawaz Sharif and then continued their protest by raising anti-Muslim slogans. Preparations seemed underfoot much earlier as a report in the *Indian Express* (June 18) clearly indicated: 'BJP workers hone talent in effigy-making'. The BJP's Yuva Morcha president claimed that he had a master's degree in effigy making! Yet, alarm bells failed to ring.

The media and US mediation: Reportage on the US intervention gave no insights about the US new support for India. Instead, there was gratitude and childish glee at winning big brother's support. *IE*

gloated: 'Sharif on his knees as US says what Delhi wants' (July 6). Bilateralism was now a dirty word. In a signed article, the *Indian Express* editor Shekhar Gupta (June 30), actually chastised the government for parroting the 'no third party intervention' line of the past asking whether chanting this 'mantra' was smart?

Torture of six Indian soldiers: Front-paged reports in all newspapers mentioned the government and army's version of the mutilation of the soldiers. The incident marked a turning point in the conflict. Reporters either did not care, or practised self-censorship in the 'national interest', to ask basic questions: the motivation of Pakistan to return mutilated bodies, whether all or only one body was mutilated (as later reports) or the possibility of natural decomposition.

Financial costs of war and conflict: Newspapers scarcely touched upon any estimates about the losses of war and the Kargil action. The *Asian Age* was an exception in that it carried a solitary report quoting a study from Assocham on the short and long-term impact of the Kargil action, estimating the daily cost of the war at Rs 30 crore.

Again, newspapers were silent about who benefits from the conflict? Which arms manufacturers, apart from Bofors, would obtain extra orders thanks to Kargil? Or, more disturbing, the chorus to push up defence expenditure in the wake of the defence forces' ill-preparedness to deal with Kargil.

Intelligence failures: The *IE* mentioned in passing, without attributing its report to any source, that patrols in the area was discontinued. When and why it failed to mention. It also had a report that an 'Intelligence alert in 1997 on the LoC was ignored' (July 20). When *Outlook* newsmagazine stated that a top army officer had alerted his seniors about the infiltration, they instead carried the army's denial of the story. The *TOI* spoke of the lack of alertness of Indian intelligence when Pakistan placed orders with Austrian agencies for 50,000 pairs of snowshoes, thermal jackets, snow tents, etc. However, these reports were not attributed to any source and failed to confront the army, either in its daily briefing or otherwise. They simply died in the army's convenient 'maun-vrat'.

Kargil vs Siachen: Kargil, defence analysts said, was Pakistan's answer to Siachen. Yet newspapers, save for one or two reports (*IE*, *TOI*), did little to question the comparison; failed to suffi-

ciently give the public any historical analysis of the conflict or the meaning of LAC/LoC and the importance of bilateral negotiations.

The other side: What of the Indian press's coverage of Pak affairs? At the height of the Kargil action, Indian newspapers began paying attention to the Pak press. The *TOI* began a 'Periscope on Pak' and *IE* had 'The other side'. In the main, the snippets chosen highlighted the 'unreasonable' nature of people of Pakistan. *AA* was the only paper to print full-fledged articles which were both 'supportive' of the action of the 'freedom-fighters' and critical of the leadership of Nawaz Sharif and his mishandling of the Kargil situation.

The government's hand in misinformation: The caretaker government was ham-handed in the extreme. Reporters were disallowed anywhere near the scene of the action; Pak TV was blocked and VSNL jammed the *Dawn* newspaper website. And how did our press react? The protests and condemnations only seemed like feeble bleatings for all the effect they had on the government and army. *IE* magnanimously gave the information and broadcasting minister Pramod Mahajan a chance to give reasons: 'Why I blocked Pak TV' (June 30, 1999).

India's first televised war: Not a single newspaper or their television columnists discussed India's first televised war. Rajesh Joshi writing in *Outlook* (July 26), mentioned how TV newscasters dressed in battle-fatigues and standing in disused bunkers added just that authentic touch to their reports from the 'front'. Rajesh Ramachandran wrote in the *Hindustan Times* of being hit by shrapnel from a missile, the other side being alerted by lights carelessly switched on by a television crew. But other newspapers maintained a discreet silence about this.

National debate on Kargil: When the opposition raised the demand for a Rajya Sabha session on Kargil, the press meekly agreed that the all-party meeting was a apt substitute and that 'wrong timing' marked the opposition's demand (*IE*, June 25). It was to the dubious distinction of Congress member Mani Shankar Aiyar (*IE*, June 15) to point out that the present prime minister A B Vajpayee had demanded, and succeeded in obtaining, both a special RS session in 1962 during the war with China and the resignation of then defence minister Krishna Menon.

Inquiry into Kargil: The press did no serious evaluation of the prime minister's assurance that an inquiry would be con-

ducted into the Kargil action and the later statements by both the PM and the defence minister back-tracking on this assurance that the inquiry would not cover intelligence failure.

Despite the reams of matter in the newspapers and air-time devoted to Kargil, are we better informed? Are we in a position of trust vis-a-vis our government and media on the actual state of affairs on the border? Are we confident that the enormous sums of money spent on defence are being utilised correctly, leave alone justified? Or are we ready to accept the rising chorus of the hawks that the defence expenditure is 'inadequate' and needs to be upped, in the light of increasing aggression from our neighbour? Ten days after George Fernandes proclaimed that the last of the 'intruders had been driven out and the Kargil action was effectively at an end', why did 70 soldiers lose their lives?

The media failed to or chose not to seriously analyse who would be the ultimate losers in the Kargil confrontation. An overwhelming number of persons on both sides who died in battle were poor jawans. Increased military expenditure will also further be disproportionately borne on both sides by the poor in the form of indirect taxation. Little or no effort was made to bring out the fact that the common people in both countries had no stake in the war and that Kargil was simply reinforcing the fundamentalist forces on both sides of the border.

The elites consensus on the issue was also not carefully analysed and this should be understood in the context of the monopoly ownership of the media in the country, i.e., the owners of the media are themselves part of the ruling elite.

[The above is an abridged version of a detailed study on media coverage of Kargil conducted by the Centre for Monitoring the Media (CMM). The CMM is an independent, non-profit making organisation comprising mediapersons who analyse how various events are reflected in newspapers, magazines and television, laying bare the structure and subjective biases of the media.]

Delivering the Right to Development: ESCR and NGOs

Arjun Sengupta

Why do the masses in south Asia, and particularly India, not rise up in revolt against political repression, hunger, illiteracy and many other deprivations? There are various groups, each fighting for a different cause. There is nothing to bring them together to effect changes at the national level. Could NGOs fulfil this function?

JEAN DREZE and Amartya Sen in their book *India: Economic Development and Social Opportunity* (OUP, Delhi, 1995), quote a warning from John Dryden three hundred years ago: "Beware the fury of the patient man." They go on to say, "Successive governments in India have had reason enough to rely on the unending patience of the neglected and deprived millions in India, who have not risen in fury about illiteracy, hunger, illness or economic insecurity. The stubborn persistence of these deprivations has much to do with the lack of fury."

All revolutions in history were in effect the outbursts of that fury of the deprived and the downtrodden in the society of the time and most major changes in social orders had been the results of those revolutions. But not all revolutions have led to the removal of poverty or deprivation and the expressions of fury have often taken forms other than open rebellion, especially in democratic societies. Nevertheless it is true that outbursts of such fury or the threat of such outbursts often dislodged the forces of status quo and initiated changes in the system. If democracy works and the governments are truly representative, these threats and the pressures building up to these threats can work fairly early to redress the grievances or can lead to a change in the governments without a revolution. But fury or an articulation of public anger would almost always be a necessary condition to make vested interests give up their privileged position.

It is time we ask ourselves why that fury has not expressed itself in India, or in other countries in south Asia, to bring about the changes necessary to end the deprivations. Or, in other words, why has there been no revolution in these countries, or not even the creation of revolutionary conditions. It is not true that Indians are naturally non-violent or law-abiding citizens, who shun situations that may lead to violence. Either as individuals or groups, Indians have displayed the worst proclivity to violence. Nor is it the case that we have

no revolutionary parties, though their influence has dwindled over time, having given up practically all ambitions of revolution. There has, of course, been some economic and social change, not always so insignificant. But by and large they have made little dent on the conditions of widespread deprivation that Dreze and Sen were talking about. More than a third of India's population still live below the poverty line. As of 1995, about 665 million people have no access to sanitation, 178 million no access to safe water and about 145 million no access to health services. More than 250 million adults are illiterate, more than half of the children under five years of age are malnourished and underweight. The infant mortality rate in India is still among the highest in the world. The records in other countries are often much worse. There are enough of such statistics that can cause anguish if not anger. But somehow this does not get converted into 'fury' that can bring about revolutions.

One may offer several hypotheses to explain this situation and there can be serious debate on this for quite some time. The most plausible of these is the proposition that while there can be enough anguish and agitation, sometimes even leading to violent uprise around specific issues of deprivation and injustice of the people affected by them, it is not possible to combine them into an overwhelming national agitation and 'fury' unless there is one issue of almost universal concern that can unite all the groups on a common platform.

The issue of deprivation affects different people differently and there are so many and diverse points of grievance and agitation affecting the various groups that the forces of establishment have been able to keep them divided and prevent the individual group angers from coalescing into national fury. The political parties, especially of the left supporting the cause of revolution, have not been able to build up a national movement for revolutionary change, even though they may have

succeeded in pushing forward the cause of specific groups of people to redress specific grievances. It is not the parliamentary form of Indian Constitution that has thwarted the attempts at revolution in India. It is the failure to build up a national movement around an overriding cause that has failed to generate the conditions for any revolutionary change. This has been made worse by the lack of any agency to articulate the specific grievances in terms of such an overriding cause unifying all the deprived.

Historically, revolutions in the world occurred mostly around two basic causes: political freedom and equity. Whether it was the English Revolution, the French Revolution or the American Revolution, the uniting platform of all the diverse points of grievances and injustices was freedom and equity, which appealed directly to all concerned and which could incorporate all their individual grievances. This was articulated in terms of human rights – the rights which flowed from the concept of human dignity and irrespective of all the theoretical edifices in terms of divine or natural or legal rights that were built as philosophical basis of those demands for freedom and equity, their strength was their acceptance by all, especially all of those who were disaffected and who were prepared to rise up in revolt.

"In the ultimate analysis, human rights are those rights which are given by people to themselves. They are not granted by any authority, nor are they derived from some overriding natural or divine principles. They are human rights because they are recognised as such by a community of people, flowing from their own conception of human dignity, in which these rights are supposed to be inherent. Once they are accepted through a process of consensus-building, they become binding at least on those who are party to that process of acceptance" ('Study on the current state of progress in the implementation of the right to development' submitted by Arjun K Sengupta, independent expert, pursuant to Commission Resolution 1998/72 and General Assembly Resolution 53/155 (E/CN.4/1999/WG.18/2, July 27, 1999) ECOSOC, Geneva).

Indeed the crucial element in the natural right theories of John Locke and others that inspired the Glorious Revolution of 1688 was not so much that rights such as to life, liberty (freedom from arbitrary rule) and property pertain to individuals because they existed in "the state of nature". It was more importantly that people informing a civil society through a social contract, "surrendered to the state only the

right to enforce these natural rights, not the rights themselves", and that the state's failure to secure these natural rights gives rise to a right to popular revolution (Burns Weston, 'Human Rights', *New Encyclopedia Britannica*, 1992).

The American Declaration of Independence (1776) squarely put this point: "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their creator with certain inalienable rights, that among these are life, liberty and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed. That wherever any form of government becomes destructive of these ends, it is the right of the people to alter or abolish it..."

Those principles of freedom and equity were reflected again in the French Declaration of the Rights of Man and of the citizen of 1789: "Men are born and remain free and equal in rights." They remained the driving spirit of all radical movements of social change throughout the 19th century. The Bolshevik and the Chinese revolutions - the two major revolutions in the 20th century, championed the cause of equity, but had a convoluted, philosophical concept of freedom as freedom from necessity. That was quite different from the earlier concept of political freedom which got reflected in the principles of democracy. Still, these two revolutions got wide support because their advocacy of equity was based on a rich philosophy of social change in terms of grand theories of social and economic formation. These grand theories turned out to be flawed - which all grand theories tend to be. But that was not why these revolutions failed, the Bolshevik one literally, the Chinese one for all practical purposes. The main reason for their failure was their inability to incorporate political freedom in their design and conduct of the affairs of the state. It is possible to argue that almost all the shortcomings of their systems, which led to the large-scale disaffection of their people were the absence of their freedom, and to express, to organise and to choose their government.

Almost similar was the case of the only other popular revolution in the 20th century - the revolution in Iran. There also, the background to that revolution was a notion of equity, different from the Marxist or the western liberal notions, but a separate and self-consistent notion no doubt. And again, that revolution failed because of its position against the principles of individual and political freedom which disaffected most of the population.

Can we build up a cause in our countries that can unite all the downtrodden and

disaffected people suffering from specific grievances, economic and political deprivations and inequalities, as well as social and cultural injustices, around a concept of freedom, equity and justice? Let us not have a grand theory to explain all the problems of the economy and society. Nor do we need one general and overriding answer or approach or plan to solve all these problems. Specific situations need specific approaches. Each problem has to be solved in its own way. But there has to be one cause which may unite all the groups and one platform on which all those who are deprived, downtrodden and vulnerable can combine to give expression to their anguish and fury. I submit that cause can again be the championing of human rights, the cause of freedom, justice and equity which every individual has the right to claim by virtue of his identity as a human being. And elaborating that cause, we have the new theory that propounds the principle, the right to development is a human right, where development means economic growth with freedom, equity and justice.

Indeed the right to development, which was adopted by a universal declaration by the United Nations in 1986 and approved by a general consensus at Vienna in 1993 was a qualitative leap forward over the Universal Declaration of Human Right adopted more than 50 years ago. That first declaration was the outcome of a long drawn out international movement of human rights where freedom from want was one of the four fundamental freedoms that all human beings were entitled to claim. The Universal Declaration was expected to be followed by the enactment of one covenant incorporating all civil and political rights as well as economic, social and cultural rights, reflecting the vision of the original champions of the human rights movement. The rise of the cold war disrupted that process and we had two separate covenants, one on civil and political rights, and the other on economic, social and cultural rights, which gave these rights the sanctions of an international treaty. All this is history, but it is worth recounting, because with the adoption of the right to development, the two covenants have in effect been integrated and we are back where we had started from. Economic, social and cultural rights (ESCR) can no longer be seen in isolation from civil and political rights (CPR). They are not only interrelated but are actually integrated. A violation of ESCR would be regarded as a violation of CPR and vice versa.

For a long time the developing country representatives were saying that there cannot be any fulfilment of civil and political rights without development, by which they meant the fulfilment of

economic, social and cultural rights - an improvement of the standards of living and the security of jobs, food, shelter, health, education and social insurance. When they accepted the right to development, they recognised that these economic, social and cultural rights cannot be realised without political freedom or civil and political rights. There is a process of development with equity and justice where all freedoms of expanding opportunity and choice and fulfilling the rights are realised. Every person is entitled to that process of development as an inalienable human right (see the Declaration on the Right to Development, United Nations, 1986; and the Report of the independent expert, op cit).

What is even more important is that the right to development also specifies the way in which these rights have to be exercised - through transparency, accountability, effective participation and equality of access. So the economic, social and cultural rights which are now an integral element of the right to development must also be exercised in the same way. All programmes of action for implementing these rights must be transparent, with every beneficiary and every participant seeing fully who is doing what, and who is benefiting how from the programme, and who is sharing the cost and to what extent. All the programmes and their executors and beneficiaries must be accountable for the public trust bestowed upon them. Every person or agency involved with the programme must effectively and fully participate in the design and execution of the programmes. At no point, can the programme be seen as imposed on any group or being denied to anyone else. Finally, of course, both the design and the implementation of the programme must ensure the equality of access. Any person willing to accept the obligations of the programme must be able to access the services of the programme on an equal footing with all others involved.

In this framework and as an agency of executing public action that is behind converting public sentiment into programmes of change, civil society organisations and NGOs are going to be major instruments. The NGOs or non-governmental organisations are the generic terms used for civil society organisations working on different issues for different interest groups separately or in combination. They play the role of activists, executing programmes and delivering services and also as the mobilisers of opinions, awareness and support of the people concerned with and affected by social, economic and political problems.

The NGOs, by virtue of their being civil society organisations functioning as non-

profit voluntary agencies, have in this context a historic role to play, which political parties as organs of the state, trying to wield political power cannot always play. The NGOs can organise the people affected by specific deprivations into a national movement in terms of a unifying cause, cutting across the different interest groups. This is a difficult task, because the NGOs cannot become political parties or form alliances of interest groups to capture political power. But they can create the consciousness by articulating the grievances, upholding the rights, encountering the adversaries or even helping in delivering the programmes for redressing the problems, linking the separate individual causes together into a broad uniting platform so that all the anguish from specific deprivation becomes an overriding fury. It is not necessary that such fury finds its expression in revolutionary violence. But in democracies, that fury may take the form of intense pressure from diverse interest groups for the state machinery to act and the civil society to change. Dislodging the vested interests which have thrived in the systems that have perpetrated the deprivations for such a long time is almost a revolutionary task, but it can be achieved in a democracy without any violent uprising, if the pressure for change becomes overwhelming. The NGOs have much to contribute in the building up of that pressure. To act as agents of social change, the NGOs may have to adjust their behaviour significantly from the role that many of them currently play as the so-called 'development NGOs' as agents to deliver the programmes supported by international agencies and national governments. They may not be a part of the political machinery, but they have to be involved with generating political consciousness, because no enduring social change will be possible without that. Keeping these identities separate would be difficult, but in that would lie the strength of the NGOs with the image of disinterest in political power but dedicated to social change. They can still act as agents for delivering development, but with the full participation of the beneficiaries with transparency and accountability and for programmes to promote equity and social justice. With the new approach to the right to development, agencies for development are also agencies for human rights, playing both the roles of activism and of advocacy.

The single most important violation of economic, social and cultural rights and so also of the right to development is poverty, and eradication of that is no doubt the first aim of realising those fundamental rights. In a sense, poverty is an all-

encompassing term that encapsulates the violation of most of the economic, social and cultural rights and of human dignity, which is the basis of all human rights. Any agency involved in delivering and protecting human rights must naturally try to eradicate poverty in the most effective way.

As a first approximation, poverty is defined in terms of a benchmark standard of living represented by an index of consumption expenditure or income, and anyone having income or expenditures below that benchmark is taken as poor. There are national poverty lines where the benchmarks refer to national expenditure baskets. There are also international benchmarks, such as \$1 per day that is used by the World Bank for almost all developing countries. The number of persons below the poverty lines of different countries is periodically published which shows that the incidence of poverty is highest in south Asia and sub-Saharan Africa.

But this income/expenditure definition of poverty does not capture all the debilitating effects of poverty. The poor people are also undernourished, unhealthy with low life expectation, illiterate or poorly educated, with very little capability of improvement. They are also mostly unemployed with very little dignity left as individuals. In other words the poor people tend to remain poor. An anti-poverty approach must aim at removing all these incapacity, so that poverty eradication or even reduction can be sustained (see the *Human Development Reports* of the UNDP, published yearly; and also Mahbub ul Haq, *Reflections on Human Development*, 1995, Oxford University Press).

Most government policies, which are genuinely aimed at poverty eradication, would try first to raise the rate of growth of GDP and then prevent deterioration in the income distribution. GDP must grow faster than population, so that per capita income and consumption can rise, and if income distribution does not deteriorate and become more skewed, the class of people below the income (or expenditure) poverty lines will improve their levels of living leading to a fall in this level of absolute, though not relative poverty. But it is difficult for the government to achieve such high growth without deteriorating income distribution, if the civil society organisations, do not remain vigilant and mobilise pressure groups and agitations that prevent the growth of monopoly rents or activities that enrich the already rich. Without any non-governmental pressures for intervention, market forces would make the rich richer, and the governments usually would not

prevent the distributional deterioration. The NGOs can promote development maximising strategies moderating the market propelled purely GDP-raising activities. In other words, NGOs may have to play the role of keeping the government policies strictly on track of egalitarian income distribution.

The governments often try to supplement the incomes or consumption of the poor through specific policies that benefits the poor more than the rich. These are done through, (a) special supply of concessional foodgrains at subsidised prices to the targeted group of people who were known as poor, undernourished, unemployed and underprivileged, and (b) adoption of special programmes for income generation among the relatively poor. In both the cases the governments would badly need the help of the NGOs.

On specially targeted foodgrains distribution, the government would very much depend upon the NGOs—their ability to find methods of identifying the poor and help the governments to deliver the foodgrains to the genuinely poor with the least wastages in their amounts. The fact that the NGOs are not a part of the administration machinery would give them an image of impartiality which the local government agencies connected with local pressure groups may not have.

On adoption of special programmes, again the NGOs have the special advantage of the knowledge of local conditions, not only to design the programmes better but also monitor them effectively. The leakages in the employment generation schemes, or public works programmes, or special schemes of midday meals for children and nourishment of lactating mothers or deprived women members of the families can be effectively plugged only with the help of the NGOs.

Even for poverty eradication as for the general aim of delivering human rights, the greatest contribution that the NGOs can make is to spread consciousness. Individuals in all walks of life must become conscious of their rights – and once they are, half the battle is won. People must be able to claim their rights and make the governments meet their obligations.

The original proponents of human rights, both during the American and the French revolutions, declared that if the governments cannot deliver those fundamental rights, they have no business to govern and people have the right to throw them out. It is only when people can assert their right in such a way that things start to change. The NGOs have the responsibility of making the people conscious of their rights and translate their fury against the non-fulfilment of those rights into effective public action.

The Bomb: Debates in Pakistan

Kanti Bajpai

Pakistan and the Bomb: Public Opinion and Nuclear Options edited by Samina Ahmed and David Cortright; University of Notre Dame Press, Notre Dame, Indiana, 1998.

THE Kargil war between India and Pakistan dramatised the fact that the two countries now live under the shadow of nuclear weapons. When Pakistan attacked India in 1965, after having sent in 'irregulars' into the Indian part of Kashmir, India retaliated by crossing the border in Punjab and Rajasthan. The Indian army somewhat unexpectedly found itself at the doorsteps of Lahore. Under pressure, the Pakistani army had to restrict its operations along the line of control (LoC) and save Lahore. In the summer of 1999, retaliating to 'relieve the pressure on Kargil was no longer a serious option for New Delhi. Confronted by the possibility that Pakistan might use nuclear weapons to defend itself, India was in no position to do what it had so successfully done in 1965.

Pakistan and the Bomb, edited by Samina Ahmed and David Cortright, is a very useful and timely book in this context. It is not a history of the Pakistan nuclear weapons programme. It is more than that. Like its counterpart, *India and the Bomb: Public Opinion and Nuclear Choices*, edited by David Cortright and Amitabh Mattoo (Notre Dame University Press, 1996) it does two interesting things: first, it presents the results and analysis of a public opinion poll on nuclear policy; and second, it supports this with four chapters which look in some depth at the various nuclear choices before the country. Oddly, this kind of book has never been done before. No one, before these two volumes were published, had thought of a book that combined opinion data with analyses of the pros and cons of the various nuclear policy options before the two societies. The two books are almost identical in format. The Indian book appeared in 1996. The Pakistani book was written before the Pokhran II and Chagai blasts but appeared shortly thereafter. Both efforts were brought out under the auspices of the Notre Dame Studies on International Peace of the Joan B Kroc Institute for International Peace Studies, University of Notre Dame.

This review is divided into two parts: the first deals with the public opinion data on Pakistani nuclear choices; the second attempts to assess the four accompanying

analytical essays. I deal with the essays at some length because, after Kargil, it is vital that we in India get a sense of the length and breadth of the Pakistani nuclear debate.

PAKISTANI AND INDIAN OPINION ON NUCLEAR POLICY

The first thing that is striking about the Pakistani poll results is that they are virtually identical to the Indian survey on a number of questions. For instance, the supporters of official policy in Pakistan, those who supported the so-called 'ambiguity' option, were 61 per cent. Nuclear advocates, those who supported weaponisation, were 32 per cent. And nuclear opponents were 6 per cent. The figures in the Indian case were 57 per cent, 33 per cent and 8 per cent respectively. The rating of the nuclear issue vis-a-vis other social issues also shows a similarity. In Pakistan, it was ranked fifth after economic stability, Kashmir, ethnic and religious conflict, Afghan refugees presence; in India, it was ranked seventh, after communalism, poverty, economic stability, terrorism, Kashmir and GATT. In both Pakistan and India, about 20 per cent of the respondents said that information on nuclear issues was neither easy nor difficult to get. And 77 per cent in Pakistan and 67 per cent in India said information was 'not easy' to get or 'difficult' to 'almost impossible' to get. In both countries, 7 per cent said that they had never really paid any attention to their country's nuclear policy. Those who were 'well informed' or informed 'just enough' about nuclear policy constituted 87 per cent and 72 per cent of the sample, respectively. The vast majority of respondents, not surprisingly, replied that they had little or no influence on nuclear policy (93 per cent in Pakistan and 83 per cent in India). There was huge support for civilian nuclear energy – 94 per cent in Pakistan and 87 per cent in India. Interestingly, in both countries there was also solid support for an international agreement to eliminate nuclear weapons. In Pakistan, 97 per cent 'totally' support and 'support to some extent' an

international elimination agreement. In India, the corresponding figure is 94 per cent.

Having said that there were a number of striking similarities, there were also key differences among the two sets of opinions. In Pakistan, 80 per cent of the sample considered the nuclear issue 'very important' (even though they ranked it fifth among a list of social issues). In India, only 41 per cent said the same thing. All of those who opposed nuclear weapons in Pakistan thought the issue 'very important'. In India, the corresponding figure was only 40 per cent. This suggests perhaps that Pakistani opponents of the bomb are far more concerned about full-blown nuclearisation than Indian opponents. Some 20 per cent in Pakistan thought information on nuclear issues was impossible to get. Only 6 per cent of the Indian sample thought so. This may well reflect the relative openness of the Indian political system. A striking difference related to the benefits of nuclear energy. In Pakistan, only 23 per cent thought that the benefits of civilian nuclear energy outweigh its costs. In India, 60 per cent thought so. In other words Indians were about three times as optimistic about the benefits of civilian nuclear energy. Similarly, 92 per cent of the Pakistani sample felt that a civilian nuclear energy programme had 'high' environmental costs. Only 60 per cent of Indians felt the same way.

Getting to the issue of nuclear weapons more directly, only 3 per cent of those who supported a policy of nuclear ambiguity (neither testing nor giving up the nuclear option) replied that Pakistan could never give up the bomb. Amongst those who supported weaponisation, no one thought that Pakistan could not give up the bomb under any circumstance! In India, though, renunciation of the bomb was thought to be far less plausible. About 18 per cent of the ambiguity group thought India could never give up the bomb and 33 per cent of the pro-bomb group also replied that India could never renounce the bomb. Amongst ambiguity and pro-bomb supporters in Pakistan, over 90 per cent supported signing the NPT if India did so. No one would countenance unilateral renunciation in these two groups. In India, only 35 per cent of the ambiguity supporters and 31 per cent of the pro-bomb would support signing the NPT if Pakistan signed. This, clearly, reflects the traditional Indian stand against the treaty. But, oddly, in the Indian case, 17 per cent of the ambiguity

group and 16 per cent of the pro-bomb group would sign it unilaterally! Less than 10 per cent of the ambiguity and pro-bomb group in Pakistan totally reject the NPT. In India, the figures are much higher: 49 per cent and 52 per cent, respectively.

One of the most telling differences is of course on the issue of nuclear weapons motivations. All of the pro-bomb group in Pakistan said that their country should develop the bomb against threats from India. No other threat warranted nuclear weapons. In India, the picture, expectedly, was different. Amongst the pro-bomb group, 57 per cent thought the bomb should be for threats from 'nuclear Pakistan'. Forty-nine per cent thought that it would improve India's bargaining power in the world, and 38 per cent thought it would enhance India's status. Interestingly, only 20 per cent saw the bomb in relation to a threat from China. The Indo-centric nature of Pakistan's nuclear concerns is revealed also by the fact that 96 per cent of the pro-bomb group thought that Pakistan needed to develop a nuclear arsenal "capable of striking *only India*" (emphasis mine). In India, only 12 per cent of the pro-bomb group supported the development of an arsenal "capable of striking *only Pakistan*" (emphasis mine). Thirty-five per cent of the Indians wanted the capability to strike all nuclear powers and 34 per cent wanted to develop all the components of the bomb but not actually assemble the devices.

Finally, Pakistanis and Indians differed on the issue of when their country could actually use the bomb. Pakistanis could only countenance using the bomb against India and in two circumstances - if India were about to attack across the border (98 per cent) and if India were to intervene across the LoC (77 per cent). In light of Kargil, and the call by some in India to cross the border or LoC to relieve the military pressure, this finding assumes some importance. By contrast, in India, only 33 per cent thought that India could use nuclear weapons if Pakistan were "about to take over Kashmir". Twenty-three per cent thought India could use nuclear weapons "if China were about to overwhelm India militarily". And 27 per cent could countenance its being used "if a US-led military coalition...were to intervene militarily". China is, interestingly, at the bottom of the list in terms of who the bomb could be used against. But the key difference is that only about one-third of the Indian sample thought nuclear weapons could ever be used, whereas virtually every Pakistani thought it was usable - and against India. Forty-four per

cent of the Indian sample said India could never use the bomb; only 1 per cent of Pakistanis said that.

I present these figures crudely and with no great comment as to their validity and overall meaning. It is worth noting that trained pollsters who spent up to 30 minutes with the respondents carried out both polls. They polled 1,000 'elites' in eight cities in Pakistan and seven cities in India. These are not rural, ordinary folks or small to medium town dwellers giving their opinion. The polls do not necessarily tell the whole story about public opinion, therefore, but until we get something larger and more variegated, these results do tell us something more than we knew before.

If I had a criticism of the Ahmed and Cortright essay at the beginning of the book, that attempts to summarise and interpret the findings of the Pakistani poll, it is that it did not do what I have only very summarily done here, namely, to contrast and compare the Pakistani and Indian cases. For instance, if these views are at all representative, then the findings may well have implications for future India-Pakistan conflicts and the whole issue of deterrence and how it may or may not work in the subcontinent. Thus, it seems clear that any attempt by India to cross into Pakistan militarily could lead to a nuclear strike against either our forces or our cities. The reverse does not seem as true. Indians seem reluctant to sanction nuclear use against a Pakistani incursion. Is this because Indians see this as not a very likely possibility? Or because there is a sense that India can beat Pakistani forces back without nuclear weapons? Or is there a greater reluctance in India to actually use nuclear weapons?

In the Cortright and Mattoo volume on India, the nuclear choices before India (in 1996) were: the then dominant preference, namely, ambiguity; nuclear abstinence (or renunciation); capping or freezing nuclear capabilities; and overt weaponisation. The Ahmed and Cortright volume on Pakistan divide up the choices before Pakistan the same way. At the outset, I should say that these are all high quality essays and are both informative and analytically rewarding. If I had to pick the prize offerings, though, they would be the essays by Zia Mian and Pervez Hoodbhoy.

The first essay, on ambiguity, is by Zahid Hussain, a leading Pakistani journalist specialising on defence and security issues. This essay was supposed to present the ambiguity case for Pakistan. It is, in essence though, a very solid recap of Pakistan's nuclear history from 1970 onwards. The story is a fairly standard

account of the development of the nuclear programme in this period. A good bit of the information is available in other works such as Ashok Kapur's *Pakistan's Nuclear Development* (Croom Helm, London, 1987); but Hussain brings the history up to 1996 when Pakistan followed India's lead in rejecting the CTBT. Anyone who wants a quick overview of the Pakistani programme up to the CTBT can read Hussain along with the Ahmed and Cortright essay on the weaponisation option, the final essay in the book, with profit.

Three rather interesting points are worth noting in Hussain's recounting of this period. The first is his contention that Pakistan's defeat in 1971, India's Pokhran test of 1974, and the 1984 scare to the effect that India was planning a pre-emptive attack on Kahuta were key milestones in Pakistan's determination to develop the weapons option. Also important though was the 1973 oil crisis, which suggested to Pakistani decision-makers that nuclear energy was a key alternative to oil. That Pakistan seriously considered the nuclear programme in terms of civilian applications is a controversial claim. Most Indian analysts, for instance, are convinced that the Pakistani nuclear programme has no motive other than a military one, against India.

A second point of interest in Hussain's history is confirmation of a point that Indians have often made, namely, that the various offers from Pakistan in the 1980s on some sort of a bilateral nuclear deal were bluff and propaganda. Pakistan, it will be recalled, had offered to accede to the NPT with India, to accept full-scope safeguards along with India, to construct a bilateral inspections regime, and to sign a regional or bilateral test ban treaty. Hussain notes that Pakistan made the offers knowing India would reject them all out of hand (p 36).

The third point of interest is his claim that Pakistani decision-makers have seen in the bomb a shield against an Indian conventional military attack. He cites Nawaz Sharif's statement, during a visit to Kashmir in 1994, to the effect that Pakistan would use its nuclear capability to protect its interest in the contested state. This is a point that is repeated and elaborated upon by Pervez Hoodbhoy. I mark it because of course one can see that the Kargil crisis in a sense grows out of the May 1998 tests and Pakistan's subsequent confidence that it finally possessed the Great Equaliser, no ifs or buts.

There are two disappointments in the essay. First, Hussain has nothing to say,

except in passing, about a crucial part of Pakistan's nuclear history, namely, the Pakistan-China nexus on nuclear technology. He deals with the issue in two sentences (p 35) and merely notes that, according to the US state department, there is evidence that Beijing did indeed help China. As western sources of nuclear-related technology dried up, China apparently moved in. Why the Chinese helped Pakistan is not addressed by Hussain. And yet, over 50 years, one important thing we have learned is that no nuclear power has gone out of its way to help even an ally attain nuclear capability. Why have the Chinese been different? What were their calculations? Is it credible that Beijing simply wanted to 'balance' India, as if it could not do so by itself? What leverage does Pakistan have in the relationship? These are vital questions historically.

The second disappointment is more important, and it relates to what the essay was supposed to do and does not do. It was supposed to lay before the reader the reasons why ambiguity was Pakistan's preferred option all these years when it is clear that, after 1984, the country was capable of testing a device. Was there a view that ambiguity suffices to deter, as some in India were arguing in respect of India's nuclear posture? Was there a sense that restraint was a diplomatic necessity? Hussain seems to suggest that this was the primary concern, but he is not particularly crisp on this point. On the other hand, were Pakistani capabilities the restraining factor? Was Pakistan simply not ready to go nuclear, in terms of fissile material stock, the engineering of the actual device, and so on? In sum, Hussain provides a useful overview of Pakistani official policy until 1996 or so, but does not present a very convincing explanation about why Pakistan did not go nuclear earlier.

RENOUNCING NUCLEAR WEAPONS

The second essay on nuclear choices in the volume is perhaps the most engaging and provocative. I say this not because, in the sister volume on India, I wrote the companion piece and am therefore a fellow traveller intellectually, but because it is a cogently, passionately, and crisply written piece.

Zia presents seven arguments for renouncing the bomb. First, the pro-bomb deterrence arguments are susceptible to moral counterarguments. The basic contention against the bomb on this score is that since it is immoral to kill millions of innocent non-combatants it is also immoral to threaten to do so which is what

deterrence rests on. This is a staple of the moral attack on deterrence but it rarely gets mentioned – I did not mention it in my chapter – in south Asia and is therefore an important reminder. Second, the consequences of nuclear use are indeed horrific, Zia points out, and renunciation can be justified on this basis alone. He drives his point home by citing two Indian scholars, S Rashid Naim (presently at Georgia State University in Atlanta) and M V Ramana (presently at Princeton University), both of whom have estimated what a nuclear attack would do to south Asian cities.

Zia's third argument against the bomb is that the bomb kills, maims and hurts, even when it is not used. The health damage to those working in nuclear plants and to those who mine and handle the uranium is grave, and we in south Asia have no real comprehension of the toll it has taken. Here Zia cites an incident that most Indians will not have heard of, namely, a strike at Kahuta in 1996 by 500 workers who demanded better pay, compensation, medical facilities, and safety measures (p 49). The strike was severe enough that it had to be put down by the Pakistani government more or less forcibly. The construction of the Khushab reactor on the river Jhelum is also a risky venture environmentally. An accident at Khushab would put virtually all of Punjab and Sind at risk (p 50). The fourth argument against the bomb relates to the economic costs. Zia's estimate is that \$1 billion has certainly already been spent. If one includes the cost of Khushab, of the heavy water plant to supply it, and of the reprocessing plant to extract the plutonium from the reactor fuel, then at current prices one has to add another \$1 billion in expenses. Hoodbhoy puts the figure even higher, at somewhere near \$4 billion (p 75, 77). The opportunity cost, Zia points out, has a social effect. Uneven economic development has led to social disintegration on a national scale, with one community pitted against the other for more of the small and often stagnant economic pie.

This leads Zia on to make a fifth argument, namely, that the nuclear programme has led to a militarisation of Pakistani society. In a section he calls 'Creating Support for the Bomb', he argues that the high degree of support for the bomb along with lack of knowledge about nuclear matters (as revealed by the opinion poll) has been sustained by an indoctrination process centred about the villainy of India (p 54). That indoctrination begins with the school curriculum. Amongst other things, Pakistani children, he notes, are "expected

to 'collect the pictures of policemen, soldiers, and national guards'" (p 54). Along with indoctrination goes manipulation of the media and intimidation of those who question the bomb programme and who have been involved in track two peace efforts with Indian counterparts. All this amounts to a massive militarisation of Pakistani society that spells danger for Pakistanis and for Indians.

Even more important in some ways than these five arguments, though, is Zia's attack against the strategic logic of the bomb. In effect, as I tried to do in my companion piece, he takes on the pro-bomb wallahs on their own turf. The first strategic counter-argument he puts forward is that the bomb does not provide defence. If Pakistan's bomb is supposed to deter India's bomb, the prior question is: can India use its bomb to blackmail Pakistan if Pakistan did not possess the bomb? Zia argues that the evidence from the nuclear age is that nuclear threats even against non-nuclear states did not work and, conversely, that even when both the US and Soviet Union were at par in nuclear terms it did not stop one or the other from using nuclear threats (p 57). In the India-Pakistan context, he notes that India, after 1974, could have resorted to nuclear threats but did not do so. If nuclear weapons can't be used for or prevent nuclear blackmail, what can they do? Deter? Even this, Zia notes, is hard to prove: did nuclear weapons deter each other in the cold war and keep the peace, or was it the case that neither side sought the other's conquest or destruction?

The second counterargument Zia makes is against the view that nuclear weapons can prevent India using its conventional forces to invade Pakistan. This implies that Pakistan would be prepared to kill millions of Indians and that it would be prepared in turn to risk massive nuclear retaliation from India. This, he suggests, is irrational in any sense of the term 'irrational'. In any case, India may be tempted to go first in such a situation, and Pakistan, realising that India may be tempted to do so, would in turn be tempted to pre-empt, and so on in an infinite regress. This is the logic of 'pre-empting the pre-empter' which strategic thinkers have understood and feared virtually since the dawn of the nuclear age.

In the end, Zia argues that nuclearisation is folly and that Pakistan would be best served by giving up nuclear weapons unilaterally. I won't replay his arguments about unilateralism here except to say that he makes a strong and reasoned case and certainly the most convincing one mounted by any Pakistani, perhaps any south Asian,

for giving up nuclear weapons and doing so regardless of what the other side does.

Pervez Hoodbhoy's essay on 'Pakistan's Nuclear Future' is the third essay on nuclear choices. Hoodbhoy differs with Zia on the political feasibility of renunciation, but it is clear enough that that is where his sympathies reside. Interestingly, like Zia, Hoodbhoy is a nuclear physicist and arms control expert.

Hoodbhoy, first of all, probes Pakistani motivations for the bomb. The first motivation is deterrence. Hoodbhoy is sceptical about the Pakistani deterrence argument for at least three reasons. For one thing, India cannot seriously want to undo partition and therefore has no reason to conquer Pakistan. Second, occupation of Pakistan after a military defeat in war is not a possibility given the limits on Indian military power. Finally, not every relatively weak power seeks the bomb as an equaliser.

Pakistani motives therefore go deeper, and here Hoodbhoy sees three lines of reasoning for the bomb. First of all, there is, as hinted at by Hussain, the nuclear shield doctrine according to which Pakistan can continue to provide support to Kashmiri militants secure in the knowledge that a retaliatory invasion by India is ruled out given Pakistani nuclear capabilities. In the wake of Kargil, we should note Hoodbhoy's statement to the effect that "The 'nuclear shield' logic is now a de facto element of Pakistani policy even if it has never been officially articulated" (p 71). Hoodbhoy suggests that the so-called 1990 crisis confirmed for Pakistanis the value of the nuclear shield. The second deeper motive for the bomb is "more psychological" (p 72). As Pakistanis have grown more pessimistic about their country's future and as processes and institutions of governance have decayed, a crisis of self-confidence has set in – to the point that "More and more Pakistanis in the English language press ask what was gained from partition..." (p 73) In this situation, the bomb gives Pakistanis comfort. The third factor behind the bomb is the military's dominance in Pakistani decision-making. The military, as other militaries, wants the biggest weapons available. Their control over strategic issues has meant that the nuclear weapons programme is beyond questioning.

The consequences of the bomb option worry Hoodbhoy who is not persuaded that a small arsenal will suffice. There will be a tendency, given the three imperatives he outlines, for the numbers to grow. The economic costs of the bomb will be enormous for a country that is already in

horrendous economic shape. This is particularly so because the 'ancillary' costs will be extremely high. He reminds us here of US estimates that the actual warheads accounted for a mere 8 percent of American defence expenditures after the second world war. The bulk of the spending went into delivery vehicles and command and control! Beyond the economic costs are two other costs that will eventually affect the nuclear programme itself. First, with economic strain, even collapse, Pakistani society and politics will tend towards implosion (rather like the Soviet Union). Second, the economic burden will have the ironic effect of draining the very talent needed to develop the bomb programme to its next level, that of bigger and more efficient bombs. Thus, Hoodbhoy argues that defence spending has seriously hurt the country's higher education system, and it will not be possible to train enough high quality scientists for the next generation of the bomb programme. Hoodbhoy presents an interesting dialectic. The more money the army and government put into defence including the nuclear programme, the more they beggar education. The more they beggar education, the less likely they are to produce the talent that can take the nuclear programme forward.

If rollback and renunciation are politically infeasible options, what can be

done? Hoodbhoy argues that a number of relatively small steps can be taken to reduce tensions between India and Pakistan. The big steps – signing the NPT, a South Asian Nuclear Weapons Free Zone, a fissile materials cut-off – are fraught with difficulties. India will not sign the first two, and Pakistan has problems with the cut-off. Contrary to the standard Pakistani position, Hoodbhoy endorses the idea of a no first use policy, arguing that since Pakistan cannot rationally use nuclear weapons against India (because Indian retaliation will destroy Pakistan), a no first use agreement could reduce tensions and bring India to the bargaining table. India of course has formally tabled the idea of a no first use agreement (at Lahore). More importantly, Hoodbhoy believes that a treaty banning the production of tritium – which is a booster in fission bombs and is therefore also used in fusion devices (because boosted fission bombs trigger the fusion process) – would be a good and modest beginning to get serious nuclear talks going, to prevent an escalation of the arms race, and to build confidence.

Hoodbhoy's essay is a very sober, realistic intervention and not just for Pakistanis. Many of his judgments about the motives, dynamics, limits, and political problems associated with the bomb apply to India as well, though perhaps not in

The University of California, Berkeley invites applications for a tenured position in South Asian Studies beginning in the 2000-2001 academic year. Candidates in any social science discipline whose work is committed to the study of contemporary India will be considered. The appointment will be made to the department of the successful applicant's expertise. Capacity and willingness to serve a term at some point in the future as the chair of Berkeley's Center for South Asian Studies also will receive positive consideration. It is expected that an endowed Chair in India Studies will accompany the appointment. Applications with vitae, names of at least three references, and other relevant supporting materials should be sent to **Ms. Gail Stern, South Asia Search Committee, International and Area Studies, 260 Stephens Hall, University of California, Berkeley 94720-2300 by October 31, 1999.** The University of California is an Affirmative Action, Equal Opportunity Employer.

equal measure. Having said that, parts of the essay seem to have been overtaken by events. For instance, Hoodbhoy seems pessimistic about the chances of Pakistan signing the CTBT. Clearly, after the Chagai tests, Islamabad's reluctance may have changed. So, also, he argues that signing a fissile materials cut-off will be difficult for Pakistan. Is this true after Chagai, particularly now that India has shown an interest in taking the cut-off treaty negotiations more seriously? Hoodbhoy argues for a no first use agreement in south Asia, but Pakistani opposition to the idea still seems very strong, in the wake of Chagai. As for a tritium treaty with India, this will run into the problem that there is growing interest in India in having the full range of nuclear weaponry right up to the fusion bomb, in which case tritium will become more, not less, important. Thus, post May 1998, India and Pakistan may be in a position to go further on some things than Hoodbhoy envisaged in his essay and less far on others – both could sign the CTBT and eventually a cut-off but not be able to agree to a tritium treaty.

GOING NUCLEAR

The final essay, by Ahmed and Cortright, examines the weaponisation option for Pakistan. The chapter sets the Pakistani nuclear programme, briefly, in historical context and examines also very briefly Pakistani motives for the bomb. This part of the essay mostly covers well known ground. Where it is more useful, indeed prophetic, is in its assessments of the consequences of going nuclear.

Ahmed and Cortright basically argue that Pakistan would complicate its strategic situation vis-a-vis India by going nuclear and that it would face a number of rather serious external pressures particularly in light of its economic difficulties. With the bomb, it would be tempting for Pakistanis to think that they are more secure, as the pro-bomb lobby argues, but in fact a number of serious problems will arise. Any attempt to use the bomb against India would encounter the problem that India has a much larger arsenal and that it is much harder for Pakistan to target India's more distant cities and value targets, whereas the reverse is not true. Second, given Pakistan's limited size, India may be able to think in terms of a first strike against Pakistan. Third, given the proximity of the two countries, early warning in the India-Pakistan case will be very limited. Accidental or inadvertent war will therefore be a more serious danger here than in US-Soviet interactions in the cold war. This problem will be compounded by the fact

that with the military's dominance, Pakistan's command and control may not be in the hands of its civilian leadership, thus complicating the question of who has his or her hand on the button. How much confidence India can have in Pakistan's command and control is questionable. If it lacks confidence in Pakistan's command and control, it may have to move towards more risky postures itself.

Ahmed and Cortright illustrate the potential seriousness of command and control problems by recounting the Ojheri incident on April 10, 1988 when an ammunition dump blew up near Rawalpindi and Islamabad and, crucially, not far from Kahuta, Pakistan's main nuclear uranium processing facility. In the ensuing confusion, it was widely rumoured that an Indian attack was underway. Had Kahuta been damaged, there would have been fallout, but more seriously there was the danger that Pakistan, in momentary ignorance of the real cause of the explosion could have attributed the blast to an Indian pre-emptive strike. If so, it might have prepared to carry out a retaliatory strike. India, sensing that Pakistan might be doing so, could well have begun preparations for the very pre-emptive strike that it was suspected of already having attempted. At that point, India and Pakistan would have been caught in a terrible, escalating vortex.

If Pakistan went nuclear, it would have to face not only the strategic challenge of India, but also the wrath of the international community. Here Ahmed and Cortright are prophetic. They suggest that sanctions would follow and that this would hurt Pakistan more than India. They note also that Japan would cut ODA and other assistance. The Europeans too would take economic action against Pakistan. Interestingly, they predict that China's reaction to a Pakistani test or to an escalation of the conflict in, say, Kashmir would be negative. In the aftermath of Kargil, we can see that their predictions were rather accurate.

Having sketched out the likely course of international pressures, they argue that sanctions and pressures on Pakistan may have the opposite reaction, namely, of a rally round the flag response. Thus, they argue that the international community should adopt an incentive based strategy which empowers democratic forces in civil society so that there can be a far more comprehensive and far-reaching debate on nuclear issues and so that the much larger issue of societal security is advanced. They also suggest that debt rescheduling might be a powerful incentive in limiting Pakistan's nuclearisation.

Ahmed and Cortright are at their strongest in the chapter in respect of India-Pakistan dynamics in an overt nuclear situation and the international repercussions of going nuclear. As noted, they are prophetic on the reactions of the external powers to Pakistan's nuclear tests. Where the chapter is not so satisfactory is in portraying the motives for nuclearisation. The arguments of the pro-bomb lobby are rather too summarily treated. For instance, it would have been interesting to lay bare some of the differences amongst the weaponisers, something that Varun Sahni did in the Indian volume. Certainly, in India, it is clear that, post-Pokhran II, there are various schools amongst the pro-bomb group. Surely something similar must be true for Pakistan.

The other major problem is that Ahmed and Cortright's argument about international incentives to encourage nuclear restraint in Pakistan does not particularly convince – or at least it raises as many questions as it disposes of. It is true that an incentives strategy aimed at the Pakistani military is not a terribly good idea. Incentives for civil society groups may not be quite the answer either though. First of all, what is the influence of these groups in Pakistan, especially in relation to the military that has such power and prominence? Second, will the Pakistani government allow foreign funding of, and contacts with, groups in civil society? Third, who in civil society should be empowered? As in India, there are groups that are mere front organisations and others that are simply incompetent. Fourth, with the May 1998 tests and the subsequent dialogues with Pakistan, a more traditional state-to-state policy may be both quicker and more effective: encouraging Pakistan down the road of the CTBT and fissile cut-off may do more for restraint than civil society empowerment.

Pakistan and the Bomb is indispensable reading in the aftermath of Kargil. There is no book in recent memory, as far as I am aware, that is quite as informative, reasoned, descriptively rich and analytically rigorous on Pakistani nuclear thinking and choices as this slim volume. Unfortunately, the book is not yet widely available in India. My review has therefore departed from the usual length and style of such pieces and taken the liberty of presenting in some detail the major arguments and findings of the volume. After the events of this summer, it is imperative that we in India get a clearer sense of Pakistani debates and concerns on such a vital issue.

**Statement of Shri D. Basu,
Chairman of the Board of
Directors of Securities Trading
Corporation of India Limited at
the Fifth Annual General
Meeting of the Company held at
Mumbai on September 27, 1999.**

I have great pleasure in welcoming you all to the Fifth Annual General Meeting of your Company.

The report of the Directors and the audited accounts of the Company for the year ended March 31, 1999, the fourth full year of operations of the Company, have already been circulated and with your permission, I would take them up next.

There were changes in the Company's Board during the year and these have been detailed in the Directors' Report. The only subsequent development has been that Dr. Arjun K. Bhargava, the noted Economist and former Member of Planning Commission, has recently accepted our invitation to join the Board. I look forward to his valuable counsel and guidance at our Board Meetings.

As you will have observed from the Directors' Report and the accounts, the profit after tax of the Company for 1998-99 amounted to Rs 82.98 crores against Rs 98.36 crore for 1997-98, reflecting a decline of 16 per cent in net earnings. The reasons for the decline in profit have been dealt with in some detail in the Directors' Report. Just to recapitulate, profit declined mainly on account of reduced trading opportunities due to abundant supply of Government paper, both through primary issues and sales through Reserve Bank of India's open market window, and higher funding costs, unmatched by any increase in yields on Government securities. Decline in profit has been a phenomenon witnessed across all Primary Dealers in 1998-99 and reflected a stiffening of the operating environment for Primary Dealers during the year.

Your Company continued to maintain its leadership position as a Primary Dealer in 1998-99. Its market share in the primary issues, reckoned on the basis of successful bids in auctions, including developments against underwriting, was 28 per cent, highest amongst the Primary Dealers. Its market share in transactions in the secondary market was 26 per cent which was again the

SECURITIES TRADING CORPORATION OF INDIA LIMITED

Regd. Office : Krishna C

highest amongst all Primary Dealers. It would be the Company's endeavour to maintain its leading position amongst Primary Dealers during the current year as well as in the future.

OUTLOOK AND PERFORMANCE OF THE COMPANY IN THE CURRENT YEAR

As I speak to you today, I do so in an environment of high short term interest rates which belies the expectation at the commencement of the financial year that following the cuts in Bank Rate, RBI Repo Rate and CRR in March 1999, we would be moving on to a period of softer short term interest rates. The high call money rates that have prevailed in the past months have

increase in yield in Government securities, in fact, the yield has been steadily declining despite the high market borrowing programme of the Government. Yield 10 year Government dated securities primary issues declined from 12 per cent in April 1999 to 11.60 per cent in September 1999, a fall of 40 basis points in a five months. The continuing strong appetite for Government Securities among commercial banks and the insurance and an adroit mix of primary issues, and private placements with RBI enabled the Government to continue borrow at low rates. The interest earned by the Company has thus been greater stress than in 1998-99. Unless monetary authorities take steps to ease short term liquidity conditions, and seemingly linked to its Exchange management policy, the probability of recovery in spread, in the current financial year seems a distant possibility despite expectation that the actual level of Government borrowing this year will

Total Income and Profit

pushed up the funding cost of Primary Dealers to a level well above the average funding cost in 1998-99, which itself was

Turnover in Secondary Market

regarded as high when compared to that of the preceding year. Your Company, like most other Primary Dealers, has had to resort to RBI's refinancing facility pretty much on an ongoing basis, frequently utilising the costlier Level II facility. As in last year, the increased funding cost has not been matched by any

exceed the planned level of Rs 84,000. With regard to trading profits, competition for trading have once again become stiff with rise of short term rates. As is the trading in gilts becomes subdued when short term interest rates rise.

Recognising the foregoing shifts in operating environment, your Company adjusted its business strategy this year. It has been seeking to boost its trading as assured income by maintaining a large inventory of gilts, giving closer attention to the same time to management of its risks. So far, this strategy has paid a dividend and the Company's out-

rs, 59 Sir Vithaldas Thackersey Marg, New Marine Lines, Mumbai - 400 020.

turnover in Government dated securities in secondary market during April - August 1999 has registered a handsome growth of 50 per cent over the level of such turnover in the corresponding period of last year. This has led to higher trading and spread incomes in absolute terms and I am happy to report that despite significantly higher funding cost, our unaudited estimate of pre-tax profit till September end this year is ahead of our pre-tax profit upto the end of September last year by approximately 20 per cent. If this trend continues in the remaining six months, I expect the Company to close the current financial year with better profit performance than FY 1998-99.

As for the Company's performance as a Primary Dealer, it has already completed 94 per cent and 83 per cent of its annual bidding commitments for the current year in respect of Government dated securities and Treasury Bills respectively. There should be no difficulty at all in completing the remainder of the bidding commitment.

Commitments achieved in Treasury Bills respectively, in six

Government Dated Securities
eriod last year
over the corresponding period

due to RBI. The Company's success ratios in auctions this year so far has been 58 per cent and 43 per cent in respect of Government dated securities and Treasury Bills as against the required minimum of 33 per cent and 40 per cent respectively stipulated by RBI.

DEVELOPMENTS IN GOVERNMENT SECURITIES MARKET

There have been continued reforms in the money and Government securities markets which is a welcome trend. The recent introduction of interest rate derivatives is also a positive move as it opens up the feasibility

of hedging interest rate risks. It is hoped that RBI will continue with further reforms of the Government Securities market especially by generally permitting non-bank corporates and institutions to participate in the repo market and permitting trading in Government Securities on 'when issued' basis once an auction is announced.

A welcome development in the Government Securities market in recent times has been the arrival of Gilt Funds. The Mutual Fund industry deserves to be complimented for setting up Gilt Funds which have attracted positive investor interest and would enable retail investors to invest in gilts which they have so far found it difficult to do. For procedural hassles. Your Company is keen to consider supporting Gilt Funds in their operations by making available repo facilities, by offering liquidity through term two way quotes and by supplying strips that they require from time to time.

THE BUSINESS OF PRIMARY DEALERS

The scheme of Primary Dealers has now been in existence for over 3 years and these institutions have grown into a key element of the infrastructure in Government securities market. It is generally acknowledged that Primary Dealers have added much needed liquidity to the gilt market and volumes in secondary market in gilts have gone up considerably. Reserve Bank has been very supportive to the community of Primary Dealers which has recently increased in size to 14 with the notification of 5 new Primary Dealers. Reserve Bank has relaxed the term of underwriting fee commission payable to Primary Dealers and also the liquidity support scheme, particularly by removing the uncertainty that prevailed in the past regarding the availability of liquidity support. I am confident that Reserve Bank will further relax these arrangements as warranted by experience in consultation with Primary Dealers. There are, however, still some major issues which affect the functioning and viability of Primary Dealers and these require to be addressed urgently. One issue relates to sources and cost of funding for Primary Dealers. Given the average yield on assets carried in the books of Primary Dealers, viz. Treasury Bills and Government dated securities, the only sources of cost effective funding that Primary Dealers can consider today are the call money market and RBI's refinancing facility. High call money rates as also the high rate on RBI's Level II refinancing facility affect the viability of the Primary Dealers. Banks are still not allowed to lend to Primary Dealers below prime lending rates and this source is thus ruled out for funding inventory of Government securities. As and when repo market is further opened up, generally permitting corporates and institutions to participate therein, Primary Dealers may be

able to source cost effective funds from that market. Until that happens, Primary Dealers can only look to RBI for lowering the cost of Level II refinancing and also to provide additional assistance to Primary Dealers when short term rates shoot up requiring, in turn, buying support to gilt market.

The other important issue is of building up a more constructive relationship between RBI's open market window and the Primary Dealers. RBI's Scheme of Primary Dealers itself envisaged favoured access to open market operations being given to Primary Dealers, this is yet to happen. As a matter of fact, RBI's open market operations have often led to a situation of competition to Primary Dealers. This and some of the other issues affecting the business of Primary Dealers have recently been highlighted by the Chairman of the Primary Dealers' Association of India and it is hoped that Reserve Bank would consider the Association's submissions favourably.

DIVERSIFICATION OF BUSINESS

Last year, I had touched upon the need for companies like NGCI to diversify their activities in view of the fluctuating nature of gilt business by entering other related areas, such as underwriting and trading in PSU and corporate bonds and other fee earning business. To begin with, your company has taken some initial steps to enter the markets of CPs, CDS and PSLD Bonds. We are beginning to develop relationship with the issuers and have made some investments in PSLD Bonds both for our own book and for trading. I expect that the Company will make further progress in the area during the remainder of the year. We would like to mention, however, that at present trading and market making in these bonds are also handling of physical papers leading to high operational risks. Our intention, therefore, is to take over such transfer from actively, though, paperless trading is introduced in the debt market within the depository mode as proposed in the last budget speech of the Finance Minister.

ACKNOWLEDGEMENT

I would like to convey my sincere thanks to Reserve Bank of India for their constructive dialogue with, and interest in, the community of Primary Dealers. Without Reserve Bank's support and guidance, the institution of Primary Dealers in India would not have developed the way it has within a period of three years. I would also like to thank commercial and co-operative banks, all India financial and investment institutions and our mutual fund and corporate clients for their business and support. I wish to end on a note of warm appreciation for the commitment and teamwork of the officers and staff of the Company during a difficult and challenging year.

Dalit Assertion and Casteist Retaliation

Edward A Rodrigues

Broken People: Caste Violence against India's Untouchables by Human Rights Watch; New York, 1999; pp 291.

THE 50th year of India's independence has seen scores of evaluations concerning various facets of the nation state and its subjects. In keeping with such a trend, it is both timely and relevant that India's untouchables become the subjects of a critical assessment highlighting not only the dark and gruesome face of civil society in India, but also, the biased and controversial functioning of state institutions in their engagements with India's untouchable population. The report, under review, by Human Rights Watch, an international human rights agency, explicitly aims to provide global visibility for India's dalit population, hopefully with a view to bring external and internal pressure on the Indian state to respect and protect the rights of India's most vulnerable social group. To that extent, this publication would be welcomed by supporters of the human rights movement both in India and abroad. Yet, much of this pressure is being exerted at a time when globalisation is not only heralding the retreat of the state, but also is itself equally a violator of human rights. Global capital is often directly or indirectly responsible for exploitation and marginalisation of many indigenous social groupings the world over. The oppressive and inhuman material conditions in which these social groups survive are often not very much different from that faced by the dalits in India. It remains to be seen to what extent modern states would heed to such international pressures.

Notwithstanding this scepticism, the report itself is a painstaking compilation of evidence based on documentation as well as first hand investigation that would be a useful reading for those involved in the dalit struggles going on in the country. Assessing the dalit situation on a nationwide scale is a difficult task, and even more so, is the job of compressing all this information in some 300 pages. Despite these constraints, the report succeeds in putting together the important facets of atrocities committed against dalits. There is a section on dalit atrocities in Bihar where the struggle over land has pitted the landless dalits against upper castes landed militias like the Ranvir Sena. Likewise, there is a section on dalits in Tamil Nadu where backward castes like the thevars, nadars and vanniya engage in massacres of pallar and adi-dravida dalits. There are also separate sections dealing with dalit labour exposing the various ways in which the dalits are exploited and oppressed; and on dalit women, focusing on their victimisation by ways of assault, rape and even massacre by upper caste men. There

is also an exclusive section on the recent police firing on dalits at Ramabai Ambedkar Nagar, Mumbai. Seen as a whole, these sections of the report read as a succession of detailed and often horrifying accounts of atrocities committed on dalits in the past few years. Even if most of these atrocities have already been publicised by the Indian press and Indian human rights groups, the book does occasion a long hard look at the development of state and civil society in India over the last 50 years. It especially raises the pertinent question of the constitutional legitimacy of the Indian state and its institutions given that so many of them are deeply infested with a feudal and casteist sensibility. As the report starkly reveals, violence against the dalits is rampant and widespread in Indian society, perpetrated by both dominant upper castes and backward castes often with the active complicity of state agencies, not to mention the karmic sensibility of mainstream society. It is not surprising then that a majority of these atrocities go unnoticed and unpunished.

The roots of the variety of atrocities committed against the dalits can be located in the changing material conditions and the refusal of the dalits to accept their traditional lowest position in the caste hierarchy. By asserting their rights for land, minimum wages, control of panchayats, a life of dignity and self respect, etc, the dalits have invoked the wrath of the dominant upper castes who largely control the institutions of state like the police and the judiciary, not to mention the upper caste – upper class nexus that manages India's urban and rural economy. The evidence of atrocities against dalits in Bihar is symptomatic of how India's upper castes engage in a violent reinforcement of the traditional caste hierarchy, with utter disregard for the rule of law. In a variety of situations, the report clearly points out, the upper castes, the police, the judiciary and the state administration are locked in a coalition of interests against the dalits.

In this regard, the report takes a critical look at the role of the Indian state in its constitutional role of protecting the rights of the dalits. Clearly, it is not the absence of laws to protect the untouchables that is a problem. The SC/ST prevention of atrocities act, 1989, combined with various constitutional provisions for protection of women and weaker sections offer ample scope for the state to uphold a just society. Rather, it is the absence of effective implementation of these laws that is a glaring deficiency of the state institutions. The role of the police

in most of the cases has been questionable. Whether it is their active collusion with the upper caste militias, their reluctance to file FIRs when approached by dalit victims, their constant resort to torture of arrested dalits, or their unwarranted firing on dalits – all cast suspicion on the reliability and impartiality of the police in India. The report also mentions the play resorted to by political parties with an anti-dalit agenda to use their mandate to bypass laws protecting dalit rights, as was the case with the Shiv Sena-BJP government in Maharashtra in 1995, when it granted amnesty to offenders in 1,100 cases filed under the SC/ST prevention of Atrocities Act.

In a situation where every conceivable force in the state and civil society is pitted against the dalits, it has been the so-called extremist naxalite groups who have often come to their help by engaging in violent and armed counter offensives against the dominant castes and the police as has been the case in Bihar and Andhra Pradesh. While the report discounts the need for such counter violence, it nevertheless acknowledges that the naxalite outfits are equally victims of a hostile state, often actively supported by armed outfits of the dominant castes. In a situation, as in Bihar, where the constitutional legitimacy and authority of the state has rapidly eroded, it is difficult to imagine the dalits succouring justice by appealing to the state.

In this context, the recommendations made by the Human Rights Watch team are trapped in a fait accompli that would only further the regime of an oppressive state. By suggesting a whole range of committees to be set up at district and national levels that would monitor the effective implementation of the laws to protect dalits and weaker sections, the report is following the liberal logic of western democracy on which its own existence is presumably premised. No amount of committees and sub-committees will help restore the constitutional legitimacy and authority of the state amongst the dalits faced with repression. For the dalits, fight against repression is an ongoing struggle whose fruition will only come when both civil society and the state shed their feudal and casteist sensibility. Such a struggle, it must be acknowledged, cannot be restricted only to the guarantee and protection of 'rights', even if this is an important component of the struggle for dalit emancipation. After all, human rights are themselves a product of material conditions prevalent in a society. Changing these material conditions in their favour is as much an agenda for dalit struggles and despite the misgivings of liberal democracy, violence will play a major role in shaping the contours of these struggles. The state is not an objective and unbiased player in this scenario. In such a situation the role of human rights groups will be called into question, depending on which side of the divide they choose to stand.

From Marrakesh to Seattle

Indian Agriculture in a Globalising World

Ashok Gulati
Rajesh Mehta
Sudha Narayanan

The Agreement on Agriculture (AOA), one of the major agreements signed in Marrakesh under the Uruguay Round in April 1994, has three basic clauses; market access (tariffication), domestic support and export competition. The authors review India's status with regard to each one of these and also try to compare it with what is happening in the rest of the world, especially how the developed countries are adjusting their agricultural policies to make them compatible with the provisions of the AOA. In the light of this analysis, they delineate the broad contours of an agenda for Indian negotiators in the Seattle round with respect to these three clauses, keeping India's interests in mind.

Section II of the paper concentrates on the issue of market access, Section III on domestic support and Section IV on export competition. Section V presents some concluding remarks and also refers to some other important issues that too need to be taken care of in the Seattle round.

I Gearing Up

ONE of the major agreements that was concluded in the Uruguay Round of negotiations signed in Marrakesh in April 1994, was the Agreement on Agriculture (AOA). Since agriculture was being brought under the new rules of world trading system for the first time, it was expected that there would be hiccups in the implementation of this AOA. Accordingly, it was provisioned in the agreement itself that it should be taken up for detailed review before the end of this millennium. Hence, the Seattle meeting in November-end, 1999, will surely have something important to discuss on agriculture. From Marrakesh to Seattle, a great deal has been done in restructuring world trade in goods and services. How well is India prepared for the negotiations expected in Seattle? What are India's interests and options with respect to AOA? And what should India put on the negotiating table with a view to maximise her gains and minimise pains?

There is no doubt that this time India is better prepared for the negotiations than was the case while signing the Uruguay Round Agreement (URA). There has been a debate in the country and the ministry of commerce has also interacted with the industry associations, especially CII, FICCI and ASSOCHAM, and some selected academic institutions, academics and bureaucrats. Unfortunately, none of the farmers' organisations were involved in consultations, nor has any special effort been made to rope in agro-processors and exporters in any meaningful way to chalk out an agenda for negotiations on AOA.

Their representation through industry associations has been rather weak. Nevertheless, one can still put forward a credible agenda for negotiations starting with the Seattle meeting, provided the homework is done well, especially in understanding where Indian agriculture stands vis-a-vis the commitments given under AOA, and also have a good analysis of how the rest of world is adjusting its agriculture to the new set of rules.

This paper is broadly concerned with the 'built-in' agenda encompassed in the AOA. As is well known, [the AOA has three basic clauses: market access (tariffication), domestic support and export competition. We review India's status with regard to each one of these, and also try to compare it with what is happening in the rest of the world, especially how the developed countries are adjusting their agricultural policies to make them compatible with provisions of URA. In the light of this analysis, we also delineate the broad contours of an agenda for Indian negotiators in the Seattle round with respect to these three clauses, keeping India's interests in mind. Accordingly, Section II concentrates on the issue of market access, Section III on domestic support and Section IV on export competition. Section V presents some concluding remarks and also refers to some other important issues that too need to be taken care of in the Seattle round.]

II Tariffication or Market Access

With regard to tariffication (and market access commitment) the AOA entailed conversion of all non-tariff barriers (NTBs)

into equivalent tariff barriers, which was referred to as tariffication. Consequent to tariffication was envisaged a reduction in the base tariff under a time bound programme¹ by 24 per cent over 10 years in the case of developing countries and by 36 per cent over six years for developed countries. The least developed countries were exempt from these reductions. In addition to this, there was also a call to maintain current access opportunities and to establish a minimum access tariff quota, where there was no binding of tariffs. The minimum access tariff quota was to be established at reduced tariff rates for those basic products where minimum access was less than 3 per cent of domestic consumption in the base period 1986-88. Minimum access was to be gradually increased to 5 per cent of base period consumption. Tariff-quotas at reasonable levels were to facilitate access, these tariff quotas would be established on a tariff-line-by-line basis.

In the Uruguay Round, India has agreed to make adjustment in tariff rates for 3373 commodities/commodity groups¹ at 6-digit HS level or commodity sub-groups of 6-digit HS level.² The bound rates for all the commodities are *ad valorem*, except for two commodities (HS codes 080211, 080212) whose bound rates are committed in the form of specific amount in Rs/kg. The committed commodities account for around 65 per cent of India's tariff lines (which are defined at 6-digit HS level).

As far as agricultural lines are concerned, India committed for tariffication 673 lines under AOA at 6-digit, or sub-group of 6-digit, by different chapters (1 to 53) of HS classification. A large number of committed lines belong to commodity groups

like edible vegetables, animal or vegetable fats and oils; meat and edible meat, etc. (Annex Table 1).

To understand the present state of the tariff rates of the commodities committed in the Uruguay Round, the UR bound rates should be compared with the present level of India's tariff rates. As is well known, the government of India (GOI) levies two main types of custom duties on imported goods: basic custom duty (BCD) and additional custom duty (ACD). The GOI's budget for 1999-2000 announced a surcharge of 10 per cent on BCD (SCD). In the budget of 1998-99, a special additional duty (SAD) was announced in addition to earlier announced categories of import duties. The objective of SAD was to offset the sales tax on domestic goods, and the rate was 4 per cent. The standard rates of duty defined in the schedules however do not determine the actual duty rates applicable on different products. The BCD, ACD, SCD, SAD and various exemption notifications issued by the government determine the actual applicable duty rates called the effective duty rates. The exemptions may be use-specific, country-specific, commodity-specific, or value-specific. We have taken into consideration those exemptions, which apply to all items under a tariff heading at 6-digit level of HS code.

Table 1 presents the frequency distribution of the number of UR committed products (or lines), based on the level of difference in India's MFN rates (without taking ACD and SAD) for 1999-2000 and the UR final bound rates. The distribution clearly shows that the present levels of India's MFN tariff rates are significantly lower than that of final bound rates for large number of commodities. Out of 673 products¹ belonging to the agriculture sector considered in our analysis, the present level of MFN tariff rate is significantly less than that of corresponding UR final bound rates. The difference was more than 50 per cent and above, for 82.6 per cent of commodities numbering 556. It reveals that India has not only maintained the UR bound rates, but has unilaterally reduced the MFN tariff rates substantially, compared to the level of UR final bound rates.

Table 2 presents the list of the commodities whose present level of MFN tariff rates is higher than the corresponding UR final bound rates. There are only eight tariff lines, most of which belong to the beverages group, where the MFN tariff rates exceed the UR bound rates. In six of these eight tariff lines, the difference is 80 percentage points, in one it is 20

percentage points and in another (HS 210690 – other food preparations not elsewhere specified), 120 percentage points. In this context, it may be mentioned that the UR final bound rates taken in this paper are the ones which have to be committed by March 2004.⁴

QR Commitments: In the Uruguay Round, it was decided to remove all types of quantitative restrictions (QRs) or prohibitions (other than tariff), whether maintained through quotas or import-export licences. India had also agreed to phase out QRs on all commodities except for around 632 commodities for reasons related to security, religion, etc. (at 8-digit or 10-digit HS level). However, India maintains QRs on import of some more items (around 1482 tariff lines) under provisions of Article XVIII:B of the URA. This article recognises that members whose economies can only support lower standard of living and are in the earlier stage of development may "apply quantitative restrictions for balance of payments position...(and)...shall be free to deviate temporarily from the provisions of the other articles of this Agreement." The provisions relating to BOP also provide that a member has to announce, publicly, time schedules for the elimination of QRs. India presented time schedule of nine years for elimination of QRs. Although it was acceptable to most of developing countries, a number of developed economies had objection to a phased-out period of even seven years. The US, EU, Canada, Australia, New Zealand and Switzerland (and Japan as third party) started the dispute settlement proceedings against India. India reached mutual agreements with all countries except the US. Under this agreement, India agreed to phase-out its QRs over a time schedule of six years period, i.e., 1997-2003. But the US filed a dispute against India. A panel was constituted in November 1997 to examine the US allegation that the continued maintenance of QRs on India's imports was inconsistent with India's obligations under the WTO agreement. In a recent report⁵ of the Appellate Body it is recommended that "India bring its balance-of-payments restrictions, which the Panel found to be inconsistent with Articles XI:1 and XVIII:11 of the GATT 1994, and with Article 4.2 of the Agreement on Agriculture, into conformity with its obligations under these agreements". Government of India is examining this report. It can go for either arbitration or has to remove all the QRs within 15 months, from the date of decision of appellate body (i.e., by the end of 2001).

Keeping the above factor in view, India has no option but to lift QRs under the decision of DSB of WTO by the year 2001. It is worth noting here that India has already offered, unilaterally, trade concessions to members of the South Asian Association of Regional Co-operation (SAARC) by withdrawing QRs on all commodities. Before lifting QRs for countries beyond the SAARC region, India may like to gauge the likely implications of such a move on its BOP position as well as on the domestic economy. It may therefore be useful to see the existing nature of controls on imports of commodities under QRs.

It may be recalled that before the 1990s, India's import policy was quite complex, with different categories of importers, various types of import licences, and myriad ways of importing. A number of concrete steps have been taken during the 1990s to liberalise the import regime. The existing trade policy presents a negative list of commodities, which cannot be imported under open general licence (or free). This negative list basically comprises of three main categories: (i) prohibited, (ii) restricted and (iii) canalised. The prohibited items are tallow, fat, ore, oil of animal origin, wild animal and ivory, etc. A large number of restricted items are consumer goods and their import is allowed against a licence.

To understand the present state of protection by different types of QRs, the import policy of different lines can be further categorised under following groups:

Restricted: OI which

- (1) Consumer goods: items that are permitted to be imported against licence or in accordance with public notice;
- (2) Actual user: imported commodities used by importers;
- (3) Special import licence (SIL): select

TABLE 1: DIFFERENCE IN MFN TARIFF RATES AND UR FINAL BOUND RATES: NUMBER OF LINES BY DIFFERENT RANGE GROUPS

Range (UR-TR)	No of Lines
UR-TR ≥ 75	401
50 ≤ UR-TR < 75	155
25 ≤ UR-TR < 50	29
10 ≤ UR-TR < 25	39
0 ≤ UR-TR < 10	41
UR-TR < 0	8
Total	673

Notes: TR = MFN Tariff Rate (BCD) as announced in GOI, Budget 1999-2000. UR = Uruguay Round final bound rates. (i) Tariff lines at 6-digit HS or sub-groups of 6-digit HS.

(ii) Includes only agricultural products.

Sources: (i) WTO.

(ii) GOI, *Custom Tariff of India, 1999-2000*.

traders (exporters) freely trade these licences in the Indian market. This is certainly a soft type of NTB, because it is easily available (in market), and the importer has to pay a certain premium. The rate of premium has varied from 1.5 per cent to around 3 per cent during the last couple of months.

Canalised, of which the main one is SIL: Based on the export-import policy for the year 1999-2000, only 2114 tariff lines, i.e., about 20 per cent out of 10261 tariff lines, are now subject to any type of NTBs. Out of these total of 2114 lines under NTBs, only about 29 per cent (606 lines) belong to agriculture (HS1-24). However, as a percentage of total agricultural tariff lines (1398) in HS 1-24, those under NTBs (606) comprise 43 per cent, which is quite a sizeable number. But out of these 606 agricultural tariff lines under NTBs, only 344 (56.8 per cent) are under NTBs due to BOP reasons, while the remaining 262 (43.2 per cent) are under NTBs due to reasons related to security, religion, etc. Thus, with the lifting of BOP cover from QRs, it is 344 tariff lines of agriculture that would be thrown open. Table 3 summarises this import policy of all Indian agriculture products (HS 1-24), at 8-digit or 10-digit ITC-HS level for 1999-2000. Of the total 1398 agricultural tariff lines (at 8 or 10 digit ITC-HS classification), 792 lines are totally free. Of the remaining 606 lines, 51 are prohibited, 518 restricted under consumer goods category or SIL, etc., and 37 are canalised. Out of these 37 canalised items, eight can also be imported by acquiring SIL. The list of canalised agencies, which are authorised to import different agriculture products (HS 1-24) is given in Annex Table 2. Table 4 presents the number of agricultural products by four commodity groups (i.e., HS sections I-IV), which are subject to any type of QR due to BOP reasons.

This analysis of Indian import policy reveals that India, leaving aside some of the restrictive tariff lines, has unilaterally gone ahead to reduce tariff barriers much below the bound rates of duty under URA. The biggest agricultural commodities like rice and milk (skimmed milk powder) are already committed at zero import duty. For wheat the bound rate of duty is 100 per cent, but roller flour mills are allowed to import at zero import duty. Similarly, for pulses the bound rate is 100 per cent, but they are being imported under OGL at zero import duty. Edible oils, most of which are bound at 300 per cent import duty, are open for imports at 15 per cent duty. **Tarification Agenda:** Given the above

analysis of present of tariffs, what sort of an agenda with respect to tariffication and market access would serve India's interests?

India, along with other developing countries, should negotiate for more liberal trade environment in the rest of the world too. This alone could ensure easier access to developed country markets, many of which have been highly protected. Accordingly, it seems logical that India should demand

– Abolition of all quotas and quantitative restrictions on imports and exports around the world, except for those countries that have acute BOP problems (as covered under Article XVIII B). In particular, the tariff-quotas that are widely applied by developed countries must be abolished and replaced by equivalent tariffs at the earliest.

– Replacing all specific rates of import duty by rates on *ad valorem* basis.

– Negotiate for ceiling on tariff bindings for any agricultural product at no higher than 50 per cent for any country.

– Negotiate for reduction of tariffs along each tariff line (at HS 6-digit level. This reduction should apply to each tariff line within the HS 6-digit level and not merely to average tariff levels or for product groups as a whole.

– Negotiate for commodities bound at zero tariff (like rice, skimmed milk powder, sorghum, maize, etc) in earlier rounds of GATT to raise it to 50 per cent tariff bindings, as with other agricultural commodities.

The reason India should have this agenda is that the developed world, most notably countries of the European Union and east Asia, are resisting access to agricultural exports of the developing world. They have not gone for full tariffication of agricultural products. Instead, they have

opted for in-tariff quota system for several commodities, which is restricting the potential gains to the developing world. It is well known that several developed countries, including Japan, the US and the European Union, have in place a system of tariff-quotas. The US tariff schedule, for example, includes as many as 192 tariff lines to administer product-specific tariff quotas. Tariff quotas in the US are used particularly in case of beef, dairy products, sugar and some sugar products, peanuts and tobacco and cotton [WTO 1996]. Most countries have agreed to progressive reductions in the over-quota tariff rates; some have also agreed to lower the in-quota rates or raise the concessionary access level. But one is fully aware that quota system is essentially limiting the potential gains to the developing world,

and therefore, abolition of quota systems should be the first item on India's negotiation agenda.

Next, developing countries like India have to be bold and aggressive and suggest a cap on maximum tariff binding at 50 per cent on any agricultural commodity by any nation. Many negotiators in India may be somewhat surprised at this suggestion. They may feel that asking for 300 per cent tariff is a great success in negotiations, but in reality it may not be so. Look at edible oils, India negotiated for 300 per cent tariff binding but its imports are open at 15 per cent. But when countries like India ask for 300 per cent protection, they really lose all the strength in their negotiations with the developed world. How can then one say that a developed country, say Japan, cannot have 700 per cent protection on their rice? And if that is the level of protection accorded to agriculture in the developed countries, where is the potential to gain for the developing world? And that is what the actual situation is for many commodities in developed countries. An example is the dairy sector. For tariff line 40210 (milk powder, granules, etc, fats ≤ 1.5 per cent), in 1998, the peak tariff rate in EU was 99 per cent, in Japan 336 per cent, in Canada 213 per cent, in Korea 211 per cent, as against zero in India. Further, for tariff line 40221 (milk powder, granules, etc, fats ≥ 1.5 per cent, no sugar), in 1998, the peak tariff rate in US was 58 per cent, in EU 171 per cent, in Japan 557 per cent, in Canada 313 per cent, in Korea 211 per cent, as against zero in India for the same year. Further, for the tariff line 40229 (other milk powder, granules, etc), the peak tariff in US was 70 per cent, in EU 199 per cent, in Japan 988 per cent, in Canada 313 per cent, in Korea 211 per cent, as against 35 per cent in India. Similar examples can be found in other commodities as well, especially sugar, and even cereals.

That is why it is suggested that the maximum tariff should not be more than 50 per cent on any tariff line (even at HS 10-digit level) relating to agriculture. This will open up potential for some markets, even in developed countries for goods like milk and milk products, grains, etc. There is reasonably good evidence that Indian agriculture has comparative advantage in most of the products, which often gets blurred due to huge subsidisation of agriculture by the developed countries of east Asia, European Union, and also by Canada and the US [Gulati and Kelley 1999; Gulati and Narayanan 1999].⁶

There is another reason for suggesting a cap at 50 per cent maximum tariff. It is

widely known that the base period for tariffication was 1986-88. During this period world prices in agriculture were quite low. This meant that the tariff equivalent – calculated as the gap between the higher supported internal prices and low world prices – was unusually large. The new tariffs that were based on this large tariff equivalent in 1986-88 offer high protection in other years when the world prices are normal. So the process of tariffication on the basis of 1986-88 prices was really "dirty tariffication" [Hathaway and Ingco 1995]. As a result, gradual reduction in these high tariffs, as agreed under AOA, really slows down the process of opening up on the part of the developed world. Replacing this entire process by a maximum cap of 50 per cent would be in the interest of India and other developing countries.

Another problem in the present agreement on tariffication has been that of uneven tariff cuts across products. Tariff cuts can be undertaken in a way that there is substantial reduction in tariffs of less protected products with negligible cuts in tariffs for the highly protected commodities. The result is continued high border protection for several commodities by many countries. In the European Union, for instance, products like meat, edible offal of animal origin, milk and cream, some cheese, rice, wheat flour and bran continue to carry tariffs of over 120 per cent [WTO 1997]. The tendency to concentrate tariff reductions on products with relatively low protection levels, and to minimise reductions on sensitive items, such as dairy and sugar products, applies to basic and processed products alike. Consequently, the potential gains to a country like India remain elusive. India must, therefore, insist that the 50 per cent cap is on each tariff line at HS 6-digit level is also carried through at HS 10-digit level.

On the issue of renegotiating for zero tariff binding, it may be recalled that under the AOA, India has basically bound its agricultural tariffs at 100 per cent for raw

commodities, 150 per cent for processed agro-commodities and 300 per cent for edible oils. But for a number of commodities,⁷ the binding rates were very low and in a few cases even zero. These were owing to commitments made by India in the earlier rounds of negotiations [Gulati 1998].⁸ Many of these are sensitive products (like skimmed milk powder, rice, two of India's biggest agro-commodities) and it is therefore important that India renegotiates these bound rates to take them to the ceiling of 50 per cent, as suggested for all agricultural products.

To wrap up, India's stand on the issue of tariffication could be twofold. Firstly, India could strive to have the system of tariff quotas and other non-tariff barriers abolished. Such restrictions are inimical to India's export interests and do not do justice to the commitment to increased market access. Secondly, along with complete tariffication, India could argue for rapid reduction in the levels of tariffs (in each tariff line rather than the average tariff levels). It is in India's interest to negotiate for a maximum ceiling on tariff bindings at no more than 50 per cent. This would naturally mean that India would also have to bring down its tariffs to less than 50 per cent on its agricultural imports. This, contrary to popular opinion, should not be any cause for alarm. It is by now a well known fact that Indian agriculture is reasonably efficient and competitive, and would emerge even more so once the domestic support to agriculture in developed countries is reduced/abolished.

III Domestic Support

Also agreed upon was a reduction in domestic support, being quantified through the aggregate measure of support (AMS). Commitments with respect to domestic support are in terms of annual and final bound rates of current total aggregate measure of support specified in the Member's Schedule. The AMS is calculated on a product-specific basis for each

TABLE 4: DIFFERENT TYPES OF QRS, FOR PRODUCTS, STILL MAINTAINED FOR BOP REASONS BY COMMODITY GROUPS (HS SECTIONS I-IV), 1999-2000: NUMBER OF LINES*

(iii) WTO.

basic agricultural product receiving market price support, non-exempt direct payments, or any other subsidy that is not exempted from the reduction commitment ('other non-exempt policies'). Market price support is computed as the gap between a fixed external reference price (based on years 1986-88, it is the average fob unit value in a net exporting country and the average cif unit value in a net importing country, adjusted for quality differences) and the applied administered price multiplied by the quantity of production eligible to receive the applied administered price. Budgetary payments made to maintain this gap, such as buying-in or storage costs are not to be included in the AMS. Non-exempt direct payments which are dependent on a price gap are computed using the difference between the fixed reference price and the applied administered price multiplied by the quantity eligible to receive the administered price. Those non-exempt direct payments that are based on factors other than price are to be estimated using budgetary outlays. Other non-exempt measures like input subsidies, marketing cost reduction measures, etc. are measured using budget outlays. Where this does not reflect the full extent of the subsidy, it is calculated as the gap between the price of the subsidised good or service and its representative market price multiplied by the quantity of the good or service. Support which is non-product specific is totalled into one non-product-specific AMS in total monetary terms.

Subsidies include both budgetary outlays and revenue foregone by governments or their agents. Supports at both national and sub-national levels are included. Specific agricultural levies or fees paid by agricultural producers are deducted from the AMS. For each basic agricultural product, a specific AMS is established expressed in total monetary value terms. The AMS is calculated as close as practicable to the point of first sale of the product concerned. Those measures that are directed at agricultural processors are included to the extent that such measures benefit the producers of the basic agricultural products. The AMS for the base period, calculated in the manner above, constitutes the base level for the implementation of the reduction commitment on domestic support.

A country whose product specific and non-product specific AMS does not exceed 10 per cent of the total value of agricultural product in the case of a developing country (5 per cent for developed countries), is not subject to any reduction

commitments. If, on the other hand, the AMS exceeds the de-minimis level, the country is committed to reduce domestic support: by 13.3 per cent in case of a developing country over 10 years and 20 per cent in case of a developed country over six years. It may be noted that the obligation is on total AMS and within that there is flexibility to choose products covered and extent of support measure and quantity of products that benefit from them.

Ambiguous AMSification: The procedure for estimating AMS is not foolproof. It has a lot of ambiguity.

Should one take the 1986-88 fixed external reference prices even for the years 1995-99? The legal text of the AOA seems to suggest this, but one does not see any economic logic in that calculation when the world prices have dramatically gone up especially during 1995-97 compared to the 1986-88 period. Since the world prices during 1986-88 were quite low, the estimated AMS for that period turned out to be quite high. Reducing that by 20 per cent by developed countries over six years does not really mean anything when world prices during mid-1990s went up. This process sometimes is referred to as "dirty AMSification" [Pursell 1999]. Obviously, the estimates of AMS would differ depending upon whether one uses a fixed (1986-88) external reference price or a varying reference price.

Developing countries like India have another problem in correctly estimating AMS because of the nature of exchange rate regime. During 1986-88, India followed fixed exchange rate system. The official exchange rate was about 15 to 20 per cent below the 'free exchange rate'. And such a situation existed in most of the developing countries suffering from chronic shortage of foreign exchange. Depending upon which exchange rate one uses, the estimates of AMS would differ.

The legal text states that the fixed external reference price is cif if the country is a net importer and fob if it is net exporting. But what if the country was a net importer during 1986-88 but has become a net exporter during 1995-99? Should one keep using the cif price as the relevant reference price, or should one switch to fob price? If one switches to fob price, should it be of 1986-88 fob price or of 1995-99, when that country emerged as net exporter? Further, how sound is the assumption of taking each country as a price-taker in the world market, especially when the country is large?

The AOA also states that the difference between external reference price and

domestic support price should be multiplied by the 'quantity of production eligible for support' to estimate product-specific support. It is well known that in developing countries, a substantial portion of production is used for home consumption. In that case, should one use total production of the commodity as the relevant quantity or the marketed surplus or the quantity actually purchased by the government agency at the support price? Whichever the quantity one chooses to use in the numerator, it is important to keep in mind that the same quantity is used in the denominator, else the estimates of AMS would go haywire.

In case of non-product-specific support, say for fertilisers, the issue is: should one use the budgetary support under the title 'fertiliser subsidy' or estimate it as the difference between external reference price (fixed or variable?) and domestic price paid by the farmers? This is important in India as almost half the fertiliser subsidy shown in the budget is given to fertiliser companies (on flat rate basis or through retention price scheme) to cover their high costs of production compared to the import parity prices [Gulati 1999]. Is the farmer being subsidised or is it the fertiliser industry? Similar problems arise in the case of estimating non-product specific support through power supplies to agriculture, canal irrigation and rural credit. In case of power, for example, it is well known that consumption figures for agriculture sector are worked out on 'residual basis', and that these government estimates overestimate the real consumption by a wide margin, anywhere from 20 per cent to 80 per cent, depending upon the state. In case of canal irrigation, should one take the difference between only the operating and maintenance costs and recoveries or also include amortised capital costs on the cost side? In case of rural credit, should one take only the concession in the interest rates as the relevant subsidy or also include the likely bad debts? Even if in theory one comes to an agreement on these issues, it is difficult to obtain accurate information on many of these in developing countries. So the estimates of AMS can vary widely depending upon what definition of non-product-specific support one uses. The text of AOA seems to suggest using budgetary figures, but strictly speaking, in terms of economic logic, it may not be very correct.

Finally, the AOA (Article 6, para 2) allows for exemption of support (investment subsidies as well as agricultural input subsidies) that are generally given to 'low

income or resource poor producers' in developing countries to encourage agricultural and rural development as an integral part of the overall development programmes. It clearly states that the "domestic support meeting the criteria of this paragraph shall not be required to be included in a member's calculation of its current total AMS". This exemption clause raises a question: who is a 'low income and resource poor producer'? In a country like India, can one say a farmer cultivating less than 10 hectares or 4 hectares or 2 hectares is a resource poor producer? By global income standards, even a farmer with 10 hectares of land and Indian level of yields is perhaps a resource poor farmer.⁹ If this is accepted, 90 per cent of India's non-product specific support should be exempted from AMS calculations. However, even if one takes a very conservative estimate of low income and resource poor farmers in India, all those with 4 hectares or less land would fall in this category. This is the size of the holding in India which can be considered as a minimum break-even size, which is necessary for a farm family to make both ends meet. Even on this conservative basis, almost 60 per cent of the non-product specific support would be exempt from AMS calculations.

The moral of the story is that AMS estimates are quite fragile depending upon the treatment given to the issues raised above. Our efforts to estimate AMS under alternative assumptions reveal that in almost all cases, in most of the years, the product-specific support to Indian agriculture is negative, the range is quite wide from about -10 per cent to -70 per cent. The non-product-specific support is of course positive and varies from about 1 to 10 per cent. If one adds the product-specific and non-product specific supports, as the term 'aggregate' in AMS suggests, then Indian agriculture in most cases is having negative support or 'implicit taxation'. One such estimate worked out on the assumption of import parity basis provides India's AMS in Table 5. Sometimes, this negative product-specific support also raises an issue: should it be treated as negative or zero? New Zealand objected to India's treating negative as negative. New Zealand wanted this to be treated as zero, which in our opinion is not appropriate. The developing countries with large mass of poverty often want to keep prices of agricultural products suppressed with a view to keep food within reach of the masses. But this results in lower incentives to cultivators. This then forces the governments to extend non-product-specific support to farmers. This

is built in the structure of the economy. Therefore there is no logic in counting only the positive and treating the negative as zero, unless the structure undergoes a dramatic change.

'AMSification' Agenda: Given that India's domestic support to agriculture is negative, what could be in India's interest to take to the negotiating table?

- The ceiling for total AMS should be 40 per cent. For each product separately, the ceiling should be 30 per cent in case of product-specific support.

- Reduction commitments on the domestic support ought to not only be on the total AMS but also on each product-specific support separately, as well as on non-product-specific support. India should argue for faster reduction in individual product-specific domestic support than for non-product-specific support.

- For estimation of total AMS, both product-specific and non-product-specific support should be added, which the current agreement states. India must ensure that this is done even if the product-specific support is negative. (There are voices being raised that negative product-specific support should be treated as zero. India must oppose this.)

- With respect to direct payments, a clear distinction has to be made between the Green Box and the Blue Box measures. Green Box measures (support to research and extension, environment, and those on equity grounds, etc) alone should be exempt from reduction commitments. The Blue Box measures, on the other hand, ought to be included in the calculation of AMS and subject to reduction commitments.

- Support/join the Cairns Group in includ-

TABLE 5: AGGREGATE MEASURE OF SUPPORT TO INDIAN AGRICULTURE AS PER CENT OF VALUE OF OUTPUT (SELECTED CROPS)

Year	Product Specific	Non-Product Specific	Total AMS
1986	34.29	2.25	-32.04
1987	-32.08	3.20	-28.88
1988	-35.54	3.32	-32.22
1989	-36.97	3.39	-33.58
1990	-31.78	3.36	-28.42
1991	-62.23	3.60	-58.63
1992	-69.31	3.46	-65.85
1993	-54.75	3.14	-51.61
1994	-43.27	3.40	-39.87
1995	-44.09	3.90	-40.19
1996	-45.84	3.62	-42.22
1997	-32.16	4.12	-28.04
1998(P)	-41.89	3.49	-38.40

Notes: (P) means provisional as it uses some projected values of non-product-specific support due to lack of actual data.

- All figures are expressed as percentage of total value of production of selected commodities in Indian agriculture. Selected commodities include rice, wheat, maize, sorghum, bajra, gram, arhar, soyabean, rapeseed and mustard, groundnut, sunflower and cotton, which comprise roughly about 60 per cent of the value of output in the Indian crop sector. The value of production is computed by multiplying quantity of production by applied administered price - procurement prices or minimum support prices as the case may be.
- Product specific support is computed piecewise as the difference between the applied administered price and a fixed external reference price (of the base period 1986-88) multiplied by the quantity of production. This is aggregated over the products to get total product specific support. For estimating product-specific support fixed external reference prices are cif prices of the selected commodities.
- Non-product-specific support comprises subsidies on inputs like power, irrigation, fertiliser and credit. Power subsidy per unit is the difference between the unit cost of power supplied to the economy and the average tariff for agricultural consumers. Credit subsidy is the amount foregone on account of concessional rate of interest on lending to the agricultural sector. Irrigation subsidy is the difference between operating and maintenance expenses and the total direct receipts of major and medium irrigation works. The fertiliser subsidy is drawn from the budgetary outlays. The non-product-specific support for the selected crops has been assumed to account for 0.45 of the total support of this kind to the agricultural sector (assuming that the crops considered account for 60 per cent of the total value of crop sector output and that the crop sector itself accounts for 75 per cent of the total value of agricultural output - the rest is dairy and livestock). Sixty per cent of this is exempted under the provision of 'low income and resource poor producers'.
- The exchange rate used in the comparison is the official exchange rate until 1992 and the FEDAI rates thereafter.
- Computations are for calendar year. Rabi crop production in a cropping year is included in the following calendar year whereas kharif production for a cropping year is included in the preceding calendar year. The former includes wheat, gram and rapeseed and mustard. All other crops fall in the latter category.

ing the blind box measures in AMS as well as in faster reduction of domestic support and abolition of import restricting quotas. – If there is a question of changing the base period of 1986-88 to some recent period, the period 1996-98 could be taken as the new base for calculations of AMS.

To see the reasons behind the proposed agenda, one should know the level and structure of domestic support in India as well as in other countries. A review of this would automatically reveal why such a bold agenda is being proposed.

As mentioned earlier, and presented in Table 5, despite ambiguity in the estimation of AMS, India's AMS remains negative. The *Trade Policy Review of India* by WTO (1998) also puts its product-specific AMS for 19 commodities in 1995-96 at -38.47 per cent of the value of production [WTO 1998], which is somewhat different than that presented in Table 5 presumably due to differences in commodity coverage. India's non product specific AMS was shown as 7.52 per cent of the total value of agricultural production, which differs from the estimates in Table 5 because the *Trade Policy Review* did not take into account the exemption allowed to 'low income and resource poor producers'. In any case, since the AMS remains less than the 10 per cent *de-minimis* level for developing countries, India has no reduction commitment whatsoever with regard to either total domestic support, product-specific or non-product specific support.

It would therefore be in India's interest to take a stand on the issue of total AMS. Currently, reduction commitments are on total AMS, which implies that a country can offer substantial domestic support to one or more commodities and yet have an overall total AMS that meets the commitment levels. Reduction commitments do not, therefore ensure that domestic support measures are free from trade distorting effects for all commodities. It has been observed for instance, that highly protected commodities like sugar, meat and milk show little or no liberalisation. Oilseeds, fruits and vegetables, which were less protected, were further liberalised [Hathaway and Ingco 1995]. The implication is that for products that have high product-specific AMS, domestic support for that product is still a trade distorting measure. India should therefore press for reduction commitments on product-specific AMS rather total AMS, arguing for a ceiling of 30 per cent on product-specific domestic support.

It is well known that most of the major industrial countries of the OECD pursued

FIGURE 1: DEGREE OF STATE SUPPORT TO AGRICULTURE IN OECD COUNTRIES

costly trade-distorting agricultural support policies right through the decade of the 1980s. The level of support to agriculture increased sharply in 1986 when the Uruguay Round was launched and remained like that until the 1990s [Kelly and McGuirk 1992]. This increasing trend continued until 1995, when the implementation of AOA was to begin. For instance, in 1986-88, the producer subsidy equivalent¹⁰ (PSE) for the OECD countries as a whole was 39 per cent increasing to 41 in 1995. It has been declining ever since. The PSE declined to 34 per cent in 1996, remaining at that level in 1997. When the OECD (excluding Hungary, Poland, Czech Republic, Mexico and Korea) is considered, the PSE level has declined gradually but consistently from 45 per cent in 1986-88 to 35 per cent in 1996 [OECD 1998]. It has remained at 35 per cent in 1997 as well (Figure 1).

Despite declines in protection and support to agriculture, it remains a fact that several developed countries have exceedingly high protection levels. Four broad groups of countries can be identified depending on the extent of protection offered to their agricultural sectors. One group comprises European countries, particularly the countries that belong to the European Union and the European Free Trade Agreement. The European Union has a level of support that is just above the OECD average. The percentage PSE has been significantly below the

1986-88 level only in the last two years. There has been a clear downward trend in market price support, especially since the early 1990s, which can be attributed in roughly equal parts to decreases in producer prices and increases in world prices expressed in ECUs. In 1997, just over half of support was in the form of market price support, as compared to more than three-quarters in 1986-88. Direct payments have increased fourfold and now account for nearly a third of all support. The countries belonging to the European Free Trade Association have among the highest PSEs in the world. The EFTA was established in 1958 with a view to removing tariffs on goods produced in and traded among member states. The current members comprise Iceland, Norway, Switzerland and Liechtenstein. High producer prices in these countries are maintained mainly by import restrictions and deficiency payments related to production.

Another group of countries that heavily protects its agriculture is the east Asian group comprising Japan, South Korea and Taiwan among others. These countries are essentially net importers of agricultural produce. Although there has been liberalisation in some agricultural products in Japan, basic food products continue to be highly protected. In fact agricultural transfers accounted for a greater proportion of GDP than that of agricultural GDP itself. The percentage of agricultural GDP to total GDP was 1.4 percent

in 1995 (provisional), while, estimated share of transfers in total GDP was higher at 1.8 per cent [WTO 1998]. Protection has merely encouraged inefficient farms. Unlike other major trading countries in Japan there is no discussion of fundamental reforms for the major commodities through steps to integrate Japanese agriculture with the world market. Liberalisation had been restricted by 1990 to beef (which has been tariffed), apple juice, processed dairy products and other minor products. Japan's PSE has fluctuated for most of the period since 1986-88, but has shown declines in 1996 and 1997. The average producer price has developed along a slow downward path and in 1997 was 10 per cent below its 1986-88 level. Around 85 per cent of support is market price support, and this share has been remarkably stable over the years.

Yet another group of countries are those like the US, the Visegrad countries (the Czech Republic, Hungary and Poland) and Canada, that have succeeded in reducing previously high PSEs (Canada, of course does protect certain sectors significantly). In the US, for instance, the PSE has fallen by almost half since 1986-88. Recent developments have been marked by the shift from set-aside and deficiency payments for crops to degressive direct income payments. In 1997, domestic prices were on an average 9 per cent above the world market level. Input subsidies have declined over the last decade, while expenditures on general services and sub-national expenditures have increased. Canada is a net exporter of agricultural produce and is pro-reform. However Canada, which is also a major importer, has a high PSE and has in place an extensive income support system for its heavily protected domestically oriented agricultural sector. Its protection to import competing products is particularly noteworthy. Despite this, Canada has striven to bring down its protection levels. This is reflected in the decline in its PSEs particularly after 1994. The downward trend in Canada's PSE was further accentuated in 1997, as the compensation payments granted for the removal of the grain transportation programme came to an end. Canada's 1997 percentage PSE is less than half that of 1986-88. The share of direct payments in total support has varied between 10 and 30 per cent over the last decade, reflecting a previous practice by the Canadian government to resort to 'ad hoc' payments and temporary payment schemes. Expenditures by provincial governments account for a quarter of the PSE.

The fourth group of countries consists of members of the net food-exporting countries of the Cairns Group.¹¹ These countries, particularly Australia and New Zealand, have very low protection levels and strongly advocate free trade. New Zealand, with a PSE of 3 per cent, provides the lowest level of support of all the OECD countries. Moreover, support has been at the same low level since 1991. More than half of the support is in the form of budget-financed general services and the remainder is from market price support resulting from sanitary import restrictions for poultry and eggs. There is close alignment between domestic and world prices. In Australia, the PSE is the second lowest in the OECD area in 1997 – it has seen a gradual decline starting in the late 1980s and into the 1990s, particularly after 1995. Australia has liberalised most of its agricultural sector. Controls on wheat marketing and sugar imports have been lifted. The composition of Australia's support to agriculture has changed little in the long run. Less than half of Australia's PSE is from market price support, the remainder being provided in the form of input subsidies and expenditures on infrastructure and general services. More than one-third of support is provided at the sub-national level.

This review clearly shows that it is important for India to seek reduction in high domestic support by the developed countries most notably the European and the east Asian countries.

Another important issue that India must raise in the forthcoming negotiations is that of the 'Blue Box' measures. Part XIII of Annex 2 of the AOA details the basis for exemption of a prescribed list of measures from reduction commitments. The exemptions are of two kinds: those that are referred to as the Green Box measures and those that are called the Blue Box measures.

The Green Box measures essentially involve measures of the nature of funding for research, pest and disease control, training services, extension and advisory services, etc, payments under environmental programmes, payments under regional assistance programmes limited to producers in disadvantaged regions, payments (made either directly or by way of government financial participation in crop insurance schemes) for relief from natural disasters and similar forms of support.

The Blue Box measures refer to direct payments to producers like decoupled income support; payments not linked to production, structural adjustment assistance provided through investment aids to

compensate for the structural disadvantage, through resource retirement programmes, through producer retirement programmes, government financial participation in income insurance and income safety-net programmes. These shall relate solely to income and not to either the level of production or to prices, domestic or international.

Such a wide range of support measures that are exempt from reduction commitments thus offers enormous possibilities for member countries to alter their domestic support structure in a manner where there is apparent reduction in domestic support as measured by the AMS but a corresponding increase in exempt measures like direct payments of the sort mentioned above.

This is evident from the domestic support composition of the OECD countries (Figures 2a-2c). Market price support was the overwhelming form of support in 1997 as it was in 1986-88 followed by direct payments and other forms of support. There has, however been a significant change in magnitudes. For the OECD overall, market price support accounted for 85 per cent of all assistance. By 1997, its share was only 62 per cent. In contrast to the trend in market price support, significantly, direct payments have been growing in importance. This essentially implies that market price support is being increasingly substituted for by direct payments.

Of the four groups of nations discussed above, it is the European Group of countries (the EU and the EFTA) that have marked movements towards direct payments. Declines in share of market price support have been matched by concomitant increase in the share of direct payments. In the practice of carrying out reforms, these countries have reduced support policies in terms of input subsidies and system of administered prices, but maintained support to agricultural producers through increased direct payments in forms that are exempt from reduction commitments. In 1997, nearly half of the OECD countries continued to increase their direct payments in national currency terms (either through larger allocations for existing programmes or by introducing new payment measures). This was in spite of a general tightening of budgets [OECD 1998]. The growing use of direct payments supposedly represents a shift away from production-linked and towards direct income payments in providing support to farmers. While direct payment measures have improved market orientation to the extent that there is a decline in output-related price support,

they have not always reduced the dependency of the agricultural sector on support. What these Blue Box payments do is to cover the fixed costs of the farmer, leaving him to bear only the variable cost. This makes even the most inefficient farmers competitive. Thus, although in terms of resource allocation, these programmes are supposed to achieve dissociation from production and weaken the policy incentive to increase agricultural production at the margin, they end up encouraging the farmers in the industry. Increased production results in these countries exporting more at lower prices harming other competitors who may be more efficient producers of a commodity.

The fact that several European economies, notably the EFTA countries and the European Union, are disguising trade-distorting domestic support under the Blue Box canopy, therefore, is an issue that India must put forth in strong terms.

IV Export Competition

In the area of export competition, export subsidies were subject to reduction commitments although several kinds of direct payments were exempted. The export subsidy commitment is either in the form of budgetary outlay reduction commitments or in the form of export quantity reduction commitments. The budgetary outlays and the quantities benefiting from such subsidies at the conclusion of the implementation period are no greater than 64 per cent and 79 per cent of the 1986-90 base period levels respectively. For developing countries, these percentages are 76 per cent and 86 per cent respectively.

Direct export subsidies are to be reduced by 36 per cent below the 1986-88 level in the case of developed countries over the implementation period of six years. The quantity of subsidised exports by the developed countries is to be reduced by 21 per cent in this period. For the developing countries, commitments involve a reduction of direct export subsidies by 24 per cent and quantity of subsidised exports by 14 per cent. This is to take place within the span of 10 years. The least developed countries, as before, are not subject to any reduction commitments.

The implications of export subsidies for India are easy to see. It restricts the ability of India's exports to compete with those originating in developed countries. It would therefore be in India's interest to demand: - complete wiping out of export subsidies by the developed countries, especially the European Union (the dairy sector in par-

FIGURE 2A: COMPOSITION OF SUPPORT IN OECD COUNTRIES, BASE PERIOD 1986-88

FIGURE 2B: COMPOSITION OF SUPPORT IN OECD COUNTRIES, INTERMEDIATE PERIOD 1992-94

FIGURE 2C: COMPOSITION OF SUPPORT IN OECD COUNTRIES, 1997 (ESTIMATES)

Note: Feed Adjustment is the value of market price support for coarse grains, oilseeds and taxes on processed feedstuffs used in animal feed. To avoid double counting this is subtracted from PSE of livestock products. Hence the negative sign.

ticular) and eastern Europe;

– If India fails in achieving this end, then it should press for line-by-line reduction commitment on export subsidies. At present, the chief drawback of the rules on export subsidy is that commitments are defined over commodity aggregates rather than individual lines.

The export subsidies in the AOA (Part V, Article 9) that are subject to reduction commitments include direct subsidies to agricultural producers contingent on export performance; subsidies on agricultural products contingent on their incorporation in exported products; provision on favourable terms of internal transport and freight charges on export shipments (developing countries are exempt from commitments on this form of subsidy provided that it is not used to circumvent reduction commitments), subsidies to reduce the cost of marketing exports of agricultural products excluding export promotion and advisory services (here again, developing countries are conditionally exempt from reduction commitments); sale or disposal for export of non-commercial stocks of agricultural products by the government or its agencies at a price lower than the comparable price charged for a like product by buyers in the domestic market; and payments on the export of an agricultural product that are financed by virtue of governmental action whether or not a charge on the public account is involved, including payments that are financed from the proceeds of a levy imposed on the agricultural product concerned or on an agricultural product from which the exported product is derived.

Export subsidies not listed above (including export credits, export credit guarantees or insurance programmes) can be used, but not in a manner that results in or threatens to lead to circumvention of reduction commitments nor may non-commercial transactions be used to circumvent such commitments.

As far as India is concerned, agricultural exporters in India do not get any direct export subsidies. India provides income tax exemptions for profits from agricultural exports under Section 111C of the Income Tax Act. Apart from this there are subsidies on costs of freight on export shipments of floriculture exports as also of vegetables and fruits. Since these payments are exempt from reduction commitments for developing countries, India is not required to reduce these subsidies. India has however capped its export subsidies and is required to notify the WTO on its direct export subsidies once in two years.

India's concerns lie elsewhere, namely, the high level of export subsidisation by some of the developed countries. In the period 1986-90, the world's top five users of export subsidies for any given major product account for almost the total of such subsidy in the world and for almost all commitments for reduction. For example, of the total export subsidies on wheat in the world, the share of the top five countries (the US, the European Union, Canada, Turkey and Hungary) was 95 per cent. For rice the figure was 100 per cent and the countries subsidising their rice exports most were Indonesia, the European Union, Uruguay, the US and Colombia. For most of the products, the European Union is the largest user of export subsidies particularly for sugar and dairy [Hathaway and Ingco 1995].

Today, despite reduction commitments on export subsidies, several developed countries continue to make extensive use of export subsidies as in the past. Even though the high world prices during the past few years have made the export subsidy limits less constraining, especially for grains, a number of countries reached their permitted subsidy limits for certain commodities in 1997. In some cases, unused subsidy allowances carried over from previous years were used to allow subsidised exports in excess of the annual limit. Although the agreement does permit carry-over, it could reduce the effect of the discipline over the implementation period.

The European Union reached the volume (but not the budgetary) limits for subsidised exports of cheese, was close to the limit for beef, but remained well under the limits for butter and skimmed milk powder. Between 1996 and 1997 export refunds for were reduced by 23 per cent for processed cheese and by between 14 and 45 per cent for other types of cheese [OECD 1998]. But refunds for butter were increased by 18.8 per cent, 16.7 per cent for skimmed milk powder and 4.6 per cent for the whole-milk powder. Since August 1997 however export refunds for all dairy products were reduced by 5 per cent. Export subsidy allowances for some commodities were carried over from previous years, particularly for beef. As a result of lower world prices, the EU re-instated export subsidies for grains. In the US, no export subsidies were paid for crops, but those for dairy products increased sharply. Export subsidies have been less important for processed than for basic agricultural products in the past. The export subsidy commitments under the URA constrain exports of certain food products containing

subsidised agricultural raw materials, such as those incorporating dairy components, sugar and cereals. Some countries have also resorted to greater use of arrangements allowing duty-free entry of agricultural raw materials for processing if the final products are re-exported [OECD 1998].

V Concluding Remarks

What does all this review of the three basic clauses of AOA tell us in terms of a possible negotiating strategy for India during the Seattle round?

First, as a negotiating strategy for AOA, India should start from a position of strength as it is not distorting its agriculture to the extent the developed world is.

ANNEX TABLE 1: TARIFF COMMITMENT BY INDIA IN URUGUAY ROUND FOR AGRICULTURE SECTOR, BY DIFFERENT CHAPTERS OF HS CLASSIFICATION; NUMBER OF LINES

Ch No	Description	Number of Lines
1	Live animals	15
2	Meat and edible meat offal	50
4	Dairy produce, birds' eggs; honey;	25
5	Products of animal origin	17
6	Live trees and other plants	13
7	Edible vegetables	57
8	Edible fruit and nuts; peel of citrus	50
9	Coffee, tea, mate and spices	33
10	Cereals	17
11	Products of the milling industries	34
12	Oil seeds and oleaginous fruits	44
13	Lac; gums, resins and other vegetables	12
14	Vegetable plaiting materials;	11
15	Animal or veg fats and oils	51
16	Preparations of meat, fish	16
17	Sugar and sugar confectionery	15
18	Cocoa and cocoa preparation	11
19	Prep of cereals, starch, milk	16
20	Prep of veg, fruit, nut, etc	45
21	Miscellaneous edible prep	15
22	Beverages, spirits and vinegar	21
23	Residues and wastes from food	24
24	Tobacco and manuf substitutes	9
29	Organic chemicals	2
33	Essential oil and resinoids	14
35	Albuminoidal substances	8
38	Miscellaneous chemical products	2
41	Raw hides and skins and leather	12
43	Furskins and artificial fur	9
50	Silk	4
51	Wool, fine or coarse animal hair	10
52	Cotton	5
53	Other veg textile fibres	6
	Total	673

Notes: (i) Tariff lines at 6-digit HS. There were two lines which are defined as sub-groups of 6-digit HS.
(ii) Includes only agricultural products.
(iii) Based on final bound rates committed at the UR.

Sources: (i) WTO.
(ii) *Custom Tariff of India, 1999-2000*, GOI.

Its agriculture is reasonably efficient in the global context, and if it could streamline its domestic policies it has the potential to gain from the emerging world scenario. In terms of negotiating stand, India must demand removal of all distortions in agricultural policies ranging from quotas to domestic support, not at product aggregate levels but at product-specific levels of ITC-HS 10-digit classification. This would expose the extremely high levels of protection on certain commodities accorded by the developed countries. The major thrust of tariffication or AMSific-

ation agenda should be to move from product aggregates to product-specifics.

Second, in terms of India's allies, it appears that India's interests would be closer to the overall interests of the Cairns group, and the ones that are in line with the basic spirit behind the WTO rules. From India's standpoint, therefore, it would pay her to support/join the Cairns group in this regard. It is interesting to see that the Indian sugar industry has seen this as an opportunity. Without the formal backing of the government, it also declared that they would join hands with the members

of the Cairns group in demanding abolition of sugar quotas as well as subsidies being given in the developed countries ('Sugar Industry Joins Free Market Lobby', *Economic Times*, June 9, 1999). It is for the first time that any industry has taken an independent stand in the context of negotiations. The sugar industry hopes that with the Cairns group as a formidable fourth power (after the US and the European Union), it can succeed in securing provisions that would unshackle and open up sugar markets in developed countries (the US and the EU, in particular). Similar views have been expressed by the Indian dairy industry through industry associations. These are steps in the right direction and it is to India's benefit to align with the Cairns group and through greater bargaining power demand genuine liberalisation of agricultural markets.

Notes

[The views expressed in this paper are the authors' and not of the institutions they belong to.]

- 1 There is a one commodity group where the commitment is offered for a sub-group of HS 4-digit level.
- 2 Tariff rates for India are defined at 6-digit HS level.
- 3 In our analysis we could not consider a few commodities in our analysis as the definition of HS code at 6-digit level has changed from pre-UR round period to post-UR period.
- 4 This analysis is based on India's BCD. If 10 per cent surcharge (SCD) is also included in MFN tariff rates, the frequency distribution of (tariff rate-bound rate) will not change significantly.
- 5 WTO, 'India-Quantitative Restrictions on Imports of Agricultural, Textile, and Industrial Products: Report of the Appellate Body', WT/DS90/AB/R, August 23, 1999.
- 6 If one has any doubts on this, just look at the domestic prices in some of these countries at the beginning of URA. In South Korea, in 1995, the domestic prices for soybeans reigned at 720 per cent higher than the world prices. For barley, the figure was 419 per cent; maize and beef prices within Korea were 343 per cent and 309 per cent of the world prices and for rice the figure was 286 per cent [WTO 1997]. Some countries, notably EU, have started reducing the domestic support prices compared to world prices, but funneling subsidies through the 'blue box'. More on this is taken up in the section on domestic support.
- 7 The products for which tariffs are bound at 0 per cent are milk (in powder, granules or other solid forms, of a fat content, by weight, not exceeding 1.5 per cent), milk (not containing added sugar or other sweetening matter), spelt wheat, rice (in the husk, paddy or rough, husked-brown, semi-milled or wholly milled, broken), grain sorghum and millet.
- 8 Zero tariff bindings for some commodities like rice, plums, fresh grapes, and dried skimmed milk were committed in 1947 (Geneva Protocol, 1947); maize, millet, spelt were bound at zero at the Torquay Protocol,

ANNEX TABLE 2: INDIA: LIST OF ITEMS¹ UNDER CANALISED IMPORT: 1999-2000

Sl No	Exim Code	Description	Importing Agency
1	090610 01	Cassia	STCL and NAFED

1951; sorghum at the Geneva Protocol in the Dillon Round, 1962.

9 The average yield of foodgrains in India, which dominate the Indian cropping patterns, is less than 2 tonnes per hectare. Assuming the average yield to be 2 tonnes, and an average price of Rs 5,500 per tonne in 1999-2000, and out of pocket expenses at about 50 per cent of the gross revenue, the net income per hectare turns out to be Rs 5,500. Given a crop intensity of 1.3, a 10 hectare plot can get an annual net income of Rs 71,500 (Rs 5,500 × 1.3 × 10 = Rs 71,500). Given an average family size of at least five in rural areas, this translates to a per capita income of Rs 14,300 or just US \$329 at the rate of Rs 43.5 to a US\$.

10 Producer subsidy equivalents (PSEs) are aggregate measures of support - they summarise the effects of different forms of governmental programmes and intervention in a single number. This method is superior to other tools like nominal or effective rates of protection since these often account for only a small proportion of the transfers between the government and the producers of agricultural commodities.

Symbolically, PSE can be defined as:

$$\text{percentage PSE} = \frac{\text{Total transfers/Value to producers}}{(Q * (P_d - P_w * X) + D + I) / (Q * P_d + D)}$$

Q is the quantity produced,

P_d is the producer price in domestic currency units,

P_w is the world price in world currency units,

X is an exchange conversion factor,

D is direct government payments, and I is indirect transfers through policies such as input subsidies, marketing assistance and exchange rate distortions.

11 The Cairns group consists of 14 developing and developed countries including Australia, New Zealand, Argentina, Brazil, Chile, Colombia, Uruguay, Malaysia, Indonesia, Thailand, Philippines, Fiji, Hungary and Canada.

DEMOCRACY WITHOUT ASSOCIATIONS

Transformation of the Party System and Social Cleavages in India
PRADEEP K CHHIBBER

The Indian party system, which had been dominated since 1947 by the catchall Congress Party, underwent a dramatic change during the 1996 and 1998 elections. For the first time, the Indian party system split along regional, caste and religious lines. In telling this story, Pradeep Chhibber adds a vital and neglected dimension to debates in comparative politics about state-society relations - namely, the nature of the party system. Rejecting explanations of political parties as being mere products of either state policies or social cleavages, Professor Chhibber places parties within the framework of state institutions and associational life.

DEMOCRACY AND SOCIAL CHANGE IN INDIA

A Cross-Sectional Analysis of the National Electorate
SUBRATA K MITRA and V B SINGH

This book explains the resilience of Indian democracy in the face of challenges posed by modernisation and accelerated social change coupled with problems such as poverty, illiteracy, and religious and linguistic heterogeneity. The authors substantiate their views by drawing on a nation-wide survey conducted in 1996 in which over 10,000 Indian voters, representing a cross-section of the country's electorate, were interviewed. The result is this insightful account of how India's citizens evaluate the structure and process of Indian democracy.

Is Poverty Now a Permanent Phenomenon in Pakistan?

S Akbar Zaidi

Around mid-1990s, there was growing awareness and recognition that after two decades of poverty reduction, these positive trends had either slowed down, or worse still, had been reversed. Many studies which analysed and explained these trends, argued that poverty in Pakistan had been reduced due to a combination of factors, including high and sustained growth over a fairly long period of time, by the role and contribution made by remittances from the West Asia, and by a public policy which was not so much focused upon poverty alleviation per se, but dependent more on overall government spending. Since 1988, when the government started following an IMF and World Bank structural adjustment programme, almost every single macro-economic indicator with some poverty reducing impact, began to worsen. Over the last decade, growth has slowed down markedly, development and social sector spending has been slashed, inflation has increased, manufacturing sector growth has been exceptionally low, and remittances have fallen to their lowest levels in 20 years. Hence, all the factors which may have had a positive influence on poverty alleviation, have deteriorated, possibly explaining why poverty returned to Pakistan and why it has continued to persist. With every government committed to such a stabilisation and restructuring programme, and with its own poor record of targeting for poverty alleviation, it is more than likely that poverty in Pakistan is going to grow and persist well into the future.

TOWARDS the mid and late 1980s, there was ample evidence which confirmed the perception that poverty had been falling in Pakistan continuously, for almost two decades, often at times quite dramatically. However, towards the very beginning of the 1990s, some concerns emerged which suggested that perhaps that the decline had slowed down, or had even been reversed. The question raised by researchers then, in the middle of the mid-1990s was, whether poverty had returned to Pakistan, a question which was answered in the affirmative by wide recognition and consensus, that poverty was on the increase, although data was still lacking to make definite and precise claims.¹ Later, the availability of data and interpretations and analysis of macroeconomic trends substantiated those earlier claims. Based on those trends, at the end of the 1990s, there is a feeling that poverty has continued to persist in Pakistan, and in fact, may have worsened considerably since the mid-1980s. The question which now needs to be asked is whether poverty has become a permanent feature of Pakistan's economic and social reality, and whether it is here to stay, notwithstanding attempts at poverty alleviation.

This paper hopes to answer the question posed as the title of the paper, based on a review of trends regarding poverty incidence over the last three decades. Its emphasis will be on an examination of the reasons why income poverty fell in the 1970s and 1980s, and why it began to rise in the 1990s. If we can explain and

understand the reasons for both trends, it would be helpful in answering our question, which is the main purpose of this investigation. At the outset, it is important to clarify the scope of this paper and, more importantly, to emphasise the areas it does not cover. This paper does not present a review of literature in the conventional sense, identifying previous studies which have looked at some of the many aspects of poverty in Pakistan, simply because there have been a couple of excellent and detailed recent reviews which do precisely this.² Nor does the paper make any comment on the nature of methodology employed in estimating poverty lines and trends, and nor does it get into the process of estimating and presenting new numbers about poverty in Pakistan.³ A rural/urban, provincial/regional distribution is also not considered for the purposes of this study.⁴

This paper looks at the broad trends that have emerged in the incidence of poverty over the last 50 years, attempting an explanation of these trends.⁵ In particular, it looks in far greater detail at the three or four years in the mid-1980s when poverty fell very sharply and gives reasons for this fall. This period is contrasted with that of more recent years, when poverty is supposed to have risen almost as dramatically as it fell. This contrast and explanation helps in understanding whether poverty reduction in Pakistan took place under special conditions and whether those conditions are likely to be replicated. In addition, the paper discusses the current nature and causes of poverty in Pakistan,

and a critical evaluation of government policies in redressing these poverty trends is also undertaken. Finally, in light of the causes by which poverty fell and current efforts at poverty alleviation, we attempt an answer to the question raised earlier, viz, is poverty now a permanent phenomenon in Pakistan?

TRENDS IN POVERTY

Most of the studies which estimate trends in poverty levels and poverty incidence in Pakistan use a headcount measure under an arbitrarily defined poverty line. The poverty line itself is usually based upon the concept of consumption poverty, where a minimum daily recommended calorie allowance determines that poverty line.⁶ While comparison between different sets of figures derived by different scholars is quite problematic, this has been the norm for most comparisons.⁷ Table 1 presents a number of sets of estimates of the extent of poverty across time estimated by different studies.

The percentages presented in Table 1, and the numbers that they reveal, are in themselves critically important especially when the government of Pakistan does acknowledge the fact that in 1998-99, there are at least 36 million people or 6 million households that fall below the poverty line [GoP 1992:2]. For the moment, however, let us examine the trends in poverty incidence rather than the scale and magnitude of the incidence of poverty in Pakistan.⁸ The table confirms the view that poverty first rose in the 1960s, after

which it has seen a continuous decline until around 1987-88, after which, for the most part, there has been another rise in the incidence of poverty in the country. Gazdar, Howes and Zaidi (1994) study which was one of the background papers on which the influential World Bank's *Pakistan Poverty Assessment* report [World Bank 1995] was based, and the recently produced MHCHD/UNDP study, however show that the declining trend in poverty was seen to continue, albeit at a slower pace, into the 1990s. Nevertheless, the problems of data and measurement notwithstanding, almost all of the recent literature on poverty in Pakistan seems to suggest that there is a growing 'consensus' that poverty has increased since the early, and most certainly, since the late, 1990s [Zaidi 1999a for recent literature]. However, there is almost complete agreement that there was a formidable decline in poverty in the period 1969-70 to 1979, a drop of almost 16 percentage points over the decade, and an equally impressive fall of 13 percentage points in the next decade, until 1987-88. Moreover, in the 1980s, the period 1984-85 to 1987-88 shows a drop in poverty by more than 7 percentage points using panel 1A from Table 1, and almost 9 points as seen in panel 1C.

Another noticeable trend from Table 1 is the more or less consistent fall in urban poverty throughout the last 36 years. Although only 23 per cent of the population lived in cities in the early 1960s compared to almost 40 per cent today, this decline in urban poverty has continued even when there was a rise in rural (hence, overall) poverty. However, the dramatic fall in poverty in the 1970s was attributed to the huge reductions in rural poverty which accounted for a much larger proportion of the population and of the poor. The data from panel 1B, in fact, shows that poverty in urban areas in the mid-1990s, had virtually been eliminated.¹⁰

If we examine trends in income distribution, we observe that during the 1960s when there was high growth and poverty increased, the Gini coefficient fell from 0.355 to 0.33 improving the distribution of income for both urban and rural areas (Table 2). In the 1970s, there was again an inverse relationship between poverty and income distribution, with the latter improving and the former worsening. Both the 1980s and the 1990s saw poverty and income distribution moving in the same direction, with poverty falling in the 1980s and income distribution improving; the decade of the 1990s had the opposite trends. Currently, income distribution based on the Gini coefficient is worse than what it

was in the early 1960s [MHCHD/UNDP 1999:85].

EXPLAINING THE TRENDS IN POVERTY, 1960-88

In much of the literature that has examined poverty trends in Pakistan, a key concern has been with the relationship between economic growth and poverty. Although most authors have argued and cautioned that there are no hard and fast rules which reveal an automatic, strong correlation, poverty is seen to be closely linked to, if not determined by, economic growth. In fact, economic growth is considered to be an essential prerequisite for poverty reduction. Almost every study examining the relationship of economic growth on poverty alleviation has argued that 'economic growth is the foundation on which poverty reduction can be achieved' [World Bank 1995:iii] and that 'economic growth plays a dominant role in poverty alleviation and without strong and sustained economic growth poverty alleviation is not possible' [GoP 1998b:4]. A broad trend in the incidence of poverty can be gauged from Table 3, where trends in economic growth and poverty are presented over the last five decades. The table suggests, perhaps, that for the 1960s and 1970s, growth and poverty did not seem to have the 'correct' relationship, and only in the 1980s and 1990s, did both move in the right, inverse direction. This important theme is developed later in this paper, where the focus shifts from merely looking at growth, to emphasising the context, nature and impact of growth.

Although urban poverty declined in the 1960s, it was a considerable rise in rural poverty which resulted in an overall increase in poverty during Pakistan's development decade. In one of the very few papers that explain and analyse (rather than merely document) poverty in the 1960s, Irfan and Amjad (1984), provide an explanation for the rise in rural poverty. The authors' main argument is that the reason for high levels for poverty in the 1960s well into the 1970s is to be found in the significant changes in the agrarian structure, especially the size distribution of holdings which were said to have had important repercussions for the rural occupational distribution of households. New technology was a key factor, which allowed large landowners to resume land previously rented-out for self-cultivation. Tenant farmers were hence evicted, and had either to operate smaller landholdings, or then join the ranks of the landless labourers. Although there was greater agricultural growth on account of

technological innovation, at the same time, the conditions of those evicted did probably deteriorate. Increased mechanisation led to a decrease in demand for labour which may have been one of the key reasons for the increase in poverty despite high growth in output.

TABLE 1: TRENDS IN POVERTY

Year	Total	Rural	Urban
1 A Proportion of poor (headcount per cent)			
1963-64	40.24	38.94	44.53
1966-67	44.50	45.62	40.96
1969-70	46.53	49.11	38.76
1979	30.68	32.51	25.94
1984-85	24.47	25.87	21.17
1987-88	17.32	18.32	14.99
1990-91	22.11	23.59	18.64
1992-93	22.40	23.35	15.50
1998-99	26.0	NA	NA
1B Incidence of poverty (per cent)			
1975	35.5	49.8	19.0
1980	27.7	36.2	11.8
1985	9.4	15.2	7.4
1990	12.4	19.0	4.8
1995	14.7	23.1	2.6
1C Proportion of poor (headcount per cent)			
1984-85	46.0	49.3	38.2
1987-88	37.4	40.2	30.7
1990-91	34.0	36.9	28.0
1D Proportion of poor (headcount per cent)			
1986-87	26.9	29.4	24.5
1987-88	26.4	29.9	22.7
1990-91	23.3	26.2	18.0
1992-93	20.3	22.5	16.8
1993-94	20.8	24.4	15.2

Source: 1A: Amjad and Kemal (1997), except for the year 1998-99, which is an estimate by the Planning Commission, Government of Pakistan (1999), which uses the same table as the original in Amjad and Kemal (1997)⁹ 1B: Social Policy and Development Centre (1998), 1C: Gazdar, Howes, and Zaidi (1994); 1D: MHCHD/UNDP (1999).

TABLE 2: TRENDS IN THE GINI COEFFICIENT

Year	Gini Coefficient		
	Total	Rural	Urban
1963-64	0.355	0.348	0.368
1966-67	0.351	0.314	0.388
1968-69	0.328	0.293	0.370

1992-93	0.390	0.367	0.384

Source: MHCHD/UNDP (1999: 85).

Growth rates for GDP, agriculture, and manufacturing in the 1960s were two or three times those of the 1950s, and substantial structural changes were made in the economy in this decade. A GDP growth rate of almost 7 per cent for a decade and nearly 10 per cent for manufacturing (Table 4) were probably responsible for the fall in urban poverty during the 1960s. The mode of production and relations of production were dramatically transformed in this decade, and although agricultural growth rose substantially, it was the manufacturing sector which was responsible for the high growth rates in the economy and for the lowering of urban poverty.¹¹

While growth, particularly in the manufacturing sector, may have been the main cause for the reduction in poverty in urban areas in the 1960s, the reasons for the fall in poverty in the 1970s are less directly related with growth, and hence are far more interesting and instructive, particularly when we later consider the more recent trends in poverty and their explanations. The 1970s, mainly due to political factors, were the only years in the history of Pakistan, when the issues of poverty and economic equality were prominent [Gazdar 1998:8; Burki 1995:3].

The much derided nationalisation programme of the PPP government of 1972-77 may have been a key factor that provided and ensured employment guarantees to a vocal, predominantly urban, population. Public sector employment 'soared' [Gazdar 1998:3] and the share of the social sectors in development plans increased substantially. In fact, when the PPP government was removed in 1977, development expenditure in 1976-77 was an extraordinary 11 per cent of GDP, the highest ever in Pakistan's 52-year history [Tahir 1999:112]. Because of its political orientation, a number of important changes were enforced in the economic and social structure in Pakistan during the 1972-77 period, many having a positive impact on poverty reduction, but perhaps not an immediate impact on economic growth.¹²

A number of policies which may have had an impact on poverty reducing measures included land reforms implemented in 1972; the nationalisation of banks which resulted in a growth of the number of branches by 45 per cent in five years, resulting in an 11-fold expansion in credit to agriculture, with the network reaching even far flung remote rural areas. As Tahir writes, 'for the first time, credit was also directed towards small farmers, businesses and industries and low-cost housing through mandatory targets for

the banks' [Tahir 1999:109]. Self-employment and the small scale sector were also encouraged by directed credit to small businesses and industries by the nationalised commercial banks and by the overall economic and political environment which favoured the small scale industrial and services sector at the expense of the large scale. Urban employment also increased 'significantly' due to the booming construction sector as many ambitious public sector programmes were initiated [Tahir 1999:111];¹³ urban wages also rose sharply in the mid-1970s.

While many of these programmes and initiatives may have had employment enhancing and poverty reducing consequences, an additional factor which was to change the face of Pakistan's economic and social structure, particularly in the 1980s, had its origins in the mid-1970s, and was to have a significant impact on poverty reduction from 1975 onwards up to the end of the 1980s. This was the process of migration to the West Asia and the beginning of the remittance economy. During the 1972-77 period alone, as many as 100,000 workers left Pakistan to work overseas, sending in \$ 1.4 billion in this period, a sum greater than the oil import bill for the country (even after the OPEC price rise) in the same period [Tahir 1999:110]. In the period 1977-80, an additional \$ 4.2 billion had been remitted to Pakistan from the West Asia.

This process which began in the 1970s was to become the single biggest factor which resulted in the high growth rates for the economy and, simultaneously, for poverty reduction, in the decade of the 1980s [see Amjad and Kemal 1997; see Table 4]. A great deal has been written on the West Asia phenomenon and its impact [Addleton 1992] and in this section we look mainly at the broader economic growth and poverty-reducing mechanism, with far more detail at the nature of that growth and on poverty on account of remittances from the West Asia, in a later section. Moreover, since there are a large number of studies which look at trends in poverty in the 1980s and offer some explanations for the reasons in its decline [MHCHD/UNDP 1999; Gazdar 1998; Sahibzada 1999; Amjad and Kemal 1997;

Sayeed and Ghaus 1997, World Bank 1995; Burki 1995; Malik 1994; Ercelawn 1992], we present the more important arguments in somewhat summarised form below.

The high growth rates of the 1960s were repeated in the 1980s (Table 4) with the manufacturing sector leading overall economic growth, just as it did in the 1960s. It was primarily these high growth rates in the economy which were responsible for the fall in poverty for much of this decade. Income per capita in the 1980s rose by 3.2 per cent a year, compared to the 3.9 per cent rise recorded in the 1960s. Development expenditure continued to be high for most of the 1980s, as did spending on the social sectors, especially in the period 1984-85 to 1987-88, when poverty fell markedly (Table 1) - this period is dealt with separately below because of the large reduction in poverty. The trend of increasing public sector employment begun in the 1970s continued well into the decade of the eighties; urban and rural wages also showed signs of an increase in this period. Probably the most important contributor to growth and to poverty reduction in this period was the amount of money remitted from the West Asia. In the decade of the 1980s, as much as \$ 23.1 billion were remitted to Pakistan, equivalent to almost 10 per cent of GDP in 1982-83 - see the implications of this in another section below.

Although the discussion above presents some of the more general arguments which help explain the fall in poverty in the 1980s, it would be useful to look at some more detail at the period 1984-85 to 1987-88 when perhaps, poverty fell the fastest in such a short period. There are many specific causes for this reduction which throw light on issues related to poverty reduction at the end of the current decade.

TABLE 4: GROWTH RATES
(Per cent)

Decades	GDP	Agriculture	Manufacturing
1950s	3.1	1.6	
1960s	6.8	5.1	9.9
1970s	4.8	2.4	5.5
1980s	6.5	5.4	8.2
1990-97	4.6	3.8	5.0

TABLE 3: TREND IN GROWTH, POVERTY AND INCOME DISTRIBUTION

Decade	Growth	Poverty	Income Distribution (Gini)
1950s	Stagnated	Persisted	Unknown
1960s	Rapid increase	Increased	Improved
1970s	Slow, Stagnated	Declined	Worsened
1980s	Rapid Increase	Declined	Rapid deterioration, followed by rapid improvement
1990s	Substantial decline	Increased	Unknown

While remittances from the West Asia continued to play a critical role in terms of economic growth and poverty alleviation between 1984-85 and 1987-88, a number of other important indicators and trends in this short period stand out: public expenditure in this period was above 26 per cent of GDP in three of the four years, and was 26.7 per cent of GDP in 1987-88, 'the highest ever in the country's history' [Tahir 1999:118]; the overall government deficit was on average 8.2 per cent of GDP, higher than the annual average of 7 per cent for the entire 1980s. A key component of the development strategy in this period was the Junejo government's Five Point Programme, launched in 1985-86, which had a high rural component. The programme focused on education, health, roads, electrification, water supply and sanitation, seven *marla* plot schemes for rural housing, all with a primarily rural focus. In addition, there was the special development programme for local development, education and housing, along with the Senators' and member of the National Assembly's (MNAs') programmes, where elected representatives were allotted large amounts of money to spend on development projects in their constituency. Expenditure by government on health (as a percentage of GDP) in this period was higher than the average 0.7 per cent for the 1980s, rising to 1 per cent of GDP in 1987-88, amongst the highest allocations ever; similarly, expenditure on education in this period rose to an average of 2.3 per cent of GDP, higher than the 1.9 per cent average for the 1980s. The overall financial allocations for the Five-Point Programme exceeded the Plan allocations by 18 per cent. There was a significant shift in resources 'towards rural areas as rural development utilised 48 per cent of the actual expenditure compared to the 32 per cent allocated originally in the Plan' [Tahir 1999:118]. Moreover, this accelerated spending on rural infrastructure is said to have promoted employment and income opportunities for the rural poor, while some urban schemes offered opportunities for the urban poor and unemployed [Tahir 1999:118]. Moreover, even growth showed above average trends, with 6.8 per cent growth in GDP in this period, compared to the 6.45 average for the entire decade; with a bumper cotton crop of 8.6 million bales, growth in 1987-88 was led by an impressive 10 per cent growth in the manufacturing sector. Along with impressive rates of growth and poverty reduction, this period also probably saw the largest falls in the Gini coefficient suggesting that reduction in income inequality also

improved; the Gini coefficient fell from 0.428 in 1984-85 (probably the highest ever), to 0.348 in 1987-88. Interestingly, the Five-Point Programme was terminated with the dismissal of the Junejo government towards the end of the fiscal year 1987-88, in May 1988. Perhaps the culmination of this programme helps explain the trends observed in the incidence of poverty after 1988, as shown in Table 1.

WHY DID POVERTY RETURN TO PAKISTAN AND WHY DOES IT STILL PERSIST? 1988-99¹⁴

Perhaps the answer to this question lies in much of the argument made in the previous section, especially regarding the fall in poverty in the 1980s, and more specifically, with reference to the period 1984-85 to 1987-88. The factors which led to poverty reduction in the eighties were, primarily, high growth rates helped by very significant remittances, and an active and spendthrift public sector. Let us examine the trends in these and other key influences on poverty towards the end of the 1980s.

Just as the declining trends in poverty at the end of the 1980s coincide with the end of the Five-Point Programme, they also, equally coincidentally, begin a slowing down or reversal, at the start of a comprehensive IMF-funded structural adjustment programme (SAP) initiated in the fiscal year 1988-89, in December 1988. Although there has been criticism on the rationale for Pakistan undergoing such a programme when it did, it is important to describe the nature and contents of such programmes.¹⁵

One of the criticisms that has been directed against the IMF and the World Bank sponsored SAPs is that these programmes are usually too uniform in nature and are implemented universally across countries, without taking due cognisance of particular histories, institutions, structures, and these programmes lack any semblance of contextuality. A very general economic restructuring programme designed for any or all countries in need of restructuring has, at best, a few minor specificities which are spelt out in the details of the programme for each country. Usually, a few specific targets or a set of numbers to be achieved at the end of the programme period, differentiate one country's programme from that of another.

Structural adjustment programmes are meant for economies in 'distress', often on the 'brink of disaster', having usually, though not exclusively, balance of payments problems. The aim of the SAP

is to reduce the current account deficit, to lower inflation, increase the growth rate in the economy, and to cut the fiscal deficit. The mechanism to achieve these goals is, by now, fairly well known and standard. Countries are expected to remove non-tariff barriers, replacing them with tariffs, tariffs which are supposed to be lowered substantially across the adjustment period, so that cross-border 'distortions' are removed by getting 'prices right'. On the trade front, in addition to large reductions in tariffs, countries are expected to devalue their currencies so that domestic currencies better reflect the true price of foreign currencies, where their demand and supply, rather than government intervention, determine that price. Greater liberalisation and openness, with more focus on exports, rather than on import substitution, form the key ingredients of what goes for trade sector 'reform' under the SAP.

Often the fiscal deficit is considered to be the mother of all evils, and the most significant and real cause of the distortions and problems that exist in the economy. In fact, all the problems which determine the need for a SAP, such as, high inflation, low growth, a high current account deficit, lower private sector investment, crowding out, and sundry problems are (incorrectly) attributed to a high, 'unsustainable' fiscal deficit. Hence, a cut in the fiscal deficit is probably the most important component of the SAP. The World Bank and the IMF advise countries undergoing adjustment to rationalise their tax structure, to impose a consumption-oriented general sales or value added tax, to impose taxes on sectors of the economy currently exempted, and to remove all special privileges given to sectors of the economy in order to encourage certain industries or sectors. On the expenditure side, a cut in government expenditure is critical in order to reduce the fiscal deficit, where privatisation is promoted so that loss-making government departments and institutions can be handed over to the private sector. While the emphasis in cutting government expenditure is usually on consumption expenditure, frequently countries are asked to cut overall spending which includes capital and development expenditure. By hoping to raise revenue by imposing more taxes, and by cutting 'wasteful' government expenditure, countries are expected to reduce their fiscal deficit to more 'sustainable' levels. The removal of subsidies which, in most underdeveloped countries are on food items, essential inputs like fertiliser, or on utilities, is also an important plank of the policy directed to reduce the fiscal deficit.

Regardless of the causes for inflation, monetary 'discipline', in the form of limiting monetary expansion to some preconceived quantum, is supposed to be part of the adjustment programme. The interest rate, at the same time, is supposed to be determined by the supply and demand for credit and money, i.e., by the market. Government intervention to determine the interest rate or to provide directed credit to key sectors and industries at subsidised rates, is actively discouraged. Financial liberalisation, with less government control over the banking sector, with far more competition, is expected by countries following agreements over the adjustment programme. Also, the preferential financial treatment to state-owned enterprises is to be eliminated, so that these enterprises become more responsive to market signals.

In essence then, the SAP is supposed to be more market friendly, it is expected to promote private sector initiatives and interests, remove distortions in the economy by getting domestic and cross-border prices right, and to open up the economy to foreign goods and competition from abroad as the process of globalisation proceeds. In addition, privatisation should form an important component of the programme, and the role and involvement of the government in the economy and other sectors, should be minimised. The government's role should become one of an 'enabler', rather than an implementor, so says this philosophy.

Having followed at least three SAPs (of the Extended Structural Adjustment Facility – ESAF – variety) and numerous smaller programmes since 1988, it would be important to examine some of the measures taken by the numerous governments in power in Pakistan since 1988, and determine the consequences on key variables affecting poverty.

Although it is difficult to prove causality, some interesting observations on the economy after 1988 help show how the economy has performed after the initiation of the SAP. Firstly, the overall growth rate of GDP has fallen well below trend levels, and appreciably below the average of the 1980s (see Table 3). In the nine years since the implementation of the programme, in only one of those nine years was growth in GDP more than the average 6 per cent observed since 1977; in two of those nine years, in 1992-93 and in 1996-97, the growth in GDP was 2.27 per cent and 1.3 per cent, respectively, the lowest in more than three decades. In the nine years since 1988, inflation was in double digits in seven of those nine years, while previously

in the 40 years between 1947-87, inflation was in double digits on only seven occasions. Even the State Bank of Pakistan's Annual Report for 1996-97 admitted that 'almost all macro-economic indicators showed that 1996-97 was one of the most difficult and disappointing years in the economic history of the country' [cited in Tahir 1999: 126]. Another government report accepts the fact that since the growth rate of real per capita income has been about 1.3 per cent in the period 1991-98, it 'has been very low to make any dent on poverty' [GoP 1998b: 3].

At one stage manufacturing had been the leading sector in the economy, with growth rates averaging 9.1 per cent between 1980-88; this rate fell to an average of 4.9 per cent for the period 1988-97, falling to a mere 1.19 per cent in 1996-97, the lowest in the last 30 years. As an obsession to cut the fiscal deficit, public expenditure has been cut, and development expenditure in particular has borne this brunt. From a high of 9.3 per cent of GDP in 1980-81, development expenditure has been falling since, and in 1997-98, only a little over 3 per cent of GDP had been allocated under this head. Additionally, remittances, which had played such an important role in the 1970s and 1980s in alleviating poverty, declined by about 41.8 per cent (in constant prices) between 1982-83 and 1995-96 [Amjad and Kemal 1997: 56] and in 1996-97, were the lowest since 1978-79.

Public sector employment, historically an important anti-poverty measure, has fallen, while wages have decreased in real terms: real wages, which increased by 0.7 per cent between 1980-91, fell by 2 per cent between 1991-95 [Sayeed and Ghaus 1996]; public sector employment is estimated to have fallen by 10 per cent during 1990-93, and 43.2 per cent of workers previously employed in public enterprises were laid off by their new employees [Kemal 1994]. Moreover, it has been seen that 'overall unemployment in occupations with a high incidence of the poor has dramatically increased and real wages of skilled and unskilled labour sharply declined. In addition, subsidies that were critical to the consumption pattern of the poor have been cut while the burden of indirect taxes on the poorest income group has increased. Not surprisingly, there has been an increase in poverty and inequality, particularly in the rural areas' [Khan 1997: 203-04]. Providing statistical evidence for these figures, Kemal (1994) has shown that the share of wages in national income fell from 32.3 per cent

in 1987-88 to 30 per cent in 1990-91, and personal income distribution which improved between 1979-88, worsened considerably between 1987-91, with the overall Gini coefficient increasing from 0.35 in 1987 to 0.41 in 1991; in rural areas, the Gini coefficient increased from 0.307 to 0.41 in the same period [Kemal 1994]. In addition, not only was there a cut in food subsidies of 22.4 per cent between 1991-95 [Sayeed and Ghaus 1996], there has been a cut in subsidies from 2 per cent of GDP in 1988-89, down to only 0.5 per cent in 1996-97 [Jahir 1999: 125]. Moreover, the 'rationalised' tax structure has resulted in more indirect taxes, with a decline of 4.3 per cent of the tax burden on the rich, with an increase of the tax burden by 10.3 per cent on the poor [Kemal 1994]. The rate of unemployment which was 3.1 per cent in 1987-88, has increased to around 5.4 per cent in 1997-98, with more than two million currently unemployed. The government of Pakistan estimates that the extent of underemployment is currently around 20 per cent of the labour force, and that as many as 1.3 million persons will enter the job market each year adding to the pool of the unemployed, as at least half of these 'cannot expect to find work at the present rate of labour absorption' [GoP 1998: 6]. It fears that 'the problem of unemployment may intensify further' [GoP 1999: 14].

It is important to emphasise that while these numbers show a very obvious downward trend since 1988 when the SAP was introduced, we cannot prove that this is on account of the programme alone, since there are numerous other factors which have also affected the economy since 1988. Nevertheless, given the dramatic changes that have taken place as a consequence of the programme, common sense suggests that it is more than likely that the adjustment programme had a large contribution to play in this downtrend. The result of these dramatic trends is, clearly, likely to be seriously deleterious.¹⁶

Every single indicator which has some poverty reducing impact, such as economic growth, manufacturing sector growth, employment, public expenditure, development expenditure, remittances, and subsidies, has worsened over the last decade. The impact on poverty should be equally clear. It is no surprise then, that poverty has increased in Pakistan over the last decade, and given current macro-economic trends, is likely to persist and possibly increase over the next few years.

What emerges from the discussion above is that poverty alleviation has taken place via the mechanism of economic growth, high remittances and active public policy, rather than specific policy designed to alleviate poverty as such. There have been some special development programmes, like the Junejo government's Five-Point Programme, which had a focus on employment generation and on infrastructure development, but again, not specifically with a poverty alleviation focus. It seems that poverty has been reduced in the past through other linkage mechanisms, rather than through a direct 'assault' on poverty itself. This has been the case even when poverty was at its greatest heights in the 1960s, when explicit poverty reducing policies did not really exist. There does not seem to have been a conscious effort to alleviate poverty in the past, and most of the reduction may have taken place primarily as a result of positive externalities. It is only of late, after around the mid-1990s, when there has been a scare regarding poverty and direct attempts to reduce it have been devised.¹⁷ However, before we examine the new strategy for poverty reduction for the next few years, it might be worthwhile to consider in some detail, what may have been the best and most effective poverty alleviation mechanism in Pakistan, that of remittances.

References to the role of West Asia remittances from 1975 to the end of the 1980s in the sections above have accentuated the significance they had on growth and on poverty alleviation. However, what is often overlooked, is the mechanism through which remittances acted as a poverty alleviating device.¹⁸ It has been argued that 'large scale migration to the West Asia became the single most important economic event in Pakistan during the 1970s and 1980s. No other occurrence had such a pervasive impact on so many areas of Pakistan's economy and society' [Addleton 1992: 4]. Most of the migrants from Pakistan came from rural areas and many 'thousands of rural Pakistani families participated in the employment and remittances boom in the West Asia' [Addleton 1992: 88]. More than two million people were sent abroad, out of which at least 1.2 million were from rural areas. There was widespread participation from the *barani* districts of the Punjab and NWFP, which represent some of the poorest districts of the country: 'in this sense, the West Asia migration had a certain redistributive aspect in that it

provided at least temporarily exaggerated income streams to some areas where opportunities for productive employment were extremely limited' [Addleton 1992: 95-96]. Household incomes for a few years were seen to have been increased by anything between two to four times. The sectors whose growth of output was affected most by the increased demand generated by remittances, included the small scale sector, construction, transport and communications, and wholesale and retail trade, especially in rural and peri-urban areas. Increases in incomes, especially for poorer families, resulted in increased expenditure on food, clothing and shelter [Addleton 1992: 137]. Because of the individual nature of decisions about consumption, savings and investment, the developmental impact of remittances resulted in 'diffused, decentralised modes of development' [Addleton 1992: 125]. In comparison, 'official development expenditures reaching individual villages in the less developed *barani* areas paled in comparison with income generated by migrants themselves' [Addleton 1992: 147-8]. It was not only the large number of migrants and their families who benefited, but local economies were also transformed in many ways, with local produce (milk, fruits, vegetables, etc) being in greater demand as incomes rose, which 'enhanced the impact of remittance spending locally, increasing incomes and employment opportunities for villagers not directly involved in migration' [Addleton

1992: 153]. Many returning migrants opened shops and hotels, started taxi services, opened small workshops, all of which had similar results. There were visible aspects of change, such as 'increased transportation, improved housing, high rural incomes, more diversified village economies, decentralised decision making, expanding availability of consumer goods, and so forth' [Addleton 1992: 155]. As Burki writing in 1988 argued, 'the reason why Pakistan seems to be relatively free of absolute poverty has less to do with deliberate government policy; it is more the result of remittances from the West Asia' [quoted in Addleton 1992: 163 fn].

It is only very recently that the government has actually accepted the existence of poverty and has acknowledged that not only does it exist, but that it has increased over the last decade. With task forces and working groups set up to provide insight into the persistence of poverty, a programme for the alleviation of poverty has been announced, and has even been included as a 'strategy' in the Ninth Five-Year Plan. Unlike the previous non-strategy, where the government was mainly involved in running the economy and in providing developmental expenditure and services, the current strategy sees a far more active and involved role for government in poverty alleviation [GoP 1999, 1998, 1997]. Government now enters as an active agent in the process of poverty alleviation.

New from Books for Change

THE STRUGGLE TO BE HUMAN

The Struggle to be Human: The author explores the spiralling gender-based violence within marriage and in the household. She examines how the rhetoric of rights in the Constitution and the Universal Declaration of Human Rights have remained only on paper. Stark case studies are cited to further authenticate the issue. Women indeed deserve a more humane and gender-sensitive world. **Rs125/-**

In India increasing globalisation, the information revolution and technology changes, growing political interference, a quickly deteriorating environment, and fast changing demography, all pose a challenge. The authors alert us and make us realise that to avoid the problems, we have to meet the needs of the present without compromising the ability of future generations to meet their own needs. **Rs120/-**

The main components of the human development and poverty reduction strategy include the following [GoP 1999, 1998, 1997]:

- substantial economic growth, at a fast pace, resulting in an increase in per capita income; sustainable economic growth is to take place through infrastructure development, taxation reform, financial sector development, a restructuring of the manufacturing sector, and an overhauling of the agrarian system; growth is to be labour intensive and 'people friendly';
- to provide employment opportunities to counter the recessionary trends and to provide employment for poverty reduction;
- expand and improve the quality of social services;
- mobilisation of support organisations, NGOs, and partnerships with the private sector;
- community based participatory development programmes;
- a system of social safety nets;
- micro-credit programmes for the poor;
- development of human resources and basic skills;
- information needs for poverty policy;
- empowerment of women; and
- the issue of governance.

Earlier, the Working Group on Poverty Alleviation and the Task Force on Poverty Alleviation, included:

- setting up small scale industrial sectors;
- a national reconstruction corps;
- setting up various training institutes;
- schemes for the eradication of child labour; and
- setting up of rural support organisations.

On paper, at least, it seems that the objectives, intentions and approaches of the poverty reduction strategy and of the task force and the working group, seem well meaning. However, examined at closer quarters, most, if not all, attempts are likely to fail or to fall far short of any meaningful targets.

There are three main criticisms which make this strategy somewhat less meaningful, dealing with issues related to, firstly, macro-economic objectives having an impact on employment, growth and public expenditure; secondly, issues of targeting; and finally, issues related to the non-governmental organisation sector and community participation.

The economic strategy of the government which announced these ambitious goals, continues to be that of structural adjustment. Almost every study that has critically examined the impact of such economic programmes has emphasised the negative impacts on growth, employment, public expenditure and on poverty. Even the

World Bank (1995) which is a strong proponent of the SAP acknowledges that there are significant transitional costs – however, how long this transition is to continue and when, if ever, these trends improve, is never made clear. Even the government of Pakistan accepts that there are very serious consequences of following this policy:

Pakistan's economic reform agenda calls for major structural changes, the burden of which has and is likely to fall largely on the weaker segments of the population. In the past, rising unemployment, inflationary tendencies and high cost of essential imports, all have had adverse impact on the poor. Fiscal expediences increasing reliance on the indirect and regressive measures in taxation, continued decline in the ratio of PSDP (Public Sector Development Programme) to GDP, privatisation, have also placed a significant proportion of the transitional burden on the poor with increases in unemployment .. One major area of concern is to prevent poverty increases in the transition period, particularly in view of declining public sector expenditures and its negative impact on employment generation (*sic*) [GoP 1999: 6]

This analysis continues with an extensive list of the negative consequences of following the SAP, and the realisation that these policies have given rise to the 'current recessionary situation'. It argues that as a consequence, there has been an 'adverse impact on employment, increase in poverty, and more importantly vulnerability of those above the poverty line to the poverty trap, caused by a massive reduction of employment opportunities, reduction in construction activity across the country, and an overall depression in economic activities' [GoP 1999: 8]. Having realised what has happened in the past, nevertheless, the government is 'committed to reduction of budget deficits and other stability measures – [L]imitations on the size of the development programme and limitations on its pro-poor nature may adversely impact the unemployment problem' (*sic*) [GoP 1999: 8]. In light of these trends, a senior government official concludes, that 'in this environment, poverty as a concern cannot figure prominently' [Tahir 1999: 126].

Other writers have found that, although the slowdown in economic growth in the 1990s had serious consequences for poverty reduction, the current economic agenda of the government continues to be that of the earlier years, with the opening up of the economy, reduction of subsidies, and more privatisation. These so-called reforms, 'have not yielded tangible benefits

in terms of growth or poverty reduction' [Gazdar 1998: 13], and the context for poverty alleviation or elimination is not as promising now as it was in the 1980s. In order to address the problem of poverty, Burki argues that the economy needs growth at 'twice the increase in population growth to make a serious difference in the incidence of poverty' [Burki 1995: 10]. A growth rate of between 5.6 and 6 per cent each year seems unlikely given recent trends in economic growth of 1.3 per cent (1996-97), 5.4 per cent (1997-98), and the expected 3.5 per cent for the current fiscal year 1998-99. Given the experience since 1988, it seems that few of the major macro-economic indicators affecting growth and poverty will improve, making many of the government's initiatives for its poverty reduction strategy redundant. It seems that the transitional period is likely to continue for some time yet.

Some of the new initiatives proposed by the government require effective targeting if any worthwhile results are to be accomplished. Also part of the strategy are social safety nets which are currently in place in the form of *zakat*, *ushr* and the *baitul maal*, all of which require effective targeting. Moreover, the increased, direct, involvement of government in the lives of the poor would also require efficient delivery. The evidence available about the government's current targeted schemes does not confer much confidence in existing or future schemes. Findings have shown that the system of *ushr* is 'monstrous', and the system of *zakat* 'is not working effectively' [Beall et al 1994: ix]. These social safety nets are said to have low benefits and the 'coverage is generally low and amounts disbursed do not constitute a significant contribution to household budgets, and do not provide a springboard to lift the poor out of poverty' [Beall et al 1994: 4]. As Burki argues, despite these schemes, 'government support for the poor remains insignificant', and, 'the state in Pakistan has failed to erect a strong safety net that can catch those people who fall into the trap of poverty as a result of economic and social changes' [Burki 1995: 2]. Numerous cases have been cited which suggest that the mechanism for social safety nets is seen as 'being both inefficient and corrupt', and corruption, patronage, political influence and pilferage appear to be widespread problems. Hence, 'in the current administrative climate and in the context of high levels of popular scepticism and mistrust, developing strategies for sustainable social assistance programmes cannot be separated from the issue of governance' [Burki 1995:

xii]. The high profile, much publicised, donor-funded social action programme may have just helped in keeping the level in government expenditure in a few social sectors at their previous levels despite overall fiscal cuts, but evaluations of the three year first phase, have been far from flattering [Zaidi 1999c, 1999b, SPDC 1998]. Institutional failure and issues of 'governance' have been a key feature resulting in the poor quality of focused government intervention. Given existing governance structures, whether the new strategy, with government as an active agent, will be able to overcome these structural constraints to better targeting, is highly questionable. In fact, perhaps the now discontinued, general subsidy scheme – on wheat, fertiliser and on other inputs – despite numerous problems, may have been a better mechanism to address issues of poverty, rather than the current and proposed targeted schemes.¹⁹

Although there is growing lip service paid to the role of 'community' participation and the role of NGOs, there is also wide recognition that in the context of Pakistan, with the exception of a very few NGOs, most are not particularly effective. Moreover, it is felt that even the few participatory development NGOs which reach out to poor communities, 'do not necessarily reach the poorest within them' [Beall et al 1994: xiii]. Even the government, which has begun promoting the role of NGOs, recognises that 'very few NGOs are working on poverty alleviation, participatory development, gender equity and capacity building at the grass roots level. Very few of them have well-defined governance, transparent and accountable structures. Large number of NGOs relies [sic] entirely on financial support from government and international donors. Their survival as a sound financial entity is questionable in the absence of sound financial support' [GoP 1998: 15]. Extensive evidence from the rural water supply and sanitation sector, which is one of the main components of the social action programme, shows that NGOs are not yet capable of taking over government built water schemes, and the expectations that 'communities' and NGOs will be able to do development, are highly exaggerated [see chps 5 and 6 in Zaidi 1999c]. Yet another pillar in the plank of the poverty reduction strategy comes unstuck.

Microcredit schemes and the rural support organisations proposed under the strategy have also been criticised by Gazdar (1998). He argues that the proper perspective on microcredit has not been recognised by government in its strategy,

where the poor need credit not so much for asset creation as the strategy sees it, but for consumption smoothing and as insurance against adverse shocks. He also questions the concept and governance structures of the proposed rural support organisations, and argues that these proposals 'fail to spell out adequately the governance structures in these organisations, their responsiveness, and accountability to central and provincial governments, their relationship with existing "community mobilisation" initiatives, and their relationship with elected government' [Gazdar 1998: vii].

This critical evaluation of the proposed poverty reduction strategy seems to suggest that perhaps the poverty alleviation mechanisms of the 1970s and 1980s were far more productive than the current ideas generated by government. If this is indeed true, we must then ask the question posed as the title of this paper.

IS POVERTY NOW A PERMANENT PHENOMENON IN PAKISTAN?

All signs suggest that the answer to this question is an unequivocal 'yes'. In a recessionary situation which has continued for the last few years, growth rates are well below previous trend rates, and are likely to continue to be below par for a few more years into the future. Public expenditure on development and the social sectors, which has made a non-trivial contribution to poverty reduction, has continued to decline and is less than one-third of what it was in the early and mid-1980s. Remittances which have been a key poverty alleviating instrument, having a wide decentralised distributional impact, are down to their lowest levels in 20 years. Experience at targeting and at micro level, focused, poverty alleviating initiatives, does not restore much confidence in government's ability to address these issues

efficiently and effectively, a fact which government itself concedes, if somewhat reluctantly. With far greater donor dependence and reliance on funding for structural adjustment and stabilisation from the IMF and World Bank, all indications suggest that the trends which resulted in an increase in poverty and in the worsening of income inequality, are likely to continue and probably be aggravated.²⁰

Even if in an unlikely event, growth rates do somehow, miraculously, rise to the perceived poverty reducing level of around 6 per cent per annum at some time in the future, and manage to be sustained at that level, what cannot be overlooked is that in this rather long so-called transitional period, the given stock of the poor is going to continue to be added to, making it quite impossible to deal with the huge pool of the poor that emerges. The estimated proportion of the poor is currently 26 per cent of the population at around 36 million individuals and 6 million families. All observers feel that things are going to get far worse before they begin to show any signs of improvement, which will result in a rising pool of the poor, both in proportional and absolute terms.

Moreover, as a central theme of this paper argues, it is not simply economic growth, even high economic growth, that determines poverty alleviation, but the nature and distributional impact of that growth (pace, remittances), which has specific poverty alleviating outcomes. It is also important to emphasise that while a number of researchers feel that the decade-long, near 7 per cent growth rates of the 1960s will be sufficient to bring about the conditions for poverty alleviation, the structural nature of the economy at the end of the 1990s is radically different from that of three decades ago and hence, there are likely to be different outcomes. For example, the role of

The Kargil War

PRAVEEN SWAMI

Demy Bvo, pp vi + 111, paperback Rs 60

In the summer of 1999, India fought off the Pakistani intrusion in Kargil. However, the end of the war does not mean the beginning of peace for people on either side of the border. Drawing on his experience of several years of covering Jammu and Kashmir as a journalist, the author uncovers vital data and analyses the long-term reasons behind the war, its course, and its consequences.

government in the provision of basic services has diminished considerably since the 1960s and now most services and utilities will have to be bought from the market requiring, perhaps, larger incomes. Also, at a macro level, with a far more closed economy than then now, increases in growth may have been consumed/re-invested in the country; now with a far greater import component in the economy, some gains in incomes may be lost to the domestic economy. It seems then that not even in the most optimistic scenario, are we likely to observe any sizeable reduction in the number and proportion of the poor for some years to come. Clearly, all sober assessments of Pakistan's economic and poverty trends suggest that not only has poverty returned to Pakistan, it is likely to be a permanent fixture.

Notes

[This paper was prepared for the Institute of Development Studies, University of Sussex, as part of the study 'Meeting the International Development Targets: What Are the Prospects and Key Challenges? Pakistan Country Study', to form a part of the World Bank's *World Development Report 2001*. This paper has benefited from comments made on an earlier draft by Aly Ercelawn, Susan Joekes, Lucia Hammer and Asad Sayeed.]

- 1 Two papers with similar titles: 'Has Poverty Returned to Pakistan?', and 'Poverty Returns to Pakistan?', appeared around that time; see, Sayeed and Ghaus (1996), and Burki (1995).
- 2 See, for example, Mahbuhul Haq Centre for Human Development/UNDP (henceforth MHCHD/UNDP), (1999), and Gazdar (1998). See also, Zaidi (1999a) for a complete list and a bibliography of all research on poverty in Pakistan.
- 3 See the study by Gazdar (1998) for details on methodology and estimation; Zaidi (1999a), also presents comments and summaries of all papers published on poverty in Pakistan, and some comment on methodology is to be found there.
- 4 There is even greater confusion over estimating such distributions, and disputes exist over the extent of poverty even in a relatively simple distributional format such as rural/urban. See Gazdar (1998: 15).
- 5 Of the nearly four-score papers and reports on poverty in Pakistan, only a small handful have actually explained trends in poverty; the very vast majority have simply estimated poverty lines and the percentage of the population below these lines. See Zaidi (1999a).
- 6 In this paper we look at primarily income poverty.
- 7 See Gazdar (1998) for a note on methodology and Zaidi (1999a), for the different approaches used to estimate poverty in Pakistan.
- 8 However, it is necessary to add a word of caution in any such comparisons, as does the MHCHD/UNDP (1999): 'Due to different units of measurement, disparate counting units, divergent cut off points, and the selection of

- arbitrary and different poverty lines, these studies provide conflicting measures of poverty' (p 7).
- 9 Gazdar (1998): criticises this methodology used by Amjad and Kemal (1997) to establish this series.
- 10 The reason for this is that the SPDC (1998) study uses the World Bank's method of using the headcount approach assessing the proportion of the population with incomes of less than one dollar per day on a purchasing parity basis. Hence, these estimates differ considerably from other, consumption-based, approaches.
- 11 For an extensive debate about the nature and extent of the structural changes and relations that took place in the 1960s, see, Zaidi (1999h).
- 12 For the reasons why economic growth during this period was not of 'historical proportions', see Zaidi (1999h), where it has been shown that rather than simply blaming the Bhutto government for its poor economic policies, it is perhaps more important to critically reassess this period, where numerous 'bad luck' factors – such as the OPEC price rise, floods, pest attacks, etc – may have had a bigger impact.
- 13 See Tahir (1999) for greater details of the Bhutto government's social and economic policies.
- 14 Parts of this section of this paper are drawn from Chapter 9 of Zaidi (1999c).
- 15 For more extensive details on the structural adjustment programme, see the references cited in Chapter 9 of Zaidi (1999c).
- 16 The other factors which have affected Pakistan's economy since 1988 include lower remittances, political instability as reflected by frequent changes of government although the economic restructuring policies have remained more or less unchanged since 1988, and the sharply deteriorating law and order situation.
- 17 This is also evident from a bibliographical review, where earlier attempts were made at measuring poverty and only recently has there been any analysis on its causes and cures; see Zaidi (1999a).
- 18 This part of the paper is based on the work by Addleton (1992).
- 20 Throughout this paper we have used the concept of income poverty rather than human or basic needs poverty. This is done as a matter of convenience, since income poverty comparisons run further backwards into time than any other estimates. Moreover, it has also been shown that, the pace of human development 'precisely mirrors the pace of economic growth and the pattern of income poverty incidence', [MHCHD/UNDP, 1999: 53]. Also, in times of extended economic crises and recessions, perhaps income and the lack of it, better reflect the situation of the poor, as has recently been observed in east Asia.

State, Market and the Crisis in Raniganj Coal Belt

Kuntala Lahiri-Dutt

The recent decision to close down 64 'uneconomic' collieries in ECL's jurisdiction would render 72,000 people unemployed, besides hurting the economy of the Raniganj coal belt. The decision was apparently triggered by an ICICI report which has found that ECL's losses are concentrated in its underground mines. This article takes issue with the report and suggests that the proposed closure could be the first step towards privatisation of coal mining.

UNTIL the 1960s a resource management decision addressed such questions as whether a project was technically feasible, financially viable and legally permissible. Since then a paradigm shift has occurred. Instead of pure cost-benefit analysis in economic or technical terms, resource planners all over the world now include 'impacts' – both environmental and social – in their analyses. Therefore, when one comes across an old-fashioned economic cost-benefit analysis these days, one raises one's eyebrows.

However, the matter assumes serious proportions when a public-sector company uses such a 'report' as justification for laying off as many as 72,000 employees. It then becomes imperative to take a closer look at the report and the circumstances that produced it. Most of all, it requires an understanding of how the report is intended to be used – as a weapon against the popular will – and of the alternatives that were feasible for the interest groups involved. However, let us first take a brief look at developments in the coal mining sector all over the world and the response of the state-owned coal mining industry of India to these developments.

Competition, declining mineral grades, higher treatment costs, privatisation and restructuring are issues that have been putting pressure on mining companies to reduce costs and improve productivity. Employment is falling in many mining areas – as a direct result of better productivity, radical restructuring and privatisation. Not only are these changes displacing mine workers from employment, those remaining in the industry are having to work in a very different way, a way which calls for more skills and greater flexibility. Therefore, finding the right balance between the desire of mining companies to cut costs and that of workers to safeguard their jobs has become a major issue throughout the world of mining.

Since 1988 the coal mining industries in most of the world's coal-producing countries have undergone considerable change. The driving forces have been different and the results varied, but the

central objective has been to make the industry more competitive, more self-sustaining and more viable as policy changes in the areas of technology, the environment and energy impose considerable burdens on the production and use of coal.

The essential objectives of restructuring, according to the International Labour Organisation (ILO) are to ensure energy security and the meeting of demand for coal – rather than attaining a predetermined, inflexible production target – while achieving increased productivity, lower costs, higher quality and greater worker safety and lessening the impact of mining on the environment. The ILO recognises that rationalisation will necessitate closure of mines, freeing of coal imports, a review of subsidies, diversion of investment from non coal-mining operations and, in some cases, moves towards privatisation. It has outlined two complementary lines of action: ensuring that an adequate safety net is in place and promoting non-coal-related activities in the regions concerned.

The Indian coal industry is now caught between the welfare approach of the state and the effects of the market post-liberalisation. It has begun to use recent changes in a way that is quite in contrast to what the ILO recommends. Coal India (CIL), which controls all major management decisions, including coal pricing, transport and allocation, decided quite some time ago to impart greater thrust to open-cast mining to lower the cost of production and increase output quickly. It has initiated a technology change which has helped increase production from about 90 million tonnes in 1977 over 250 million tonnes per year at present.

This paper looks at the existing situation in Eastern Coalfields (ECL) and discusses the nature and purpose of a restructuring plan prepared by the Industrial Credit and Investment Corporation of India (ICICI) which apparently falls in line with developments at the international level. It questions the viability of applying such gross generalisations in any context. It also argues that if environmental protection

were given its due, open-cast collieries too, may not seem terribly attractive from an economic point of view. The paper tries to establish that the losses of ECL are concentrated else – here – not in the underground mines – and that instead of downsizing its operations, the company should clean up its act and look into the manner in which it has conducted its business over the years if it is to regain profitability.

One of the 11 subsidiaries of CIL, ECL had been making huge losses ever since its inception and was becoming a burden on the parent body. In 1997 it was referred to the Board of Industrial and Financial Reconstruction (BIFR) under the Sick Industrial Companies Act (SICA), but through financial restructuring it was able to avert a crisis by a whisker. Unable to solve its chronic ailments, however, ECL has been handing over collieries on a plate to private contractors over the last couple of years. Several collieries in the Raniganj region of West Bengal have already been given over to private contractors to operate. In an attempt to formalise the process the company has now undertaken a complex and convoluted exercise the dubious intentions behind which are not apparent to the casual observer. It is only after a closer look at the region, the coal mining industry and the manner of implementation and the cost of restructuring plans that one can see the intentions for what they are.

In July 1997, CIL approached the ICICI for the development of a restructuring and revival plan for ECL. This plan (popularly called the ICICI report) was presented to CIL in August 1998. At a meeting in Calcutta in the last week of October, it was recommended to ECL. It was then sent to the coal and labour ministries for final approval. On the basis of this report ECL plans to close down 64 mines, most of them located in the Raniganj region of West Bengal, and retrench nearly 72,000 employees working in these mines. In 1997-98 ECL's cumulative loss from the 64 mines, which produced 7 million tonnes of coal, was Rs 4,200 million. But before we look at the contents of the ICICI report

let us discuss the special characteristics of the Raniganj coal belt, where most of these collieries are located.

MINING IN RANIGANJ BELT

ECL operates 121 coal mines, located in Burdwan, Bankura, Birbhum and Purulia districts of West Bengal and Dhanbad and Godda districts of Bihar. As many as 117 of these are located in the Raniganj belt of Burdwan district. In 1997-98 these mines collectively produced 27.44 million tonnes of good-quality thermal coal at 75.32 per cent capacity utilisation. Raniganj coal is unique in that it is of 'long-flame high-volatile-matter' with quick heat-release capability. It has specific applications in the glass and ceramics industry, for example.

Nearly half of this production comes from underground collieries – whereas the share of underground coal production nationwide is only 29 per cent – though in recent years ECL has begun to place greater emphasis on open-cast mining. Underground mining is usually done by the 'board and pillar' method: a mesh of tunnels or galleries are first driven into the coal seam, leaving coal pillars for roof support. Twenty to 30 per cent of the coal reserve is extracted in this 'development phase'. In the final, 'depillaring' phase, the pillars are also extracted. If the surface area is free from human settlements, it is allowed to subside in this phase. If the mine is under a town or a village, then the holes are filled up with sand mixed with water. This process is called sand stowing.

Not all coal deposited underground can be extracted through this labour-intensive process. Therefore, ECL has launched open-cast projects with a high degree of mechanisation in recent years. Open-cast mines are located where coal occurs close to the surface. Heavy machines remove the soil and rock material, collectively called 'overburden', to deposit it in a nearby area in the form of huge dumps.

If sand is stowed properly, underground mines have a less pronounced impact on the environment. Open-cast projects (OCPs), as they are operated in eastern India, leave permanent scars on the land, disrupt the natural processes of rivers and soil formation, cause air and noise pollution, displace indigenous and peasant communities and destroy valuable farmland in adjacent areas. That is why it is that nowhere in the world is open-cast mining recommended for densely-populated areas. However, worked as they are in India without any attention being devoted to such considerations, OCPs yield better returns though their life span is shorter. In ECL, production from OCPs

has gone up more than twelvefold between 1975-76 and 1997-98 – from 1.23 million to 14.78 million tonnes.

In terms of capacity utilisation, however, the underground mines are really much better than the open-cast ones. ECL has some of the oldest underground mines currently in operation in the country. The deepest coal mine in Asia is at Chinakuri, 3,000 feet under the Damodar river. As many as 80 of the company's 121 mines were inherited at the time of nationalisation of the coal industry. The main problem with underground mines is that they get deeper and deeper as coal is extracted from the shallower faces, which increases the distance with coal, men and materials have to traverse with the increasing age of a mine. This of course has an adverse impact on the productivity and the capacity of the mine.

The older a mine, therefore, the more the resources required to sustain production at the rated capacity – which in turn affects the economic viability of the mine. This is significant because most of the underground mines of the Raniganj belt are quite old.

ECL has been a labour-intensive unit since its very beginning. It is now the single largest employer among the public undertakings in the Raniganj belt – and the largest landowner, occupying an area of 1,260 sq km. Since underground mines employ about 89.15 per cent of the company's manpower, the per capita output of its mines is significantly low at 137.62 tonnes per man year. The productivity in some of these mines varies from a low of 0.3 tonne to a high of 0.5 tonne per man shift. If a purely economic cost-benefit approach is adopted, therefore ECL's losses are seen to be concentrated in underground operations.

A loss-making concern since the time of nationalisation, ECL has been a typical case of the public sector failing to deliver the goods and sustain itself economically. There has been no thorough enquiry into its capital spending during the 25 years since nationalisation. The company inherited, along with the mines of private companies, a whole range of problems – environmental, social and economic – some of which are unique and specific to the region. The long history of coal mining – the Raniganj region pioneered coal mining in India – has left its imprint on the region's economy, physical environment, the attitudes, values, beliefs and perceptions of its mining-linked population and its socio-political scene.

The region has a land-dereliction problem, problems of an underground void,

land subsidence and mine fires, a problem of dying agriculture and decaying commons, and various manifestations of conflicts over resource use. These facts are hard to ignore while preparing a plan for restructuring and revival. Unfortunately, it appears that the ICICI report looked purely at the economics of mining, as if mining existed in an abstract, theoretical world. The environmental costs of mechanised open-cast mining were not included in its purview. Nor were the social costs, involving displacement of local communities and distress to them.

ENVIRONMENTAL CONCERNS

The entire range of precautions taken and procedures adopted to make mining the least harmful to human beings and the environment is described as 'best practice mining'. In ECL's plans for the environment, there is not even a mention of these practices and no clear direction is given by the administration to those involved in mining on how to go about protecting the environment. The best that has been done by the company so far consists of tree plantings here and there – sometimes on old overburden dumps, sometimes on leasehold land lying vacant and sometimes near the residential quarters of its important executives. Many of these saplings obviously die since they cannot survive on the rocky overburden material. Those which survive are of little use to local communities by way of food, fuel or fodder. The valuable topsoil, which best practice mining stores and returns to local communities after mining operations are over, is lost wherever open-cast mines are operated.

The level of urbanisation in the Raniganj belt is as much as 67.27 per cent – much higher than the Burdwan district (35.09 per cent) and state (27.48 per cent) levels. The long history of mining has attracted a large number of people to this region. Next to Calcutta city it is the most urbanised region of West Bengal. Such a high density of population poses a serious threat of subsidence in the case of underground mines and limits the scope of open-pit mines.

The 19 open-cast mines in the Raniganj belt are environmentally hazardous. Moreover, the average residual life of each such mine is as low as 2.1 years. These mines together employ about 12,207 people. The reason for the short life spans of open-cast mines in the belt is the fact that these mines are on outcrops and patches of the topmost seams in the area. Since heavy earth moving machinery has to be shifted frequently and since neither staff

nor equipment can be deployed on a permanent or a cost-efficient basis, these mines are bound to be of an ephemeral nature. The ICICI report says: "In order to fully exploit the economic benefits within the leasehold area, exploitation of these patches may be important. However, such operations can be undertaken more economically on a contractual basis." ECL seems to have taken its cue from this point.

The costs of operating a mine fall under several heads: wages, power, timber, petroleum, oil and lubricants (POL), explosives and stowing. In the Raniganj belt there is a heavy burden of wage cost, as is evident from Table 1.

IMPROVING PRODUCTIVITY

Let us now see what measures ECL has adopted so far to initiate a turnaround:

(1) The adoption of an exercise in which the manpower requirement of each mine has been assessed and 12,580 workers have been identified as 'surplus'.

(2) The introduction of a voluntary retirement scheme (VRS) under which an employee who has completed 10 years of service or 40 years of age is given a 'golden handshake'.

The VRS has not been very successful. This is mainly because alternative avenues of employment in the region have been more or less destroyed. Traditional agriculture and forest-based activities have decayed to an alarming extent. Moreover, a sizeable number of ECL employees are migrant workers who have no attachment to agriculture. The indigenous labourer has lost his connection with the local ecosystem due to the degradation of environmental resources.

The large manufacturing sector of the region – steel plants, locomotive works, etc – is oversaturated and throws up few employment opportunities. Several medium-sized units, such as the paper mill in Raniganj and the Sen-Raleigh factory, have closed down in the last couple of decades, further restricting the job market in the modern sector.

Why are so many workers considered 'surplus'? Unskilled labourers are employed in eastern India collieries, and by the time they develop some level of occupational skill (ordinarily in 10 to 12 years), their health deteriorates to such an extent that they become redundant labour. Rapid deterioration of workers' health is also related to poor conditions in the working environment, and ECL has so far not initiated any organised enquiry into this matter. Besides being considered 'surplus' on health grounds, a worker may come under that category when the spe-

cific skills acquired by him become redundant due to the introduction of new technology.

Finally, ECL considers a large number of women workers 'surplus'. It has increasingly shown a gender bias. Many of the women workers were originally employed on their own merit. But such cases of direct employment of women are becoming rare, and ECL now actively discourages employment of women even on compassionate grounds – as when a male member of the family dies while working for the company.

Mechanisation has been initiated particularly in the OCPs. A high degree of mechanisation is not possible in older underground mines as the cost of production would far exceed the sales realisation. Much of the mechanisation technology that ECL employs was imported from coal-producing developed countries. Total dependence on imported technology has not been quite successful in ECL, where the strata conditions are different from those existing in the advanced countries.

Kottadih, for example, was a flagship project of ECL assisted by French technology of underground longwall powered-support operation. In this kind of operation, six to eight huge steel pillars hold the roof while giant shearers raz the coal seams, and the entire process is controlled from the surface by computers. Three factors are of great importance while considering the selection of such technology: the nature (thickness and weight) of the overburden, the nature of the surface land use – as the land is allowed to subside after mining, displacement of communities and loss of cultivable land is inevitable – and the number of steel pillars which support the roof. On April 4, 1997, the roof of the mine collapsed over a stretch of about 5,600 feet, killing three people and injuring six others, and destroying machinery worth millions of rupees. The project is dead for the time being.

Another factor to reckon with is that the use of cutting and loading machines in underground mines using longwall technology generates enormous amounts of dust and noise, which pollutes the mine environment and poses safety and health hazards.

Lastly, some technologies are indivisible and hence may create other problems in turn. For example, in an open-cast mine there may be an 8-foot-thick layer of coal on top and a 20-foot-thick layer at a lower level. In Sangramgarh (Samdi), this 8-foot layer has been left out, and mechanised operations have begun to exploit the lower

layer, which is better suited for heavy machines. The exposed layer near the ground surface has attracted the local people, who have excavated coal illegally and left honeycomb-like holes. Both operations go on simultaneously.

Moreover, unauthorised mining goes on under the nose of the company in several other places of the region, and little has been done to solve the problem so far besides some exchanges of letters between ECL and district administrators. As for pilferage of coal from ECL collieries, it has gone so far that exports to nearby countries like Bangladesh and Nepal have been severely affected.

From Durgapur to the Barakar township there is no retail coal outlet for the domestic consumers in the region. The company expects the district administration to protect its property, and itself does little to control unlawful activities in spite of maintaining a large retinue of security guards. Stricter policing by the company could have solved many such problems. Also, a combination of indigenously available technologies rather than imported technology could have been the answer in a case like Sangramgarh.

SOME NEGLECTED REALITIES

Having considered the nature of the problems of ECL and their background, more specifically in relation to the 64 collieries proposed to be closed down, let us now go back to the ICICI report. The corporation has divided the 15 mining areas under ECL into four groups based on their 1997-98 economic performance. Group I:- profit-making, high-capacity open-cast mines: Raj Mahal, Sonapur Bazar and Santhal Pargana areas. Group II:- areas with profit-earning potential: Kajora, Bankola, Kenda and Kunustoria areas. Group III:- high-capacity, longwall mines: Jhanjra and Kottadih areas. Group IV:- mines with difficult working conditions (64): Satgram, Sripur, Salanpur, Sodepur, Mugma, and Pandaveswar areas.

TABLE 1: COSTS OF MINES UNDER ECL
(Per cent of sale value)

	Underground	Open-Cast
Wages	102.51	17.17
Power	17.22	3.51
Stores	7.93	14.44
Transport	2.64	1.80
Administrative exp	7.07	4.81
Miscellaneous exp	9.17	5.64
Interest exp	5.22	7.82
Depreciation	10.20	16.27
Total	161.96	71.27

This classification was done on the basis of two indices: a 'competitive index' (profit margins before interest and depreciation divided by profit margins after interest and depreciation), and 'attractiveness index' (assessed capacity per employee per year divided by production value per employee). The report does not explain why these indices were preferred.

The cost structures of the loss-making mines vary. The highest losses are made by the Sripur mine followed by Ningah, Nutandanga, Temehani, New Kenda, Kalipahara, Konardihi, Ratibati-R, and Chinakuri I. To produce 9,16,920 tonnes of coal, the percentage shares of costs in these mines is as follows: wages 66.08 per cent, explosives 1.2 per cent, timber 0.84 per cent, POL 0.4 per cent, others 3.5 per cent and sand stowing 27.93 per cent.

The stowing of sand in the underground mines is apparently the second largest head of expenditure. There is, however, no way to check whether or not the amount of sand claimed to have been stowed in underground collieries has actually been stowed. Some incidents of subsidence in and around recent workings have allegedly been due to negligence in filling up underground cavities. Table 2 extracted from ECL and JK Ropeways data sources clearly shows the discrepancy between the amounts of coal raised and the amounts of sand stowed.

Apparently, more sand has been stowed than coal raised; the data reveals that the entire business of sand stowing in underground trenches is a farce, an eyewash of the grossest nature, and reveals the hypocritical attitude of ECL to environmental concerns. The sand stowing business benefits neither the region nor the underground collieries. But it makes the 'contractor raj' powerful. However, what happens is that the underground mines 'apparently' lose economic viability in terms of purely financial cost-benefit analysis because of this added cost of sand stowing in underground mines. The ICICI report completely ignores this aspect.

ECL's claims of adequately stowing the underground voids have to be taken with a pinch of salt in view also of the fact that whereas a pre-nationalisation report identified 22 areas as 'unsafe', a 1997 report of the Director General of Mines Safety (DGMS) has marked 171 areas as unstable and unsafe for human habitation. A physical survey of these areas would help establish how many of them are post-nationalisation workings.

Taking the logic a little further, if even a semblance of the environmental care and the protective measures of land reclama-

tion and rehabilitation that are followed in other coal-producing countries were taken up in eastern Indian open-cast mines, instead of leaving gaping holes and huge overburden dumps, the profitability of OCPs is bound to be lower. Since there is no effective environmental planning and supervision in the true sense of the terms, the OCPs can get away with the holes and dumps just as the underground mines are sealed without being properly filled. This author's contention here is that the relative profitability of OCPs is only 'apparent'. Once the long-term environmental and social costs – Sonepur Bazari and Kottadih have caused large-scale displacements of local populations – are taken into consideration, the open-cast mines too would not come across as terribly 'attractive'.

Finally, any decision to close down underground mines will also have to be placed in a futuristic perspective. Mining operations would compulsorily turn to deeper horizons because of the exhaustion within two decades of deposits that are shallow and comparatively easy to mine. Underground mining, therefore, is the inevitable future of the coal industry. Handing over these mines to private operators on the ground that they are 'uneconomic' would be an extremely hasty decision.

STATE GOVERNMENT CESS

The reasons for the chronic sickness of ECL are several, the most important of them being the coal cess imposed by the West Bengal government. Whereas in other states only a royalty is imposed on coal, and that amounts to an average of Rs 135 per tonne, the West Bengal government imposed a cess of 47.5 per cent *ad valorem* on coal produced in the state. According to entry 49 in the state list in the Consti-

tution, a state can charge cess on the land being used for mining. Moreover, according to the Mines and Minerals Regulation Act, a state that owns a coal belt is entitled to royalty. Coal cess, almost like direct tax, is calculated as part of the annual value of the land where a mine is located.

The revenue thus earned from cess, according to the West Bengal government, is spent on employment generation and welfare, and also on paying for the coal purchased. The burden is in fact passed on to the consumers. The state earned Rs 610.05 crore in 1997-98. However, the state government is yet to receive over Rs 1,000 crore on account of cess from the central government. Even the provident fund dues of the employees have not been paid.

After the hue and cry over the ICICI's decision to close down mines, the state government, however, reduced the coal cess to 25 per cent, acknowledging a loss of Rs 250 crore to the state exchequer. Yet the amount remains higher than the average royalty of 17 per cent levied by other states, and hence ECL coal remains the costliest in the country. So far, even the state government has not thought of ploughing the incomes from cess into the region through innovative planning measures.

The grossest flaw in the ICICI report is that it is cast on purely economic terms with the hidden assumption that better technological inputs will result in improved economic performance. At one point of the report, the ICICI does say that from the 'socio-economic perspective', it is 'not advisable to close down the mines under group IV category'. But there is nothing more on this topic as if the fate of nearly 72,000 people does not matter. Contrast this with the scene in Germany. That

TABLE 2: DIFFERENCE BETWEEN SAND STOWED AND COAL EXTRACTED

(Tonnes)						
Area	April 1995-November 1995		Difference Sand Over Coal	April 1996-November 1996		Difference Sand Over Coal

Source: J K Ropeways and ECL

country's coal production meets only 20 per cent of its total demand. Still, coal mining gets a state subsidy of more than 6 billion marks in the face of popular demand.

The ICICI report is full of such sweeping statements as: "The predominance of labour-intensive underground mining operations, coupled with the resultant low productivity, is clearly reflected in the low profitability of the operations at ECL". The report shows incomplete comprehension of both the problems it has set out to solve and the snow-balling effects that would be triggered by adopting the strategies suggested by it.

As an afterthought, the report mentions that the "option of phasing out these mines would not be practical from the implementation point of view". What does this signify?

It would seem that ECL is fascinated with machines and entirely impatient with human beings. Its apparent approach is to do away with people whether by displacing them in mining expansion, or by sacking them *en masse*, in an attempt to attain economic efficiency. This attitude does not sit comfortably with a public sector company. It makes even a layman suspect that ECL intends to dismantle itself.

In the wake of liberalisation, there have been subtle and not-so-subtle attempts from various quarters to attract private capital from within India and abroad to the coal mining sector. The ICICI report, instead of honestly delineating a plan of restructuring and revival, has acted as an instrument for the justification of mine closures. The coal industry itself is undergoing a restructuring and that CIL's priorities lie elsewhere is borne out by the fact that it is importing 25 million tonnes of non-coking coal from various countries like Australia, Indonesia and South Africa – another hasty and unnecessary measure.

TODAY AND TOMORROW

Recent developments are quite intriguing. For one thing, ECL shelved its intentions of mine closure and retrenchment for a while to work on a revival plan to prescribe a turnaround package for the company. Retrenchment was ruled out for the time being. However, since over Rs 4,000 million has been already invested in ECL since nationalisation in 1972-73, the question of any further capital infusion does not seem a possibility. All major trade unions in ECL and the Coal Mines Officers' Association, India (CMOA) have hailed the decision, but

the closure of some nonviable mines, most of them in West Bengal, is inevitable. Even with a popularised VRS, the impact on the economy of the Raniganj belt will be hard.

Over a recent span of a few months, moreover, the productivity of ECL increased to the tune of 19 per cent – an unprecedented event for this company. This has been made possible through improved motivation at all levels – from the general 'majdoor' to the general manager – and the trade unions as well as the officers' union have played a significant role in this turnaround. This alone is evidence enough that what has been lacking so far is proper motivation and human resource development, areas that have never been taken seriously by the ECL and CIL bosses.

The entire chapter has shaken the very core of the existence of the Raniganj belt – one of the better-off areas of West Bengal. It has brought into focus the old problem of non performance of the state sector and highlights several facets – some specific to the Indian coal mining industry and some specific to the region. In recent years, liberalisation of the economy has been viewed as a panacea, sometimes even at the cost of the national interest. It seems that the coal sector is all set to open up to foreign private capital since ECL is unable to find a solution to its problems – created largely by itself.

The ICICI report, looking only at the economics of coal mining, has intentionally or unintentionally fallen in line with the scheme of things at quite the right time. An example: nowhere has the report mentioned the cumulative loss to ECL from the underground void-subsidence-compensation cycle, leave alone measure it, thus creating the impression that closing the underground mines would be the final solution.

In its 25 years or so of existence, ECL has never thought of setting up its own research and development (R and D) establishment. It has at all times been lured by the hi-tech sophistication of coal mining in other countries. The results have often been disastrous. Machinery has been left unused, rusted machines have failed to perform, millions of rupees have gone down the drain. Unauthorised, informal coal mining is rampant in the region, and often goes on right under the nose of the mining authority. Sealed and abandoned collieries are broken open and coal from pillars and sidewalls is extracted without resort to sand filling. In open-cast mines too theft has become a fact of life.

The basic problem is that ECL has never tried to set its priorities right and never looked beyond immediate economic concerns. The environmental problems of the region, as a result, have reached crisis levels. On winter evenings, hundreds of thousands of knee-high stacks of stolen coal go up in flames along the streets and in residential yards. The smoke floats at eye level – as it is unable to rise against the heavy air – making a visitor to the area wonder how a human being can breathe such air. The dispossessed peasants take to 'illegal' mining. The mafia is more involved in illegal coal trade.

Thus, there are intricate environmental and human dimensions of the problems of the region, and a simple cost-benefit analysis is not adequate at all. Another grey area that ECL has overlooked is that human productivity is low because of lack of skills and poor health. Building up human resource potential has never been one of the company's strong points. The stress on open-cast mines at the cost of underground ones also needs closer examination. How far is the viability of open-cast projects real and how far only apparent because adequate measures of environmental protection are side-tracked? Finally, this whole chapter has once again brought out of the closet some old issues: the question of a state's right to earn revenue on its natural resources, coal pricing policy, etc.

Given a scenario of foreign private companies operating in the region, one can only try to visualise the shape of things to come in a limited way. There is no doubt that state policing to protect the environment and the rights of disadvantaged groups would have to be at a very high level. Given the state of Indian corruption any hope for such a state of affairs would be illusory. And given India's dismal track record in managing environmental matters through state initiative, one shudders to think what these private/foreign companies would do once they enter the coal mining regions. Many old inhabitants of the region have not forgotten the days of 'company raj', when the main objective of the small entrepreneurs was 'more hole, more coal'.

ECL has proved no different from its predecessors with regard to environmental matters. Instead of trying to clean up its act, it now wishes to liquidate itself and hand the region over to a new breed of profit-seekers. While transnational mining companies, forced by governments, follow very strict environmental guidelines on their home turfs, there is no guarantee that they would do so in India too. Remember Bhopal?

Community and Identities

Interrogating Contemporary Discourses on India

Surinder S Jodhka

The notion of community is being invoked not only by social scientists engaged in understanding Indian social and political processes, but also by parties on the right and the left in their mobilisation and in the official discourses on development law and common civil code. But in most of these discourses, the internal structure of the supposed communities invariably gets elided in favour of a notion of moral bonds and cultural authenticity.

THE decade of the 1980s in India will be remembered for many things. Apart from other changes and shifts, it was in the 1980s that the new social movements emerged in India. The 'new' mobilisations by women, farmers, dalits, tribals and ethnicities raised issues and demands that could not be easily understood or dealt with in the then dominant theoretical and political paradigm, the paradigm of development. They questioned the basic premises of the state-directed developmental programmes, being pursued with much enthusiasm in the name of welfare and progress. Coupled with other changes, the 1980s saw the erosion of the 'Nehruvian agenda'. This 'paradigmatic crisis' also provided a context for new debates on subjects like secularism, development and modernity, eventually leading to important theoretical shifts in social scientific enterprise and its research agenda.

Proinent among these was an increasing preoccupation with the study of social identities, such as nation, ethnicity, gender and caste. Questions of identity and culture had perhaps never been so important for the social science disciplines of sociology, anthropology, history or even geography as they are today. This new interest in identity is not confined to India alone. At the global level also the study of culture and identity have become major themes for research, particularly after the emergence of various kinds of separatist movements and ethnic conflicts in different parts of the world.

While these 'new' trends have definitely helped in opening-up fresh questions for research and politics and offer useful frameworks for social analysis, in certain instances they have also led to the revival of some 'old' concepts. 'Community' is one such concept that has been invoked rather frequently and often uncritically in a variety of contexts. Together with 'civil society', the categories of 'community' and 'identity' have come to dominate the social scientific discourses on India. The contemporary revival of 'community' is

perhaps best exemplified by the manner in which questions of environment, displacement, ethnicity, diaspora, human rights, and caste politics or even health are being articulated today.

The notion of community has also been invoked by an increasing number of social scientists who are critical of understanding Indian social and political processes through the western categories, particularly the categories that give centrality to the so-called 'rational individual'. Many of these scholars, sometimes also called 'nativists' or 'post-modernists'/'post-colonialists', have argued that there was a need to give some kind of political recognition to the fact that in the Indian society, community linkages and loyalties continued to be important in the everyday lives of the common people. For some recognition and revival of community was important because it could become a medium through which one could counter the growing violence and alienation in our society and protect the native cultural traditions. For others, recognition of community differences was important for a genuine democratisation of the Indian society. It was only through such recognition, they argued, that the process of homogenisation that was first initiated by the colonial rulers but was being continued by the post-colonial state as well, could be countered.¹ Sarah Joseph has recently argued that despite variations in their positions, the 'communitarian' thinkers in India, more or less, agree on: the advocacy of the politics of difference; accepting communities as legitimate actors in the democratic politics; and a project of giving voice to the subalterns [Joseph 1997:2517].

The new discourse of community is not confined to academics alone. It has permeated the ideologies of political parties on the right and the left, and is freely used to consolidate support for struggles against a variety of enemies, be it the multinational corporations, globalised media, consumer culture or in communalist mobilisations. The category is being extensively used in

the articulations of contemporary identitarian politics. Even in the 'official' discourses on contemporary India like those of development, law, or the common civil code, the notion of community is invoked rather frequently. 'Communitics' are being viewed as 'some of the most active agents of political practice' [Chatterjee 1998:282]. In most of these discourses, the internal structure of the supposed communities invariably gets elided in favour of a notion of moral bonds and cultural authenticity.

In order to examine and interrogate the contemporary discourses on Indian society, the department of sociology at the University of Hyderabad organised a national level workshop on March 19 and 20, 1998, where scholars from different parts of the country presented their working papers by taking up different contexts of the uses of the concept of community in identitarian politics as well as in other contexts. The papers presented could be broadly divided into two categories. In the first category were the papers that dealt with conceptual issues relating to the two concepts, community and identities. In the second category were the papers that took up specific contexts or case studies of various identitarian movements where the notion 'community' has been invoked as a central category.

COMMUNITY AND IDENTITIES: CONCEPTUAL ISSUES

In the opening paper on 'Conceptualising the Concept of Community in Indian Social Science: An Anthropological Perspective', Carol Upadhyia contended that community had played a central role in the development of sociological discourses on India. There had been a long tradition of 'imagining' India through the categories that constructed it as the oppositional other of the west. India was often seen as an example of *Gemeinschaft* (or the community) type of social organisation, composed of primordial bonds of blood, territory and culture. The Indian social institutions –

jati, village, religious sects – were often seen as examples of traditional communities. At the other end, the modern western society was defined as being characterised by individualism and associational institutions, the *Gesellschaft*. While much had been written about community/individual, east/west and other such dichotomies, Upadhyaya pointed out that there was yet another dichotomous pair embodied in this discourse which had rarely been talked about and which might actually be even more fundamental: the opposition between the realm of culture and that of economy. One of the forms in which this opposition between culture and economy appeared in the Indian context was in the 'caste vs class' debate of the 1970s where for both sides caste was defined as some kind of socio-cultural unit or an ideological system based on the religious system of hierarchy, and class was seen as an economic phenomena. Another problem with this conceptualisation of caste was that in this framework, castes or jatis were defined not only externally in terms of their position within a hierarchical structure but also internally in terms of relations of kinship and marriage, a kind of 'primordial' unit that came to be equated with community, which in turn was identified as the locus of cultural tradition and identity.

The outcome of this theoretical trajectory was the identification of 'culturally' defined groups (ethnic, religious, caste) as the authentic units of social organisation in India. The recent assertions by communitarian writers that the 'real' submerged community had supposedly been repressed by a non-authentic and all powerful state, itself a product of imposed and alien 'modernity', had given a new lease of life to a notion of community that had its roots in the older sociological tradition. This one called the substantivist approach to community in Indian sociology.

There was also another approach to 'community' in India, as Upadhyaya pointed out, a constructivist approach. According to this position, most of the communities that we see today and the identities on which they were based, were not survivals from the pre-colonial times but were the creations of colonialism. Following Foucault, many of the constructivists had argued that through its disciplining and authorising practices, it was the colonial state that created a civil society in line with the demands of governing and controlling large populations. One example of this tradition was Dirk's thesis on caste. According to him, Upadhyaya stated, the

colonial regime robbed the caste system of its former political base and reconstructed it as a primarily religious or cultural institution that came to be seen as the authentic basis of Indian society.

Much of the recent works on ethnicity and nationalism in other parts of the world had also moved towards a constructionist approach. Operating in a very different notion of culture, the recent anthropological works on identity had pointed out that it was no longer possible to presume that a social identity or tradition linked to a particular 'community' had an autonomous or authentic existence, and that it had been simply appropriated for political ends by an identitarian movement. Rather, traditions and identities were seen to be constructed in complex ways in an ongoing process of cultural production, which included politically motivated objectifications of culture, embodied in emblems of identity which represented the distinctiveness of the community or ethnic group. Thus, constructivists would argue, to understand the formation of any particular identitarian movement or social collectivity, one must look at its cultural specificities and the political and historical context in which it had arisen, and at the ways in which particular symbols or practices had been invoked and reworked by people in their strategies aimed at producing active political collectivities.

However, the constructivist position was also not free from problems. Taking on from some of the recent debates in American anthropology, Upadhyaya pointed to objections raised against the constructionist position. The constructionist position like the substantivist or the 'primordialist' notions of community, claimed to be located outside the identity politics and spoke from an objectivist/modernist stance. This raised questions about the politics of the constructivist position itself. There was no free market in the interpretations of the past. While on their part, the constructivists might be trying to argue against the tendency to reify communities and identities, the other side saw their theories simply as reassertion of the representational authority of scholars vis-a-vis indigenous groups. Further, by insisting on the fact that all identities were constructed, such a position tended to disempower those who were working within the identitarian politics.

Commenting on the Indian context, Upadhyaya contended that while the constructionist position was put forward for colonial discourses and practices as sources of modern identities, it had not yet been extended up to the present to examine

the ways in which such identities continued to be politically constructed. Also, she underlined the need for understanding the relationship between academic knowledge and the knowledge practices of the state or the social movements. Further, much of the recent literature produced by the communitarian scholars continued to work with the 'culture-economy' dichotomy assumption. There was a tendency to valorise community as an authentic social unit and a political actor because it was seen to belong to the realm of culture and was often counterposed to the supposedly non-community formations – state, market, class – that were by definition viewed as non-cultural and therefore non-Indian.

Another paper, 'The Eclipse or the Renaissance of "Community"' by Ravinder Kaur, also focused on conceptual issues. Travelling through a history of the concept of community, Kaur explored the relationship between 'community', civil society and identity. In much of the western classical evolutionist social science, 'Community', Kaur argued, was often viewed in positive terms, though simultaneously imagined as something that belonged to the past. However, within the western sociology, there was also a tradition that viewed community negatively. The Chicago school, for example, conceptualised city as a space devoid of community. Community, for them could be found only in the neighbourhoods inhabited by the new migrants from rural settings, in the ghetto and the slum. These communities were viewed as the survival of primordial values that could be potential sources of tension and violence in cities.

In the next part of her paper, Kaur pointed to the critical place that the nation state had come to acquire in the contemporary political discourses. Following Partha Chatterjee, she argued that capitalist society was able to ideologically reunite capital and labour at the level of the political community of the nation. The nation state defined itself in terms of an oppositional other of the natural and primordial community. This European idea of nationhood that privileged the nation as the only legitimate form of community over most of the other forms of communities and identities, Kaur argued, had been duly propagated in the post-colonial third world societies as well.

Further she pointed out that in much of the contemporary discourse on 'state and civil society', state was represented as despotic, overbearing and a site of control, while the civil society was viewed as the victim to be saved and protected. However, such an uncritical and romantic view of

the civil society and community, Kaur argued, could have its own problems. Civil society could also be a site of contention and competition. Communities, she argued, were not homogeneous entities; they consisted of a variety of groups differently and unequally placed within society. They constituted themselves through symbolic processes in order to claim space for themselves, in order to protect their privileges, structures of prestige or to prevent their annihilation. Also communities had two different faces. One, as it appeared to its members from inside; and two, what it looked from outside to others.

Through an exposition of some of the recent writing of Partha Chatterjee, Sashcej Hegde in his paper on 'Identities?' initiated a discussion on the question of modernity as a contextual/contested terrain. He quoted from Chatterjee that "one ought to question commonsensical notions about the existence of certain universally held values of modernity" and suggested that "modernity was a contextually located and enormously contested idea". "True modernity consisted in determining the particular forms of modernity that were suitable in particular circumstances". Chatterjee had underlined that "by teaching us to employ the methods of reason, universal modernity enabled us to identify the forms of our own particular modernity".

Production of a distinctly national modernity that was different and suitable to our circumstances was the cultural project of nationalism. Today in the age of globalisation, the tendency seemed to be more towards homogenisation and there seemed to be an emerging conflict between 'modernity' and 'democracy'. Thus, there was again a need to 'mobilise the courage' that marked the nationalist phase. One possible way of doing this, as Hegde cited from Chatterjee, was to "take a fresh look at some of the conceptual components that claimed to tie together local structures of community with territorial nation-states". One needed to "understand the structure and dynamics of mass political formations in twentieth century nation states". Further, it would be useful to think of a 'domain of mediating institutions between civil society and the state', a distinct sphere of what Chatterjee called, 'political society', a concept that could help us go beyond the traditional/modern dichotomy. Although community had a very tenuous place in the western liberal theory of civil society and state, "in the new political society of the east, communities were some of the most active agents of political practice". For Chatterjee the solution to

this problem was possible through the use of his concept of 'political society' which could enable us to understand our own specific form of modernity. This was an answer that emerged from within the project of modernity.

In his concluding remarks Hegde contended that Chatterjee's theoretical solution seemed to give much significance to the question of location (their vs ours). The problem however, was not "in determining historical inheritances, plainly not only a question of location, about whether there can, or need be, only one historical heir; but this is as much true about them as about us".

In yet another paper on conceptual issues, E Haribabu argued that the popular representations of the 'scientific community' as "an exotic group insulated from the wider society" had serious limitations for understanding the cognitive and social organisation of science. Following this he also made a general comment on the notion of community itself. In plural societies like India, he argued, representations of communities as distinct and unique world-views tended to fragment the society. It also undermined the possibilities of trans-community alliances. He pleaded that the social scientists needed to look at the internal differentiation among groups and 'communities' that could open up possibilities of alliances among those sharing similar material conditions for creative political action.

SPATIALITY AND COMMUNITIES

In his paper on 'Thinking Spatially about Communities', Satish Deshpande argued that despite its enthusiasm for the blurring of boundaries and the seamless implosion of locality into globality, the burgeoning literature on globalisation told us very little about the concrete spatial re-articulations effected by globalisation. An apparatus attuned to change, movement and incongruity could not help being relatively insensitive to the counter-pressure exerted by the resilient but unspectacular continuities present in every specific context. Moreover, the sharp focus on the local and global extremes of the spatial spectrum left blurred the intermediate levels of micro-region, region or nation state.

Thus, Deshpande suggested that there was a need to work against the grain of the globalisation literature in order to highlight the sub-global spatial processes involved in the formation of communities and the political harnessing of socio-cultural identities. The intermediate levels being the key to a grounded understanding

of contemporary spatial re-articulations, not all of which were well served by the omnibus label of 'globalisation'. Basing on the work he is currently doing on the 'Bombay Karnatak' region of northern Karnataka, and the city of Hubli, he offered two illustrations in support of his argument: the first emphasised on the raw materials and the social mechanisms involved in the fashioning of a cultural (in this case, regional) community; the second looked at the more active aspect of community identity and its recruitment for particular political agendas in the case of the flag hoisting controversy at the Idgah Maidan in Hubli. He also pointed to the significance of addressing methodological questions, such as, what could/should count as evidence for arguments in this area? How could such evidence be collected?

Commenting on the political harnessing of identity in the region and the Hubli town, he attempted a comparison of the spatial aspects of two Hindu communal campaigns, the Ayodhya (Babri Masjid/Ram Janmabhoomi) campaign; and the flag hoisting campaign at Idgah Maidan, Hubli. He argued that due to the specific spatial geography of the city, and the location of the Maidan, the underlying justification for the campaign in case of Hubli was less abstract (and hence more dependent on the concrete experience of the Maidan site) than in the Ayodhya case. He concluded his paper by reiterating the importance of intra-national, i.e. regional and sub-regional, levels in understanding the significance of globalisation. For it was only when we were able to compare how identities were formed/harnessed 'before' and 'after' globalisation that we could evaluate the difference made by this process.

'COMMUNITY' AND ITS MOBILISATIONS

As mentioned above, the focus of the workshop was on the ways in which the category of 'community' was being mobilised and invoked in order to articulate various forms of politics ranging from 'jehadist' mobilisations to environmentalist movements. Much of discussions in the workshop were mostly centred around, what Upadhyaya called, a constructivist notion of community.

A R Vasavi, in her paper on 'Narratives in the Re-Constitution of Communities', argued that in the contemporary political discourses on India, much attention was being paid to the increasing presence or emergence of 'communities' as 'political actors' in the public domain of the nation, and to the resulting community-state interfaces. The literature on the emergence

of communities as 'political actors' tended to assume their ability to contest and challenge dominance especially when their cultural and economic rights were threatened. However, the terms by which the communities were being reconstituted were not so simple in nature.

Narratives from the nation state, capital and culture combined in various ways and degrees to re-constitute communities. Vasavi argued that invariably the ability of different communities to challenge state dominance and capital narratives or to emerge as effective 'political actors' was dependent on the class and caste position they occupied in the national stage. While the communities located closer to the political and economic centres of the nation and those who enjoyed a high social and ritual position were able to galvanise and pit themselves against others in the public domain and influence the state or the capital to suit their interests, others who lacked political, economic and social bases remained marginal and silent despite significant re-constitution of their community structures and identities.

Vasavi also pointed to the variations in which communities experienced and engaged with the 'private' and 'public' domains. While the poor and marginalised had experienced an erosion of their private domains, marked especially by the intrusion of the state into their reproductive capabilities, productive activities and their cultural representation, the rich were witnessing a retrieval and expansion of their private domains. The public domain was also experienced differently by the poor and the rich. While the public domain was more accessible to the rich, its access was limited to the poor. The variations in the re-constitution of communities and their position *vis-a-vis* the public domain was also the undergrid of the constitution of the larger civic community.

She elaborated her arguments by taking up three case studies. First, the lingayats of Karnataka, who, in order to reconstitute themselves into a community were engaged in turning cultural images into sectarian icons; second, the nadars of Tamil Nadu, who had successfully reconstituted their community through 'a narrative of capital'; and third the spate of suicides by farmers in north Karnataka and Andhra Pradesh.

By privileging norms of productivity over ecological sustenance, independent success over collective growth, income generation over equitable distribution of resources, the agencies of nation state and capital had altered the logic of agrarian life. But unlike the nadars who could exploit these opportunities offered by the

expansion of markets to reconstitute their community, the marginal farmers became victims of the new narratives of the nation state and capital. Participation in commercial agriculture also meant a disengagement of these farmers from their previous social and cultural ties with the village. The loss of crop or indebtedness thus become individually and singularly-borne burdens. It was this form of construction and experience of crop loss that accounted for the spate of suicides by farmers in a region that had a history of frequent and prolonged periods of crop loss, from either drought or pest, but there were no records of suicides in the past. In the pre-capitalist agrarian settlements members of the 'community' came together at crisis times despite the glaring disparities prevalent in the agrarian structures. The increased integration of agriculture into the market economy had not only separated the economic sphere of life from the social and cultural spheres but had also made the latter subordinate to the former.

COMMUNITIES AND POPULAR CULTURE

Speaking from a feminist standpoint and placing herself on the side of those who had critiqued the 'nativists' and the 'communitarians', Sharmila Rege in her paper entitled 'Some Issues in the Conceptualisation of Popular Culture of Communities: The Case of 'Lavani' and 'Powada' in Maharashtra' contended that timeless and undifferentiated conceptions of the indigenous, recoveries of Indian self and communities had little for those pursuing a feminist and anti-caste political agenda. A boom in cultural studies in the north American academia had also led to a boom in studies of third world histories and cultures, characterised by a back-to-community approach. Invoking Sarkar, she pointed to how the class and material critiques of capitalism had been replaced by a critique of colonial discourse. The politics of recognition had come to replace concern for economic justice.

Empirically, her paper focused on a mapping of the shift in use of the concept of popular culture of communities, worked out through a historical account of the changing forms and representations of Lavani and Powada art forms of Maharashtra. The Lavani (an erotic folk form of dance) and the Powada (ballad) had persisted as popular forms of culture even as their content and form had undergone several transformations. These forms had been 'produced' for different sections in society at different times. Her paper traced these processes of production of the popular, of appropriation of the form for

social mobilisation by political groups and for identitarian politics across shifting sites of religion, castes, regions and lately diasporas. Through a teasing out of the internal hierarchies within the 'supposed community forms', her paper tried to underline the impossibility of a sharp demarcation between the alien and the culturally authentic and indigenous.

COMMUNITY AND CONSERVATION

In her paper on 'Cultural Conflict over Conservation: Eco-development in the Great Himalayan National Park, India', Amita Baviskar provided an account of the interface between 'community', state and the market. Covering an area of 765 sq km in Kulu district, the Great Himalayan National Park (GHNP) came into existence in the 1980s under the Wildlife Protection Act. A conflict had been going on in the area between the forest development bureaucracy and the local population over the villagers' rights to the resources within the park. Baviskar argued that the state discourse on conservation of bio-diversity and eco-development often pitted the local communities against wildlife. The local communities were invariably represented as the main agents of degradation and, in such a discourse, a transformation in their way of life was seen to be crucial for the transformation of the landscape they inhabited. The basic thrust of eco-development was to divert biotic pressure from the protected area. Though it was

THE THIRD SEX AND HUMAN RIGHTS

Rajesh Talwar: A Leading Lawyer at Supreme Court of India

The Hijras in India, Pakistan and Bangladesh represent a terribly marginalized minority community, to the extent that they are even ignored by human rights activists. The author has made a unique comparative study of the human rights abuses and legal problems, faced by the Hijras in Western countries and in India.

quite like other programmes of rural development, it began with the assumption that wildlife conservation was a priority that overrode people's rights to resources within the protected area. Thus, the underlying philosophy of eco-development of the post-independence state was not very different from the colonial rulers with regards to the rights of the local people over the forest resources. The local people invariably suspected the instrumental concern the state agencies showed towards harnessing indigenous culture by removing human pressure on natural resources and by creating alternative economic opportunities for them.

From the very inception, the GHNP project provoked a fierce controversy between the forest department and local villagers over the meanings and motives of eco-development. Claims about culture, resource use practices, worldviews and knowledge were central to this debate. Through the help of a non-governmental organisation (NGO), the villagers contested the assumption that local resource use was inimical to the objectives of wildlife management. The NGO argued that the traditional resource use by the local villagers was based on sound ecological principles that had always promoted, or at least maintained the interests of wildlife. By posing local management practices as superior to the scientific claims of the park authorities, the NGO could shift the terms of the debate away from a 'park versus people' confrontation to a scenario in which village and wildlife came to be projected as having common interests which stood threatened by a forest department bent upon disrupting the fine ecological balance between the two.

However, the notion of 'indigenous culture' that naturalised and legitimised claims of villagers to graze livestock or to collect medicinal plants inside the park also had other implications. In re-inventing themselves, villagers froze their culture in time and space what was fluid and varied on the ground. Villager's actual practices did not necessarily conform to the idealised notion of 'culture' that the NGO/villagers projected. While reasserting the role of indigenous knowledge and challenging the scientific hegemony of the forest department, people had been compelled to construct a new myth, glorifying the traditional culture and representing it as timeless and unchanging.

Further, all villagers were not equally enthused by such a representation of the village culture and community. The extent to which different villagers supported the political use of such a representation was

closely related to how they were responding to the opportunities opened up by changing institutional structure, particularly the market. With the expansion of road network and improved transport and communication, the economy in the region had undergone drastic changes. Horticulture had emerged as a lucrative alternative to subsistence agriculture. Enhanced link with cities had also fostered the collection of medicinal plants. Commercialisation of 'traditional medicines' had created a new market for the locally grown medicinal plants. Different species of plants began to be collected in bulk and were sold to the traders. While the local traders made profits, the increased demand for medicinal plants also fed the poorer families. The economic differentiation in the village community also influenced the political responses of different categories of villagers to eco-development. It was the poorer and middle income sections who provided the groundswell of opposition to eco-development. Even among these sections, the younger generation was more inclined to learning skills that got them jobs in the town and the servicing sector. However, even though the trend among the better off sections and the younger generation was towards the market, they appreciated the importance of 'indigenous knowledge and local culture' as a purely political symbol of strategic value in mobilising their community against the state.

CASTE AND COMMUNITY

As mentioned earlier, community is not merely a category that is being used in the social sciences, it has permeated even the popular political discourses and it is being used and deployed by various social movements to articulate their own self-identity. The discourse of community has recently become quite popular in the caste politics. The workshop had two presentations on the subject.

In his talk on 'Dalits in Search of Community', Gopal Guru offered some critical observations on the ways in which the discourse of community was being increasingly invoked in different articulations of the contemporary dalit politics in India. He emphasised the need of contextualising this increasing use of the concept of community. There was a need to ask questions like where such a debate was being carried out? Who was involved in such debates? And why was one involved in such a discourse?

Guru argued that at a time when there was a widespread process of the decomposition of communities, there seemed to be

an attempt at constituting dalits into a community from many different quarters. It was not only the colonial state that had vested interest in reconstituting dalits into a community. Even the modern Indian state had stakes in such a process. The Indian state was trying to constitute dalits into a 'dole receiving community'. This project of constituting dalits into a 'dole receiving community' also had support from some of those who claim to represent the dalit interests.

The community logic seemed to have become so overpowering that even if an individual dalit wished to escape it, he/she was not allowed to escape. The reservation policy, for example, was being seen as a community resource rather than an individual right. If a dalit had taken up a job under the reservation quota, the 'community' raised objections if he/she wished to change the job for the fear of it being de-reserved. The community logic had become so widespread that when a dalit male wanted to marry an upper caste girl, the 'community' opposed it and he was accused of distorting the communitarian resources.

D Parthasarthy in his paper on 'The Ambiguities of Categories: Community and Identity in the Kapunadu Movement' provided an account of the manner in which the discourse of community was used in the caste mobilisations in Andhra Pradesh. His main focus was on a movement that brought various 'backward' castes in state together. Though the immediate issue was an instrumental one: inclusion of these caste groups into the official list of backward classes for the reservations, the mobilisations also led to the formation of a new identity.

The movement took off in 1985 with the formation of Kapunadu Mahasabha bringing under its umbrella several cultivating caste groups with a similar position in the caste hierarchy, below the dominant castes and above the dalits. Attempts were made to imitate the mobility patterns of the kammars, by forging marriage alliances across regions and sub-castes and by setting up educational institutions. Though their success was limited, the rhetoric was primarily used to popularise the notion of community. Further, the movement was also directed against the overall dominance of the kammars in the coastal region. However, kammars being referred to as a community in the popular usage, Parthasarthy argued, kappus, by a dialectical process began to see themselves as an exploited and dominated 'community' rather than simply as a backward 'class'. The objective class

situation of the majority of the kappus, largely poor peasants and urban lower middle classes, alienated and insecure by nature, made them adopt the intermediate category of community rather than class or caste for self-identification.

The social movements and identities in the region reflected the absence of a developed industrialised capitalist economy and the consequent lack of a fully developed class structure. The ambiguity of community in Kapunadu epitomised the class location of kappus within an economic structure characterised by rural-urban capital flows, and the presence of the same dominant class in both rural and urban areas with similar patterns of social, political and economic behaviour.

RELIGIOUS COMMUNITIES

More than anywhere else, it is with reference to the religious groups, particularly the minority religions, in India that the term 'community' was deployed most commonly. This frequent use of the term to refer to the minorities has created a general impression that followers of the minority religions constituted homogeneous groups. Such an impression obviously has political implications. There were several papers focusing on various aspects of the 'religious communities' in India.

Rowena Robinson in her paper 'Fluid Boundaries: Christian Communities in India' contended that when viewed as groups at the level of sustained social action and interaction, lifestyle, custom and mores, the so-called religious communities, showed themselves as fractured if not, indeed sequestered entities, each having a different history and social trajectory. Thus, she argued, when we talked about the Indian Christians, we need to look at them as different communities, belonging to various denominations, each arising out of a particular social milieu and drawing on it in construction of its own identity rather than one single 'community'. Though there was a sense of association between separate groups due to their formation into larger bodies, distinctiveness marked the everyday life.

Drawing on regional traditions, different groups constituted their identity in unique and complex ways. There had been a variety of diverse ways in which the Christian communities had negotiated their relationships with the regional Hinduism and the local cultures in the drawing of group boundaries. The relationships of missionaries or converts to their own culture and to the state authorities; the relationship

of the converts with the missions, their own expectations of it – both social and material; their location within the particular regional socio-cultural order; and the character of their association with other social groups within that order were some of the elements that played important roles in these negotiations.

The constitution of community identity for different regional groups in relation to the cultural patterns within which they were embodied included idioms of caste, ritual and symbolic codes, ideas of kinship, patrimony and marriage. She elaborated in her paper on how the converts carried their caste identities with them even as they shed their religious affiliations. This was particularly the case when conversions took place on group basis. Further, those from the upper castes invariably refused to give up their caste entitlements and carried them across the 'religious' divide. She also pointed to the fact that the Christian missionaries had not always and everywhere unequivocally opposed caste, or all its implicated distinctions.

Pointing to some of the recent trends within the Indian Christianity, she emphasised that identities do not remain immutable and unchanging. Identities of Christian groups were being reconstituted today in radically new ways in the complex social and political environment. One such example was that of the coming together of the church as a whole in support of the political mobilisations by the dalit Christians demanding the reservation benefits as given to the scheduled caste Hindus.

There were two papers dealing with aspects of the Muslim community. As a part of his broader project on 'how people negotiated between large- and small-scale identities, and how they actively engaged in the construction/destruction of different identities', Syed Ali in his paper on 'Marriage, Caste and Muslims in Hyderabad' examined the different 'strategies regarding caste considerations in marriage' among the different groups of Muslims in the city. On the basis of his ongoing fieldwork in the city, he argued that in deciding who married whom, the importance of caste varied between different categories and groups of Muslims in Hyderabad. There were three major strategies regarding caste in marriage: first, to downplay caste and ethnicity in favour of other factors such as wealth and education; second, to allow caste to play some role in matchmaking process; and third, to treat caste as a predominant concern. These three were not always exclusive strategies. They, at times were also mixed

up. By examining the patterns of marriage, and the factors that went into deciding who married whom, he tried to show how the importance of caste varied between different categories and groups of Muslims.

He argued that caste among the Muslims in Hyderabad was something like a 'symbolic ethnicity', a kind of leisure time identity that had no socio-economic or political repercussions. The symbolic caste lacked any kind of semblance of community, of marriage circle, of boundaries.

In another paper titled 'Of Rushdie Affair and Community Descriptions', Rekha Pappu provided a map of the way media recorded the controversies around *The Satanic Verses*. Through a discussion of the newspaper debates, she examined some of the conceptual certainties that directed the debate primarily in relation to issues such as 'sovereignty', secularism and modernity. She tried to explore different moves by which the identity of the 'Muslim community' was fixed in the media debates.

The framework within which the question of human rights was raised in the debate tended to equate human rights exclusively with individual rights. Such an equation was premised on configuring the notion of faith or certain expressions of it as the obverse of modernity. By the very logic that had constituted the modern notions of freedom, faith became a matter of personal resolution and its public expression was thereby rendered absurd. Empirically her paper was focused on the debates that were carried out in the Indian context and on how the anxieties and aspirations were articulated and endorsed in the process of the Rushdie debate here.

COMMUNITY, IDENTITIES, POLITICS

As mentioned above, the issues of community and identities have acquired compelling significance today not merely because of the academic interests in these questions, but mainly because since early 1980s, the discourse of community had come to be used in the different types of identitarian movements. Most important of these being the communalist mobilisations that acquired a new dimension during the 1980s. Sujata Patel in her paper, 'Shiv Sena, Culture and Community', argued that it was no more possible to explain phenomena like the Shiv Sena through conventional methodological tools that looked at the way such a formation articulated its ideology. Such an exercise did not help much specially in case of the Sena because one often found contradictory versions being articulated.

She argued that in order to explain the consolidation of its social base in Mumbai, particularly during the 1980s, one needed to understand the connection between the restructuring of the urban economy of Mumbai and the rise of Sena. She asked for an ethnographic approach to understand the manner in which Sena carried out its political mobilisations. The arrival of Sena politics had shifted the locale of political mobilisations from trade unions to residential units. Therefore, one needed to look at the 'site of social organisation of the new economy'. These sites were those areas where the production of food, leisure and space took place. The 'vada pav' stalls, the video parlours, the club and bars, the paan shops, the retail trade outlets, the film industry, the cultural festivals all became sites for social organisation as well as for the construction and transmission of the meanings. Locality was often valorised in such mobilisations and was used for violent interventions. The politics of space reinforced the fetishism of locality and

one found a spurt of violent activities. Through this wave of political presence an incremental presence was posited rather than an expansion of a democratic space through redefining of the state-society relationship as it generally happened in identity movements.

In the concluding paper G Haragopal spoke on the 'The Rise of Hindu Fundamentalism: Brahmanism vs Bahujanism'. He dwelt on ideological and institutional aspects of the brahmanical Hinduism and the manner in which it had developed over a long period of time. While at the level of ideology, Hinduism appeared flexible and catholicist, at the level of practice, it tended to be rigid and obscurantist. The obvious proof of this was the caste system, which had 'an authoritarian hierarchical order and rigidly laid down boundaries and barriers for social interaction'. It was because of these oppressive practices that a large number of dalits had converted to Islam and Christianity in the past. In more recent times with the introduction of judicial reforms and some developmental programmes, dalits had begun to assert themselves in a different mode. The rise of bahujanism was a direct consequence of these changes.

Reflecting on the rise of the dalit identity movement in form of bahujanism, Haragopal argued that though this movement has had many positive effects, it still was to mature into an effective intervention for social transformation. On the positive side, bahujanism had been able to create new consciousness among the poor and had been able to mobilise them into effective electoral alliances. In the process, it had worked as a 'speed-breaker' against the Hindu fundamentalist politics. However, the excessive emphasis on identitarian politics had also created some knotty problems for the bahujan movement. It tended to overemphasise the caste question and tended to target the brahmins alone in its cultural struggle. There was a need for the bahujan movement to enter into broader alliances with other democratic movements for a viable transformative movement against brahminism.

As suggested in the title itself, the main thrust of the workshop was on critical interrogations of the contemporary discourses on India by focusing on the twin concepts of community and identities. While the participants were critical of the different ways in which the notion of community was being invoked by different identitarian movements as well as in some other contexts and most speakers used the term community in double inverted

commas, the mood was not one of dismissiveness.

Notes

[I gratefully acknowledge the help received from Sanjay Palshikar, Muthuraman, C Savarna, G Rajesh, Ramesh Bairy, Hema Malini and Sneha Sudha in the preparation of this note. Errors and omissions, if any, are obviously mine.]

- 1 In its most simple form, such a view could be found in the writings of Vandana Shiva and Ashis Nandy. Attributing the crisis in Punjab during the 1980s to the success of green revolution technology, Vandana Shiva, for example, argued that the violence in the state was a direct consequence of the developmental process experienced during the earlier two decades. According to her, the extensive use of 'external inputs' not only changed the ecological process of agriculture but also transformed the structure of social and political relationships. It weakened the earlier relationships based on mutual obligations among cultivators within the village and made them more and more dependent on the market. Thus for her, it was the breakdown of the village community that explained the violence in Punjab [Shiva 1991]. Similarly, Ashis Nandy has been arguing that much of the religious and ethnic violence in the contemporary south Asian societies could be attributed to the forced breakdown of the 'traditional community' by the dominant westernised ruling elite in these societies. In his defence of the 'traditional community', Nandy has argued that the project of development and secularism brought with it the callous impersonality and massification of market-driven societies that destroyed age-old institutions of sociability and community-living without putting anything else in their place. The traditional structures, as he would argue, were not simple and inflexible. Left to themselves, these community structures had more effective civilisational resources than the institutions of the modern state to resolve disputes, tolerate differences and allow for the development of a better-adjusted and more accommodative personality. The crucial institutions here were those that belonged to the 'little traditions' of local community life which were the product of many centuries of coping with social change [as summarised in Chatterjee 1998]. In a different way, scholars like Chatterjee and Kaviraj have argued for the need to recognise the significance of 'community' for understanding the political process in contemporary India [Chatterjee 1994; Kaviraj 1992; for a brief summary see Joseph 1997].
- 2 Sharmila Rege could not come for the workshop but had sent her paper which was read by Aparna Payaprol.

Non-Brahmin Renderings of Feminism in Maharashtra

Is It a More Emancipatory Force?

Chhaya Datar

THIS is in response to Sharinila Rege's paper, 'Dalit Women Talk Differently: A Critique of 'Difference' and Towards a Dalit Feminist Standpoint Position' (*EPW*, October 31, 1998).

I appreciate the author's efforts to chart in a comprehensive manner the recent history of dalit women's movement and its theorisation in Maharashtra. She has tried to locate this phenomenon and the theorisation in the context of the debate between post-modernist feminists from among black women and women from the third world and the standpoint theorists who believe that for a political action one needs to have a standpoint which is worked out in such a manner that it mediates the complex reality of hierarchies of colonial domination, race, class, caste and gender.

In critiquing the need for dalit women to talk differently Rege evolves a more forceful position and declares that the dalit theorisation and dalit movement should in fact lead the women's liberation movement which has remained constrained by brahminical framework in its attempt to unite all women regardless of their class and caste backgrounds. The present brahminical leadership of the women's movement universalises the experience of women by treating 'woman' as a category and promotes personal politics. Hence despite its claim of being more emancipatory than the working class movement led by the Marxist political parties it has ignored the experiences of dalit women and their special struggles around the oppression suffered under the different layers of hierarchies such as patriarchy within their own castes and the patriarchy of the dominant castes and caste domination which is represented often in class terms.

According to Rege, the major lacuna in the present feminist theorisation in India is that it has totally ignored a vital contribution by Babasaheb Ambedkar who highlighted the intrinsic relationship between gender, sexuality and caste "the absence of intermarriage or endogamy is the one characteristic that can be called the essence of caste". According to emerging dalit theorisation, all practices such as sati, treatment of widowhood, etc, were used for regulating any transgression

of caste boundaries. Babasaheb Ambedkar has located the specificities and varying intensities of women's subordination by caste and thereby draws our attention to the specificities of dalit women's subordination, both as 'dalit' and as 'women'.

Rege claims that by attributing dalit theory to Phule and Ambedkar it gives them more emancipatory force to intercept many layers of hierarchies at a time. Hence she argues that the dalit women's movement is not a narrow agenda of identity politics but on the contrary is interrogating current feminist standpoint which is brahminical and is also biased by middle class values and visions. Rege says for non-dalit feminists to adopt a dalit feminist standpoint position means sometimes losing, sometimes revisioning the 'voice' that we as feminists had gained in the 1980s. This process, she insists, can transform individual feminists into oppositional and collective subjects.

My first contention is that Rege has placed the current feminist debate within a narrow framework of feminist versus post-modernist streams. She did not present another vibrant stream, ecofeminism, which is attempting to revision the society where women are placed at the centre of natural and social regeneration. This stream consists of many overarching concerns such as ecological destruction, natural and social alike, apart from the usual concerns of colonial, class, caste and racial domination. Ecofeminists focus on caste- and gender-based oppression of dalit women, particularly the women who are losing their livelihoods in the rural areas because of displacement and environmental destruction. They are also questioning the unjust distribution of natural resources, which is one of main causes for mismanagement of natural resources.

Not only does Rege ignore ecofeminism, she criticises the autonomous women's groups and the left party-based feminists for ignoring the caste-based oppression of dalit women. She also takes issue with the post-modernists who talk of 'difference' but do not feel the need to convert multiple voices into social relations that can explain oppression. She tries to put forward her own dalit woman's standpoint in relation

to these two above positions. However, she ignores the fact that both these positions, one from the structuralist perspective and the other from the post-structuralist perspective are part of the same mainstream perspective which does not interrogate industrial, technological paradigm which encourages urbanisation and centralisation. These processes on the one hand create conditions for abolition of old hierarchies but on the other hand recast them into different categories in the changing context of globalisation and its response - fundamentalisation of politics. Although the dalit women's movement may not be part of narrow identity politics, insofar as it does not talk of the materiality of the majority of dalit, marginalised women who lose their livelihoods because of environmental degradation but focuses its struggle mainly against brahminical symbols, it cannot aspire to revisioning of society. It cannot become more emancipatory than the present women's movement.

Also, it is unfortunate that Rege targets what are really stray tendencies within feminism that are preoccupied with sexuality and sexual politics as though they define the second wave of the women's movement. She contends that issues of sexuality are intrinsically linked to caste and sexual politics without challenging brahminism results in 'lifestyle' feminism.

Rege alleges that feminists of left inclination have collapsed class and caste categories and rendered all women 'savarna',¹ and autonomous feminists who agree that dalit women need to take up leadership of the women's movement, do not feel the need to change their own subjectivity, i.e. to reinvent themselves as dalit feminists, leaving dalit women to fight their own cause. This is true by this assertion but the dalit feminist position does not become a superior standpoint. Those who regenerate both natural and societal resources can claim a standpoint and their knowledge becomes liberatory and forms a vantage point for this alternative standpoint. But dalit feminism as it stands cannot become a standpoint. It merely helps inform the liberatory knowledge of other movements, particularly the ecofeminist movement to expand its scope and richness.

The process of capital accumulation uses all kinds of cultural and material hierarchies to get cheap labour and recruit the marginalised population as a part of a reserve army of labour to push wages lower. Cultural revolt becomes useful for pushing the wages up. The demand for redistribution

of natural resources, and capacity building for managing these resources to produce livelihoods, questions the move to privatisation as the only option to the state control of natural resources. Community control and strengthening of local markets can create a sound base for negotiations with global markets if required. Rising fundamentalism at present is a response to the feeling of emasculation in the face of the global forces. A cultural revolt is necessary to counter these forces, but the revolt should get channelised in search of an alternative paradigm.

CURRENT WOMEN'S MOVEMENT IN MAHARASHTRA

I would like to present two arguments in the ongoing debate about women's movement being brahminical in the Indian context and particularly in the context of Maharashtra, where women's movement has been quite visible for some time. My first argument is that it is essential to understand the emergence of the second phase of the women's movement in its specific historical context to understand why the need was felt to assert anti-patriarchal struggle at that point of time. Besides, it is crucial to take note of different trends which emerged as the movement got developed, some of which have the capacity to be more holistic and can accommodate rich theoretical explanations offered by many other movements, such as dalit women's movement, nature-based cultural revival movements, and environmental movements.

In brief, the emergence of the second wave women's movement can be traced to 1975, when two events happened. The Committee for Status of Women submitted its report, 'Towards Equality' to the central government in 1974. It was part of the mandate by UN to all the member nations to prepare such a report for the first International Conference on Women's Issues to be organised in 1975 at Mexico. The revelation from this report was alarming – it highlighted through statistics collected through the government machinery that women's status was declining in every sphere. The International Women's Year celebrations also gave space to women in different form despite the declaration of emergency by the then Indira Congress government. Women in and around the left parties including those active in the Naxalite² movements and the unions were inspired to talk on women's issues. Academic women who had succeeded as individuals in their own fields, were startled by these facts pointing to the declining status of women.

A second significant event was the discussion of the Mathura rape case in 1980. This stimulated an analysis of patriarchy as structural violence embedded in the present relationship between men and women. There followed the issue of domestic violence in dowry deaths reported by the women in the media. Women's groups all over the country mounted strong protests. The movement gathered momentum during 1980s. It is important to understand these dates because some of the interrogatory questions raised in the paper by the author are factually incorrect. She has asked why the women's movement did not take up the issue of rape of dalit women in 1979 which occurred at the time of the renaming of Marathwada university in Maharashtra as Babasaheb Ambedkar university.

The author has blamed both the Dalit Panther Movement along with the women's movement for ignoring the specific oppression of dalit women. According to her both the movements started around the same period and followed a one-point agenda; Dalit Panthers pursuing the cause of dalit men and the mainstream women's movement fighting against patriarchy, assuming all women to be savarna. The Dalit Panther Movement started in the 1970s. 'One village, one water point'³ movement was also going parallel under the leadership of Baba Adhav, a non-dalit social reformer. Both these movements converged in 1979, for the demand of renaming of Marathwada university after Babasaheb Ambedkar. The reported rape of dalit women mentioned by the author took place around the issue of renaming of the university, i.e., in 1979. It needs to be noted that many women activists, feminists also joined the renaming struggle at that time. The women's movement had not at that point begun any analysis of violence yet. During 1975 and 1980 the focus was mainly the issue of discrimination in the wage rates and the legal rights at the work place, as many women activists had a left party background.

It was only at the time of the Mathura rape case in 1980 that feminists perceived women as controlled by men in all their life activities such as labour, reproduction and sexuality and that rape was used as an instrument of control by men. The left party women dubbed these feminists as radical feminists who stand 'against' men and want to divide the working class along sexual lines. It also needs to be put down on paper that Mathura was an adivasi woman in Chandrapur in Maharashtra. Another famous case taken up by women's organisations was the case of Ramezabee,

a Muslim woman, in Hyderabad. Hence it is not true that the women's movement never took up cases of rape or marginalised women seriously. In Chandrapur later in 1990 when savarna women attacked dalit women, the 'sampark samiti' (co-ordinating body) of women's organisations sent an investigating committee and publicised the issue in a big way.

The point is that the Dalit Panthers had been already arguing that their women's oppression was not only class-based but it was also caste-based. They reiterated the position long noted by Babasaheb Ambedkar, that dalit women are being sexually used and abused by the savarna men. Dalit Panthers felt it necessary to highlight this aspect because the left parties used to refer only to the class aspect of their situation. It was the natural mandate of the women's movement to bring out the patriarchal aspect in rape incidents against dalit women (particularly mass rape) carried out to humiliate and provoke dalit men. One has to remember that caste-based oppression has been more publicised in Maharashtra because of the Satyashodhak⁴ and Ambedkarite movements. It was imperative for the women's movement to inspire the high caste women, the brahmin women and force them to perceive their 'deprived' and hence 'dalit' status and to demystify their insulated, high ritual status.

It has to be remembered that in India, many women activists got radicalised on the campuses during 1970s but their feminism emerged after they started working with the labouring classes, either in unions or among adivasis, unlike in the west. Alongside their personal experiences of being dominated by their own colleagues and menfolk in the family, their inspiration for revolt against patriarchy also came from the powerful voices of the women of labouring classes. Rege has borrowed the analytic of the women's movement from Grant (1993). Grant's work is too narrowly designed to accommodate the concerns of the women's movement in India. Rege notes that feminism of the 1970s had developed in opposition to the left and borrowing from Grant cites three categories, viz., woman, experience and personal politics as central to feminist theorisation. Rege excludes many other trends in feminism in the north and in the world, which are more inclusive of many other issues and have departed from the conventional left analysis in a substantial manner. Feminism may be used narrowly by a few, to justify their personal lifestyle but the agenda of the women's movement is much wider and is based on collective identity.

It is one thing to say [Velaskar 1998] that for understanding dalit women's issues we need a more sensitive and fine grained understanding of patriarchal structures which takes into account the influence of variant social structures and notes the diversities rather than be content with the analysis of the secondary status of women as if it were a pancultural phenomenon; and it is another thing to claim that the dalit feminist standpoint which has emerged so far, from the work of dalit feminist intellectuals and the practices and struggles of dalit women, can be an alternative torch-bearing force for the women's movement. Here the argument is trying to collapse the levels of theoretical analysis, i.e., it copies the same act of collapsing the categories of class and caste, which the author accuses the left of doing.

Padma Velaskar has emphasised the difference between women of different caste groups in a strong manner. She writes, "In another very fundamental social sense also, the status of women of the lowest caste groups has nothing in common with and is in diametric opposition to women of the higher groups especially the twice born and higher groups. Thus to speak of common subordination of all women being 'dalit' is to mystify this crucial difference. In fact, women of higher castes are infinitely superior ritually and in social power to even men of lowly castes. Women are mute actors in the cultural construction and material operation of caste but are very dynamic actors giving substance and meaning to caste interaction." Thus in a status quoist situation her analysis stands valid, but not in the current dynamic situation where women's movement has already taken some steps to transform the subjectivity of individual self as well as to intervene in situations of violence and injustice against dalit women.

It appears that non-dalit women in need of cleansing their feeling of guilt of being born in the savarna castes are trying to put new 'goddesses' on the altar who can bless the women's movement in future. However, Rege warns us that non-dalit women should not leave dalit women alone to fight their own cause but 'should own their cause as our cause' and she assures us that the 'transformation of subjectivities is possible'. She asserts that only the dalit women can speak for themselves, a typical post-modernist stand which she herself has described as 'limiting'. However, at the same time she talks of the possibility of non-dalit women 'reinventing themselves as dalit feminists'. It is one thing to say that the dalit women should emerge as leaders and spokespersons to bring forth

forcefully the specific oppression of dalit women on the agenda of the women's movement. But it is another to say that to be able to claim to oneself the label of a real feminist, one has to forget the wider perspective of feminism which is a result of the confluence of many other movements such as environmental and Gandhian movements, and embrace solely the so-called dalit women's standpoint.

DALIT FEMINIST POLITICS

The second point one needs to discuss is what kind of politics is proposed by this standpoint. The claim of a separate standpoint made by the dalit women's movement fits into the present mainstream political scenario of bargaining within the given political framework. This new additional dimension to the traditional structure of caste-class relations has arisen because of the trend towards brahminisation/sanskritisation⁵ among dalit and OBC castes on the one hand and the unstable political atmosphere which encourages the bargaining for seats in the democratic processes of elections and power-sharing on the other. It brings pressure for consolidation of groups on the basis of caste identity for opportunistic purposes. In practice it means that men of the dalit and OBC castes strive for space and compete with savarna men within the present political and economic system.

I am afraid that the dalit feminist standpoint does not take into account the contemporary dynamic situation which encourages assertion of intra-caste patriarchy by the dalit men. In the present atmosphere, women's issues and women too are used as pawns to further political interests of parties and men who are in control of these parties. Issues like uniform civil code and women's quota in the parliament are taken up and treated in a manner not empowering to women but encouraging their dependence on men. Women are divided, not only by their class status but more fundamentally by their caste status, where women of the high castes are used by their men to symbolise the purity and the higher ritual status of their castes. Caste politics gets predominant and these divisions among women get underscored and the process of empowerment which should get heightened as a part of women's participation in the decision-making processes in public life, yields distortions of all sorts, recasting the patriarchal tendencies in a new mode.

A demand by some dalit feminists for separate quota for dalit and OBC women within overall women's quota of 33 per cent seats in the parliament has to be

analysed against this backdrop. Dalit men have never encouraged dalit women to represent them in the few reserved constituencies which exist. The parties representing dalit votes such as the Republican Party of India have never offered seats to dalit women while bargaining for seats with the other political parties. Dalit Panthers never took up women's issues in their revolt against brahminical culture during the 1970s. On the issue of women's quota in the parliament, dalit women are posed in a competitive situation against savarna women, encouraged by dalit and OBC men who want to divert the prospective competition aimed at them by their own women to savarna women.

AMBEDKAR'S ANALYSIS OF SEXUAL CONTROL

It is interesting to note that the relatively egalitarian culture of adivasis is getting more patriarchal as adivasi life is coming under the influence of the market institutions. Babasaheb Ambedkar's contribution explains the institution of control over women's sexuality, particularly that of high caste women who had some right over property in the pre-Vedic period and fear of this property getting transferred to the lower castes through marriage ties was responsible for these women being denied this right. This phenomenon is being repeated at present in the regions where adivasi population predominates. Adivasi women are denied property rights by the men of their own community, due to the fear that outside men are marrying adivasi women and will claim the land of these women which is supposed to be inalienable under the fifth schedule.⁶ Thus control over female sexuality as a means of retaining control over property is a typical patriarchal mechanism and is reported at present from areas undergoing transition from tribal communal life to the commercial economy. I regret that dalit women are not using this analysis to explain the phenomenon of growing internal patriarchy among dalit castes which are getting more and more stratified and those who have acquired nobility are emulating brahmin customs and practices. The growing incidence of dowry among dalit castes instead of traditional bride price illustrates this tendency.

At this point we need to take note of the point raised by Padma Velaskar: ...it is maintained that lower caste women were not secluded, since their labour was needed in the fields and survival. Many lower caste communities allowed divorce; and polygamy though permitted, could not be practised by those who could not afford

to support a large family. All these facts are left fragmented and disparate, and decontextualised from caste organisation and its operation; they do not provide an account of the actual structural position and status of dalit women and 'falsely convey a positive picture'."

I think this argument is in a way double-edged. The author argues and rightly so that all women have been lumped by the feminist analysis under the panculture of subordination by the patriarchal forces suppressing women in various sub-structures, but she also criticises the women's movement interpreting the differential norms governing dalit women as conferring autonomy on dalit women as compared to the brahmin women. I think what the women's movement is saying has to be understood as a subtext of the pancultural patriarchy, to exhort brahmin women to get awakened from their consciousness of superior position in a caste system. To demystify the strong myth of superiority, in the popular version of the movement, it is pardonable to assert that the women considered inferior in the traditional ideology have more strength and space than brahmin women. Ambedkar has shown the link between sexual control of women and property and material wealth in the case of brahmin women. A few dalit women like Baby Kamble are pointing out the danger of the elite dalit women initiating the brahminical mode and adopting brahminical customs and symbols (Speech by Baby Kamble at Mahad, on December 25, 1998, for the celebration of Bharatiya Stree Mukti Din).

DEAD END TO MAINSTREAMISATION

Another area where dalit men's movement is very strong and has not used its power to benefit its own women is in the unions of the public sector enterprises where dalit men have formed separate unions for the agenda of recruiting all the reserved posts. There too, not much effort of recruitment for women is noticed. These are all agendas mainly to mainstream the dalit population in the economy and polity.

However, one realises that there is a dead end to this road and now that dalit women have awakened and started demanding their right to the reserved posts, they are hardly likely to succeed. The recessionary processes at the global level, increasing competition among the nations for exporting goods produced by cheap labour, disinvestment in the public sector, promotion of economy based on markets and shrinking jobs in the organised sector and in the urban areas combine to produce

a discouraging scenario for the one point agenda of reserved posts. Ambedkar had exhorted the dalit people to migrate to cities and educate themselves. He wanted them to prepare for the modern society based on the processes of industrialisation and urbanisation, leaving their menial jobs with the stigma of impurity and untouchability. However, that vision is no longer valid. And at least a few dalit groups have realised this. Migration in the present context means living in the slums of the big cities and allowing the children to get criminalised in the absence of good schools and due to growing unemployment.

To create livelihood opportunities for millions of marginalised people it is imperative to think of an alternative development paradigm and assert the dalit voice in that forum. The fear of decentralised society scattered in the village communities is understandable because of the centuries of experience of social and spiritual marginalisation. However, in the historical context of the struggles and new ethos of democracy, equity, justice and sustainability, it is not possible for anybody to go back to feudal practices. Violence still plays a significant role in rural life but it is due to the assertion of oppressed groups for increased wages or demand for water and other natural resources.

LIMITS OF DALIT FEMINISM

I would like to question the validity of this dalit feminist standpoint as the only standpoint representing dalit women's voices. It is interesting to analyse the socio-economic profile of the dalit women leaders who have formed dalit women's organisations, since 1990s. They are the educated dalit women working in universities and in white collared jobs. Many of them are neo-Buddhist and the author has mentioned 'pardeshi' cautioning against the middle class neo-Buddhist leadership which could have politically limited consequences for the movement. It has to be also pointed out that these are all urban women, and it is not known from their writings and concerns how much knowledge they have about the issues of rural development apart from the issues of cultural oppression of the marginalised women.

Another criticism levelled against the brahmin women who form part of the women's movement is that they act as spokespersons of dalit women. Brahmin women always utilise opportunities of presenting data on dalit women, or research findings related to their specific oppression, which they could do because of their superior access to education and language

skills. But the same women do not make efforts to teach dalit women how to do research, how to represent the situation of dalit women in such a manner that they can come forward and occupy the dais themselves. Kunda Pramila Neelkanth, in her recent article in *Maharashtra Times* (December 23, 1998) alleges that the leaders in the women's movement want dalit women to behave as the masses who will sit on the floor and listen to their own plight articulated by the brahmin women under the plea that the illiterate dalit women cannot be effective on the stage by narrating their stories in such robust words. She argues that dalit women are no more going to tolerate this and would like to become their own spokespersons and leaders. Unfortunately, when the dalit women's organisations also organise their public meetings one finds that the educated dalit women are on the stage and use their illiterate women as audience (meeting co-ordinated by Vikas Vanchit Dalit Mahila Rashtriya Parishad on December 25, 1998, at Mahad which I attended⁷ and in fact act much less democratically than the women leaders in the movement who have become much more sensitive to participatory democracy and are alert against any imposition of ideas from any co-worker.

Another important aspect observed is that at present the phenomenon of dalit feminism is prevalent only among mahar women who have the background of the Ambedkarite movement and have migrated to the cities since the first world war when many dalit men got recruited in the British army. Also the peculiarity of mahar caste is that members of this caste had never developed any particular skill in the village 'halmiedari' ('jajmani' system) and acted mainly as village messengers. A few went into entertainment business of 'tamasha', i.e., dancing and singing. Hence it was easier for them to escape from the village obligations. They could migrate easily to the cities. Education is more prevalent among mahar women than among women of lower dalit caste groups. One notices that the liberated dalit-mahar women too are not trying to educate the unliberated women from other dalit caste groups. The cultural ethos which include ritual prayers on the dais are all Buddhist⁸ and may alienate other dalit women who do not believe in Buddhism. If the theory of difference is stretched further one can notice that there are different caste sub-groups and their oppression can be described in specific terms, but cannot be woven into separate analysis. The women belonging to nomadic or denoti-

fied tribes will fall into another sub-group which have nothing in common with dalit women.

ECONOMICS OF DALIT FEMINISM

The National Alliance of the People's Movement represents many movements of labouring people mainly working in the informal sector including fisherfolk working with traditional gears and crafts. They have shown concerns for the artisans and the people belonging to the occupation-based castes and recently had brainstorming consultations for what kind of livelihood arrangements they would have in the developing scenario of globalisation and dismantling of the organised sector and with unemployment.

One is not surprised at the total lack of reference to Gandhism and his vision which is being reinvented by several environmental groups and also ecofeminists. Although it is a well known fact that no dalit movements would like to explore Gandhian thought under any circumstances because of the well known differences between the strategies of the two leaders, it is imperative for anybody working in the area of rural development and building up of rural economy to understand what Gandhi had visualised 80 years ago and understand his concerns and postulates about following a path of development adopted by the industrialised countries. Dalit women need to erase their biases if they want to develop their theories of liberation.

The ecofeminist trend according to me can be called an alternative standpoint. It offers a fundamentally radical counter standpoint to any existing radical standpoint, including that of any variant of marxist standpoint. It positions reproduction at the centre of the human activity in all its three dimensions – daily reproductive activities to service human labour, physical reproduction which includes production, and social relations for which socialisation of children in moulding their cultural identities becomes an essential activity. The present capital accumulation processes are either commercialising the reproductive activities wherever they can afford, or externalising the same where cheap labour forms an important ingredient. These processes also encourage discounting of the future of mankind by unsustainable use of natural resources.

Any standpoint which predicts emancipation based on processes of industrialisation which requires non-renewable energy resources on a large scale, and fast-track development based on high-tech does

undermine the value of reproduction and regeneration. Unless reproduction becomes a central concern of society and a lifestyle is geared around that we cannot say that paradigmatic change has been envisioned. It means that the economy and polity both get decentralised. It also implies restructuring of office and factory hours, rescheduling of school timings and developing appropriate curriculum to appreciate historical struggles against caste- and class-based oppressions and exploitation. It also means that we need to identify technology which is more suitable for an ecologically balanced society based on equity, and sustainability in future.

It is desirable that dalit feminists are exposed to many other movements which would enrich them. They should not base their arguments with reference to feminism which encourages lifestyles or feminism which stresses only class exploitation of women and highlights wage discrimination. Cultural revolt is essential but it needs to be invoked in every aspect of daily life, as well as in the issues such as access to natural resources; water and land. Caste oppression started by denying access to these resources and hence there is a need to claim these resources instead of leaving them to the savarnas. This will help regenerate the ecosystem as well.

Notes

[An edited version of the paper presented at the Eighth International Conference on Maharashtra Culture and Society, University of Sydney, January 6-10, 1999]

- 1 Savarna is the term based on the vedic categorisation of the people in four 'varnas': brahmin, kshatriya, vaishya and shudra. The first three varnas are considered savarna, i.e., superior varnas. They do not observe pollution among each other as far as food is concerned. Shudras are the untouchables. The term 'dalit' was invented by modern untouchable writers to define their identity as oppressed and exploited. All the castes which are a part of the three varnas mentioned above are considered superior, though ideological leadership is given by the brahmins.
- 2 Naxalite movement had been spearheaded by young party workers and students frustrated with the established communist parties. They were influenced by Maoist ideology and wanted to bring about revolution by organising peasants in the countryside. The movement first started at Naxalbari in north Bengal and is called the naxalite movement.
- 3 'One village, one water point' was a slogan coined by Baha Adhav, a maratha who has been influenced by the ideology of Phule. One of the visible symbols of untouchability in rural Maharashtra was either a separate well for the dalit people or they had to wait to obtain water from women of the savarna castes who would

lift the water from the well and serve them in their pots. The dalit women were not supposed to touch the well. During the 1970s Baba Adhav took up this issue and waged a campaign to eliminate this concept of pollution of water. The slogan stood for the idea that for the villagers there had to be single water source for drinking.

- 4 Satyashodhak movement had its origin in the thoughts of Phule who was the founder of this movement. He raised his voice against the ideological and cultural domination of brahmins, which according to him got authority from the fact that they acted as mediators between god and the common men and women. They interpreted god's words for the common people. He asked the people, the peasants, the labouring castes to revolt against brahminical domination and also against the trading communities who exploited peasants by offering loans at exorbitant interest rates. He wanted the people to search for god, for truth on their own.
- 5 Sanskritisation concept has been developed by the sociologist M N Srinivasan. Social and economic mobility becomes possible for the lower castes and class people and they start emulating the cultural traditions of the higher castes. In the Indian ethos, this emulation is also towards brahminisation, i.e., accepting the brahminical norms including those of domination over women.
- 6 The fifth schedule of the Indian Constitution states that adivasi (aboriginal) land cannot be purchased by non-adivasi citizens. It aimed to provide security to the adivasis against any forceful alienation of land through moneylending and usurpation.
- 7 This was the second year when the December 25 was celebrated as the Bharatiya Stree Mukti Din (Women's Liberation Day), because of its connection with the event of burning of *Manusmriti* by Babasaheb Ambedkar in Mahad in 1930. Dalit feminists had given a call to the women's movement that March 8 remains the International Women's Day for which they had no objection but for Indian women burning of *Manusmriti* is a more meaningful event towards liberation and also it meant accepting Ambedkarite thought by the women's movement.
- 8 Buddhism was accepted by Babasaheb Ambedkar at a very late stage in his life. Conversion to Buddhism was a mass movement, and has provided a new identity to lakhs of dalit men and women since then. However, very few dalits other than those who belonged to the mahar caste embraced Buddhism as their identity. Thus at present it has remained restricted to the people in the Ambedkarite movement alone, who observe Buddhist rituals and prayers even in public meetings.

In a world full of options
It feels great to have made
the right decision

The Right Choice

Tax-free Monthly Income of 10.50% p.a. and Annual & Cumulative options at 11.00% p.a. for the first year.

UTI's Monthly Income Plan 99 (II) is a 5-year Plan tailor-made to meet your requirements. Take a look at the attractive features that make it your right choice.

Choice of 3 Options:

Monthly Income Option: Assured income @ 10.50% p.a. payable monthly for the first year.

Annual Income Option: Assured income @ 11.00% p.a. for the first year.

Cumulative Option: Income will be cumulated @ 11.00% p.a. for the first year.

Income distribution for the subsequent years/periods will be declared in advance in the month of March every year. Under all three options there is scope of capital appreciation on maturity.

Protection of Capital on Maturity: Guaranteed by the Development Reserve Fund of the Trust. However, the guarantee does not extend to repurchases after lock-in period.

Tax Benefits: Total tax exemption u/s 10(33) of the Income Tax Act, 1961.

Double Benefit for 54 EA Investors:

Investment made in the Plan is eligible for availing of Capital Gains Tax Exemption u/s 54 EA of the Income Tax Act, 1961 and income from such investment is fully tax-free.

Weekly NAV: Declaration of NAV on weekly basis.

Liquidity: Repurchase facility after 3 years at NAV-based price. Also, listing on the Wholesale Debt Segment of the NSE under all three options.

Minimum Investment: Rs 10,000/- under Monthly Income and Annual Income options and Rs 5,000/- under Cumulative option. No maximum limit.

For further details, contact your nearest UTI Office or Chief Representative/Agent

UNIT TRUST OF INDIA

13, Sri Vithaldas Thackersey Marg, New Marine Lines, Mumbai 400 020.
Tel: 203 1818 Website: www.unittrustofindia.com

PLAN OPEN : 27TH SEPTEMBER TO 30TH OCTOBER, 1999

Risk Factors: All investments in mutual funds and securities are subject to market risks and the NAV of the Plan may go up or down depending on the influence of market forces on the Plan's portfolio. Past performance is not necessarily indicative of future results. There is no guarantee of protection of capital for premature repurchases and the repurchase price in such cases will depend on the NAV. Monthly Income Plan 99 (II) is only the name of the Plan and does not in any manner indicate either the quality of the Plan, its future prospects or returns. Please read the offer document before investing.

INVITATION FOR RESEARCH PAPERS

ICAI Accounting Research Foundation

About ICAI Accounting Research Foundation:

ICAI Accounting Research Foundation (ICAI ARF) has been promoted by The Institute of Chartered Accountants of India for carrying out core researches in the areas of Accounting, Auditing, Finance, Fiscal and Corporate Laws, Capital Markets and allied areas.

The Objective for Inviting Research Papers:

The objective for inviting Research Papers is to encourage researches in the areas of interest to ICAI ARF. The secondary objective is to identify research topics on which full-fledged research projects can be undertaken by ICAI ARF.

Eligibility:

A member of The Institute of Chartered Accountants of India or a member of The Institute of Costs and Works Accountants of India or a member of The Institute of Company Secretaries of India or an individual holding a M.Phil. degree from any recognised university or an individual engaged in teaching in a recognised university/institute is eligible to participate in the competition.

Guidelines:

- Paper should be based on an empirical research or a theoretical research, carried out as a part of Ph.D. programme or otherwise, on a topic in the areas of Accounting, Auditing, Finance, Fiscal and Corporate Laws, Capital Markets etc.
- The paper should be original and must not have been submitted to any other competition.
- The paper should not exceed 25,000 words.

Prizes: Research Papers will be considered for awarding prizes in the following categories:

Gold Medal for the best research paper	A cash award of Rs. 25,000 with a gold medal and a certificate from ICAI ARF.
Silver Medal for the second best research paper	A cash award of Rs. 20,000 with a silver medal and a certificate from ICAI ARF.
Bronze Medals for commendable efforts (3 prizes)	A cash award of Rs. 5,000 with a bronze medal and a certificate from ICAI ARF.

Award-winning papers will be the property of the ICAI ARF and it will publish those papers in a suitable form. ICAI ARF reserves the right not to award some or any of the prizes listed above, if participating papers do not meet minimum standards. The decision of the ICAI ARF will be final.

Whom to apply:

The paper, an abstract of the paper not exceeding 1000 words and the bio-data of the researcher (two hard copies and a soft copy in MS word) should reach **The Dean, ICAI ARF, ICAI Premises, PO Box No. 7100, Indraprastha Marg, New Delhi - 110 002** latest by **15th December, 1999**.

Vol XXXIV Nos 42 and 43

October 16-23, 1999

The National Family Health Survey (NFHS), 1992-93 has generated not only reliable demographic data but information on family health characteristics at the regional level which had been unavailable so far. **3002** The NFHS has been a massive undertaking successfully covering all states and obtaining comparable data because of the uniformity of methods of collection and verification. **3081** A unique post-survey check has ensured the consistency of data generated by the NFHS. **3084** State-level demographic models so far in use take little account of interregional disparities within the state or similarities across states. NFHS data allow spatial analysis of demographic and health data which is necessary for understanding demographic transition. **3008** An estimate of the values of the proximate determinants of fertility for major states is useful for instituting policy level and programmatic changes nuanced for regional differences necessary for bringing about decline in fertility. **3033** The relationship between gender preference and contraceptive prevalence is not uniform across states and is far more complex than it has been thought to be. **3058** That economic factors alone do not determine the mechanism of fertility change is demonstrated by statewise analysis of NFHS data which indicates that only in Punjab is there the expected negative association between living standard and fertility change. **3041** NFHS data show that there are wide differentials in the economic conditions of the socially backward which prompt a re-examination of the policy of caste-based privileges. **3052** While the relationship between religion and fertility behaviour has prompted much inquiry, it is clear that socio-economic factors play a vital role, making for a dynamic and complex picture. **3047** Demographic data for Maharashtra present a complex and even ironic picture: While contraceptive prevalence is high and the state has one of the most efficient health and family welfare services, the birth rate has declined only marginally. **3063** The NFHS, while updating the demographic data, has not covered some crucial gaps in reproductive health status including maternal health status, morbidity and its correlates and the quality of care. **3075**

Voting for Vision

Even as the Congress vision of the nation is incomplete, under-determinate and inconsistent in theory, the BJP's model of the nation has potentially tremendous appeal to the caste-conscious, sanskritising Hindu masses. **2979**

State and Market

What is called for is a dynamic and bi-directional movement between the state and the market. The emerging new balances need to be better understood. **2990**

Goan Rout

The Congress rout in Goa is almost entirely due the party's lack of preparation and its unwillingness to recognise ground realities. **2983**

Precipitate Solution

While democracy in Pakistan may have been of the most corrupt kind under Nawaz Shariff, the unconstitutional dismissal of a duly-elected government by the military only postpones the process of democratisation. **2988**

People and Government

The response of people to local government verges on contempt of both performance and of processes of governance. How effective are our municipalities and panchayat institutions as instruments of local self-government which give an opportunity to people to govern themselves? **2984**

LETTERS TO EDITOR

Tribals and Missionaries

ON the subject of tribals and Christian missionaries Satyakam Joshi's article (*EPW*, September 11, 1999) is quite informative and objective. However, his conclusions do not address many questions that arise from his account. For example, the question of the impact of conversions on the tribal culture. On the one hand conservationists and protagonists of tribal ways of life seek preserving tribal solidarity and cultural practices, on the other conversions have, from his account, led to undermining tribal solidarity and tribal culture (pp 2669-70). How can this problem be solved? That the Constitution seems to confer the right to protect their culture on minority groups rather than individuals complicates the matter.

Secondly, secularism, in the Indian context, is interpreted as respect for all religions rather than mere toleration. Some Christian missionary activities in the Dand area, from Joshi's account, seems to teach people that their problems can no longer be solved by their own deities and that they should turn to Jesus Christ. According to him, "some denominations rely mainly on miracles to attract converts". This has led the converts to believe that "Jesus Christ is the ultimate and only god

for us...Non-Christian gods are mere stones and we have no respect for any of that" (p 2670). Though quite rational, this seems to run against the grain of secularism and would obviously hurt Hindu sensibilities.

Thirdly, Joshi seems to draw a distinction between tribal religion and Hinduism, a legacy of colonialism (pp 2669-70). This is debatable. Hindu religious practice (not *Dharmashastra*) has been broad enough to accept tribal worship of nature and the so-called non-sanskritic gods as quite compatible with Hinduism. In fact, in many instances these tribal goddesses and their worship have been adopted by non-tribal Hindus too. Therefore, is such a distinction valid? That all this does not in any way exonerate those who indulged in violence either in Dang or in Orissa goes without saying.

R S MORKHIANDIKAR

Aurangabad

Islam and Russia

SOBHA GAEKWAD's report on the Russian crime scene (*EPW*, September 18-24) is quite distressing. As a person who had been enthusiastic about 'glasnost' and 'perestroika', the news from Russia is not what one was expecting

after the reading of the vision of Mikhail Gorbachev in the late 80s. It appears too much hope was built on the potential benefits of the atheistic capitalist and western model of lifestyle and consumption pattern. There is a lot of unhappiness there. Muslims are not happy and they want to have a separate political system in the Caucasus. It is a sort of clash between the Islamic and un-Islamic forces that is going on in Russia.

Muslims along with others suffered a lot at the hands of the communists. One hopes that Islamic influence for the collective well-being of Russia will be realised as the degenerate and atheistic 'western' models will not be any good for either Russians or anyone else in the world as they are based on too much celebration/abuse of the body and the soul and faith in dead and mortal entities. It is extremely important that there is enhanced receptivity to the messages of Islam and the commands of the Almighty Allah that are respected as per the instructions in the holy Qur'an. This is the only way to have a more civilised and compassionate society and just world order. Militant Islam appears to be just a reaction against such a backdrop of crime, immorality and hedonism in non-Muslim societies.

Also Islam provides the best framework for rationalising the consumption of exhaustible resources as more and more Muslims and new Muslims establish prayers/salat five times a day all through the year. We can imagine the impact on consumption levels. Observance of Islamic laws and practice will be good for the collective well-being of all of us. Following Islam is the only and the best way for ensuring good living conditions on the planet and then after death in the hereafter. There is no need to reject the existence of God. Marxism was a reaction to the excesses of the church. An atheistic outlook is not needed for doing science. Science is about knowing the creation of the Creator. It can be used with faith in Islam in the best way. We need to promote more vigorously the culture of prayer and thanksgiving for the Almighty rather than the atheistic Darwinian doctrine of the survival of the fittest as the latter reinforces the visions of nuclear and ecological disasters.

Nation States: Beyond and Within

EAST TIMOR's secession from Indonesia, formalised by Indonesia's parliament last week, shows the effect that globalisation has on national and international politics. Composites of a number of collective identities whose harmonious coexistence cannot be taken for granted, must draw the right lessons or pay the price. East Timor is a relatively small place, populated by one million people. The human resource capabilities of the new island would not compare with those of a medium-sized city in Indonesia. Yet that small place has now become an independent country. Is such autonomy viable? If it is, why should not large site states break up into more homogeneous smaller each sovereign and autonomous? If autonomy such small regions and populations is not viable politically or economically, why do demands for such autonomy expand and find support from the international community?

There is not much dispute about recent phenomena, that evolution along with the development of capitalism. What will happen as nation states as capitalism evolves further along the path of globalisation? This is uncharted territory. East Timor perhaps marks the blurred beginnings of the needed cartography, although with the different degrees of voluntary pooling of sovereignty by nations such as in the European Union and in supranational organisations like the World Trade Organisation.

There is reason to believe that globalisation itself promotes localisation, taking away the monopoly of the nation state and distributing it not only to supranational organisations but also to sub-national entities. A key feature of this kind of globalisation is the penetration of capitalism into the domestic organisation of production in countries that get integrated into interdependency. The instant interlinkages, naturally, would be different from those obtained from the interaction of capitalist metropolises and pre-capitalist colonies in the past.

When all nations act according to the same set of rules whose normative authority stems from supra-national organisations and agreements, the enforcement of national rules across its regions becomes proportionately redundant. This weakening of national authority, in combination with the strengthening of local resources, produces strong regions and cities. These regions and cities compete with other regions and cities not only in their country but also outside to attract investment and talent. We see this when Gujarat, Maharashtra and Tamil Nadu woo, with competing incentives, the same prospective foreign investor who finally succumbs to the charms of Hong Kong.

The loosening of national ties and the strengthening of local resource bases, along with the availability of supra-national rule-keepers, gives new energy to regional aspirations for autonomy.

Should such moves to autonomy be viewed with suspicion or disfavour? A possible objection could be from the standpoint of the desirable goal to which humankind should move: humanity making collective, optimal use of its habitat, the entire planet, transcending divisions of race, religion or nation. Creating fresh divisions of a national kind would appear to be a step away from rather than towards this goal. But this objection does not really hold in the cause of localisation stemming from globalisation precisely because globalisation is the route to unsegmented humanity. And the fact is that in some cases, regional autonomy even to the point of secession does little to lower the welfare of either those who secede or those seceded from. When the Czechs and the Slovaks decided to call it quits in Czechoslovakia, neither emerged the loser. If, hypothetically, Scotland were to become independent, it is unlikely to lower the welfare of either the Scots or of the English.

But this does not mean that little East Timor necessarily enhance welfare. What enables a community of people to live together productively and in harmony is a set of social institutions, apart from physical infrastructure. Developing the needed social institutions – of law and order, health care, education, markets, civic structures and civic sense, unions, civilised forms of negotiation and grievance redressal, governance, literature, etc – calls for a great deal of effort and resources, available only from the pooled contributions of large collectives. Where such institutions are well developed, autonomy might well be viable. But where such institutions are as yet only emerging, autonomy might disrupt rather than enhance development. In other words, the desirability of regional autonomy is a contingent affair.

But the fact remains that there is support, local as well as external, for unviable or costly autonomy in many parts of the developing world. We need to ask why. Local support for unviable autonomy derives from repression. If a community is denied the space it needs to articulate itself with dignity, it will prefer secession and disrupted development to continued denial of rights. External support comes from the quest of the established world powers to retain their hegemony by weakening potential challengers in the developing world as well as from the related but distinct tendency for human rights to displace national sovereignty as the guiding principle of international relations. Countries like China that are powerful

enough, militarily and economically, to ward off intervention might resist such tendencies with some success, but the rest would not.

The strongest armour against disruptive demands for autonomy for a country like India is unalloyed democracy. A democratic polity that allows communities to evolve as they choose and resolves conflicts without the use of force will give no space for popular demands for unviable autonomy. The Indian Constitution does provide for such a political framework. The danger is from those who wish to revise the Constitution, give primacy to one identity and subordinate the rest. Identities that are sought to be oppressed will, instead of being beaten into submission, find sustenance from external support and demand autonomy, disruptive or otherwise.

If Indonesia had had a democratic political practice that had allowed East Timor development on its own terms, it is unlikely that one-half of an island in the Indonesian archipelago would today have become an independent state. Internal democracy, it would appear, is a prerequisite of successful global integration.

MAHARASHTRA

Fractured Verdict

THE peculiar nature of the fractured verdict delivered by the electorate forced a near deadlock on the formation of government prompting the governor to issue an ultimatum. The fact that the parties could present the governor with a viable combination only just before the ultimatum drew to a close is indicative of the tenuous nature of the alliance of the Congress and the NCP in charge in the state. With the SS-BJP alliance securing 125 seats, the Congress and its allies 79 seats, and Sharad Pawar's Nationalist Congress Party (NCP) and its allies 62 seats, any attempt to reach the mark of 145 seats for government formation necessitated a re-alignment of pre-poll arrangements in the light of post-poll scenario. Interestingly, though Pawar's NCP has performed well below the expectations in both the Lok Sabha and assembly polls, thus reducing the party's bargaining power, its band of 58 MLAs assumed crucial importance and more or less directed the course of action.

An analysis of the poll outcome clearly shows that the success of the SS-BJP combine in improving upon its previous Lok Sabha tally and in more or less maintaining its tally in the assembly, is singularly due to the split in the anti-alliance vote between the Congress and

the NCP. Though the partywise voting percentages for assembly elections are not as yet available, the partywise vote shares available for the Lok Sabha elections underline the salience of this single factor. While the Congress and the NCP, along with their respective allies, secured an estimated 35 and 23 per cent votes, resulting in paltry 11 and eight Lok Sabha seats respectively, the SS-BJP alliance, in spite of a drop of 4 per cent from previous 41 to 37 per cent, was able to corner 28 seats. The NCP caused more damage to the Congress electoral prospects in the Lok Sabha than in the assembly polls. As a result, though the Congress was reduced to its worst tally of Lok Sabha seats in Maharashtra, it nevertheless succeeded, in the assembly polls, to emerge as the single largest party, way ahead of the NCP. Yet, the division in the Congress vote affected the three factions of the RPI and the Bahujan Mahasangh severely, as they were able to win two of the 10 allotted Lok Sabha seats and just four of the 65 assembly seats they contested.

Contrary to the prediction that the NCP would cut into the Sena base, the latter has benefited more than the BJP, especially in Vidarbha, from the division in the anti-alliance vote. While the Sena won all its four seats, the BJP emerged victorious only in two of the remaining seven Lok Sabha seats in Vidarbha, despite the fact that the Sena polled the lowest votes in the region. Clearly, the presence of the NCP which polled 11,46,000 votes, the third highest in Vidarbha, and yet failed to win a single seat, has proved more advantageous to the Sena than the BJP in their respective constituencies. As a consequence of the NCP, not only has the Congress, despite garnering largest number of votes in Vidarbha, the same tally of seats as that of the Sena, but it also had to suffer the fate of losing its hitherto invincible Lok Sabha and assembly constituencies of Ramtek to Sena upstarts. Failing to carry much of the Congress vote with themselves, the NCP candidates instead of defeating the Sena candidates enabled the latter to coast to a victory with a margin of 40-60,000 in constituencies such as Buldhana, Amravati, Washim in Vidarbha, Parbhani, Aurangabad, Osmanabad in Marathwada, and Kopergaon in western Maharashtra over the Congress candidates. A similar situation prevailed elsewhere with the BJP candidates notching narrow victory margins of 4-13,000 in Mumbai (south), Mumbai (north-east), Dhule and Bhandara, and comfortable margins in Ahmednagar and Pune over their rival Congress candidates.

Against this backdrop, victories registered by the Congress candidates in

Warananagar, Chandrapur and Yavatmal, though narrow, are remarkable, especially in Warananagar and Chimmur (won by BJP) where NCP's high-ranking leaders Datta Meghe and Prakash Patil were pushed to third place. Though the victories of Congress stalwarts like Shivraj Patil (Latur) and Sushil Kumar Shinde (Solapur) were expected, the victory margins attained by Vilas Mhatre (Murtumbar, Nagpur) and Prakashbapu Patil (Sangli), in face of strong opposition were outstanding. The victory of Prakashbapu Patil, son of former chief minister Vasantdada Patil, is of special significance not only for its victory margin of 1,61,000 in the sugar belt known to be Pawar's stronghold, but also for being representative of an electoral trend in Sangli district which disrupted Pawar's calculations at the assembly level. Wherever the NCP's Lok Sabha candidates have won, whether in Baramati, Khed, Satara, Karad, Kolhapur, the assembly seats falling within these Lok Sabha constituencies have also gone in favour of the NCP. The defeat of Congress strongman Prithviraj Chavan in Karad can only be explained by the strong winds blowing in favour of Pawar in nine out of 10 assembly seats of Satara within which Karad Lok Sabha constituency falls. In Sangli district, however, the NCP was able to win four out of 10 assembly seats indicating a trend in favour of Congress both at assembly and Lok Sabha levels. The reason for this anti-Pawar trend is not difficult to discern as Pawar was the one to have pulled down Vasantdada Patil who hails from this region, and his government in 1978 to install himself as chief minister. So strong appears to be the anti-Pawar sentiment here that it not only resulted in defeat of two Janata Dal (S) heavyweights Sambhaji Pawar and Sharad Patil, aligned with Pawar's NCP, in Sangli and Mira assembly seats respectively, but also the sugar baron and NCP candidate R R Patil scraped through in Tasgaon assembly constituency with a margin of less than 4,000 votes. Thus, far from gaining a majority across the state, Pawar's NCP was unable to establish its supremacy even in its bastion securing only 50 per cent of Lok Sabha and assembly seats of western Maharashtra.

The SS-BJP alliance have secured 11 assembly seats less than its previous tally in 1995 and significantly, 10 of those losses were in its heartland, the Mumbai region. Even the alliance's success in the Mumbai-Konkan belt, as elsewhere, is by default. The Sena's victory with a high reduced margin of 90,000 in its strong hold, Thane, in the Lok Sabha election can be attributed to the substantial split in its opposition vote. There are very few seats won by the SS-BJP alliance, such as

Mumbai(north), where the alliance bask in its own glory.

PAKISTAN

Asking for It

ONCE the suddenness of the national overthrow of the Nawaz government has worn off, it is the apparent patience with the civilian government which becomes of significance. The question to be asked perhaps is why Pakistan's military rulers do not remove Sharif but why they had to wait so until now, even with what might be termed considerable provocation to the elected government and party. This is not to despair over the country's polity to sustain a democratic parliamentary form of government but to acknowledge that Pakistan is a state of political flux, muted but nevertheless quite well-defined over the year. Sharif's own actions – down with the judiciary, his curtail the powers of the press, summary dismissals and appointments made for the elites' growing disenchantment with his government.

Elected in 1997 on a wave of popular support, Sharif and his party commanded a majority in the National Assembly, though not in the Senate. Set out to be different. The curtail of the president's powers to dismiss an elected government was an important change ensuring the longevity of parliament. This is what makes the current overthrow and dismissal of the elected government unconstitutional, while earlier actions were not. Soon, largely on the supposition due to the collective failure of the polity in dealing with its power in a democracy, Sharif began to be concerned with amassing power in his own hands, especially power in the army. Having demonstrated this by dismissing two naval chiefs, he never failed to carry the army with him on the issue of opening talks with India on the celebrated bus-ride and the 'King of the border'. And in Kargil, he never went before the conflict began, engineered a withdrawal ensuring the ignominy squarely settled on the army instead of the government.

The army in Pakistan has been well-documented and untiringly written about, commands a respect even among those who regard themselves as liberal elite. That was why, for instance, the dismissal of a relatively secular, former military professional like chief army staff Jehangir Karamat upset all sections of

the elite. When general Musharraf took over, Sharif appears to have taken great pains to slight him: he refused to confirm him as chairman of the joint chiefs of staff until recently, when he was given a two-year extension; he appointed a party loyalist as chief of the Inter Services Intelligence without consulting Musharraf. But unlike Karamat, Musharraf had a power base of his own both in the army and because of his links with the Taliban. It is a moot question whether he would have taken the extreme step of assuming control if Sharif had not attempted to arrest (or worse, assassinate) him. The summary arrest of well known journalist Najm Sethi, reportedly on the advice of the ISI chief, was about the worst thing that Sharif could have done, and it lost him whatever sympathy he may have had among those who wanted a democratically-elected government to survive.

It is a distinct possibility that the Sharif government was going under anyway, without help from the military. The build-up of political opposition to him and probably pressure from donor countries had already prompted Sharif to announce a possible preponement of elections. In a more mature democracy, such disenchantment spilling out into the streets would have built up gradually and would have been articulated politically on the floor of the elected assembly where Sharif would have been forced to quit and/or call for fresh elections. Democracy, it would seem has to be grounded differently in different places. In a society where the modern elite

is mostly a part of the landed classes with little development of the industrial classes and in the countryside feudal remnants have strong roots, democratic practice and the process of building democratic institutions and processes will need to be viewed afresh.

As things are, while Musharraf has not declared martial law, he has placed the constitution in abeyance and forbidden the courts to pronounce any judgment against the chief executive or those working on his orders. There is apparently no censorship of the press and this should mean a lot if indeed a democratic polity is to emerge through discussion and debate. In the currently prevalent mood of frustration and despair among the Pakistani educated classes, this sadly seems unlikely.

Geopolitical developments do not seem to favour a long spell of military rule in Pakistan. International anxiety about peace in south Asia and eventually de-nuclearising the region is not exactly conducive to support for military dictatorships in one of the countries of the region. With a pro-nuclear government in power in India there is little manoeuvrability. However whatever role geopolitics plays in determining the length of Musharraf's rule, in the interests of the future of democracy in Pakistan it is imperative that all available space for debate be utilised to mount a challenge to the Musharraf regime before it puts down roots, and to erect lasting, effective barriers to future attempts at military take-over.

NATIONAL ACCOUNTS STATISTICS OF INDIA 1950-51 TO 1996-97

Data for 47 years in each of the 40 revised and updated table series on different dimensions of national accounts aggregates are presented. On state domestic product, for the first time statistical series on both net and gross SDP in respect of all 25 states and three union territories for 17 years from 1980-81 to 1996-97 are available. Descriptions of the concepts involved and methods and procedures of data compilation adopted have been further expanded; likewise the extensive references to the analytical literature on national accounts and related literature.

CURRENT STATISTICS

IPW Research Foundation

The steady decline in the current account deficit in the post-reform period has been the result of slower growth in imports and a sizeable inflow on account of invisibles; export growth has remained sluggish. The largest contribution to net inflows has come from private unilateral transfers which include the contra entries for gold and silver imports by returning Indians. Since the beginning of 1998, there has been a decline in foreign investment flows.

BHARAT FORGE

Well-Timed Modernisation

BELONGING to the Kalyani group of companies, Bharat Forge is engaged in the manufacture of steel forgings, finished machined crankshafts, front axle assembly and components, and other products mainly for the medium and heavy commercial vehicle industry. With the industry witnessing difficult times over the last two years, there has been an adverse effect on the company's performance.

Consequently, in 1998-99 Bharat Forge posted a 20.5 per cent drop in net sales over the previous year. Though operating profit declined by 10 per cent, the company managed to post a 5 per cent increase in its bottom line, helped mainly by a drop in interest charges (down 7.3 per cent), and a much lower net non-operating loss as compared to the previous year.

The drop in net profit can be attributed to the company's efforts to restructure its debt burden. In fact, the company reduced its total loan funds from Rs 462 crore to Rs 396 crore, representing a drop of 16.7 per cent. Also, the proportion of long-term loans to total loans has been increased with the company deciding to reduce its dependence on expensive short-term funds.

Bharat Forge is now installing its second 16,000 tonne Weingarten forging press line which will help it cater to the enhanced demand for its products from domestic and international customers. With this, the Kalyani group company will become one of the only two companies in the world to have two 16,000 tonne forging press lines. The company also plans to raise funds in the current financial year through a combination of preference shares (Rs 40 crore), non-convertible debentures (Rs 100 crore) and term loans from financial institutions and banks (Rs 100 crore) in order to fund a modernisation programme, normal capital expenditure and also for augmenting long-term resources.

As part of the restructuring process, Bharat Forge has reduced its exposure in its financial services division by Rs 105 crore and also brought down its exposure in group companies to Rs 17.3 crore as compared to Rs 59.7 crore in the previous year. It has reduced its stake in Kalyani

Lemmerz, its joint venture which manufactures wheel rims, from 75 per cent to 15 per cent. The move brought in Rs 68 crore which the company ploughed back into manufacturing activity.

Meanwhile, for the first three months of the current year, the company has improved its performance. While net sales increased by 26.2 per cent over the corresponding period in 1998-99, net profit more than doubled from Rs 7.2 crore to Rs 16.1 crore. Interest charges too declined by 20.7 per cent.

Over the long term, with the Euro I and Euro II emission norms necessitating better quality of forgings commensurate with the requirements in the developed markets, demand from OEM's for quality components is expected to rise. With the company investing in Weingarten forging press lines, it is well-placed to take advantage of this opportunity.

The company's stock presently quotes at around Rs 207 on the bourses, discounting its 1998-99 earnings by 21 times.

COLGATE PALMOLIVE (INDIA)

New Products

Colgate Palmolive (India) has been witnessing a virtually stagnant bottom line over the last three years. The year 1999-2000 saw the company buckling under the strain with net profit declining by 43 per cent over the previous year. While net sales were lower by 1.7 per cent, the company's operating profit fell by 36.4 per cent over the same period.

With the decline in agricultural production, rural spending declined sharply and affected demand for fast moving consumer goods. The company claims that its profitability was also affected by the sustained high level of investments in strategic infrastructure, new product launches and brand building. New products launched during the year under review include several technologically advanced oral care products which have been made available at affordable prices.

Meanwhile, for the first quarter of 1999-2000 Colgate Palmolive has improved its performance, notching a net profit of Rs 12.1 crore as compared to a net profit of Rs 8.5 crore in the corresponding period last year. Sales improved by 21.9 per cent over the same period.

During the first three months of the current year, the company also revitalised two major products, namely, the core brand Colgate Total Cream and enriched Super Shakti, a Palmolive Naturals soap which has been competitively re-positioned in the popular segment.

After long a controversy over the acquisition property, Colgate Palmolive is now planning to sell and lease back the said property where its, suburban headquarters and research centre are located. It had signed a deal with the Hiranandanis for 1.2 lakh sq ft of built-up premises in the Powai complex in Mumbai for Rs 37.8 crore in September 1997, and is now looking for a long-term lease for the premises it currently occupies.

Apparently the tug of war for market share between Colgate Palmolive and Hindustan Lever has reached an impasse, with another competitor Balsara Hygiene making a dent in the market of both Colgate and Hindustan Lever. While Colgate presently claims it has a market share of around 5 per cent, Hindustan Lever claims to have a market share of over 35 per cent.

The company's share presently quotes at around Rs 230 on the bourses, discounting its 1998-99 earnings by 78 times.

GRASIM INDUSTRIES

New Business Strategy

Grasim Industries, the Aditya Birla group flagship, saw mixed performance in 1998-99. While net sales were higher by 7.3 per cent over the previous year, the company's operating profit declined by 3.6 per cent and bottom line plunged by 50.5 per cent.

The sorry state of the cement industry has taken its toll on the company's performance. The company is also engaged in sponge iron and viscose staple fibre (VSF). All three divisions of the company showed a decline in sales.

The drop in the company's profit comes even after Indian Rayon's cement business was merged with the company. Indian Rayon's plant which has a capacity to manufacture 3 million tonnes of grey cement and 3.6 lakh tonnes of white cement was merged with Grasim as part of the consolidation of the group's cement business. Following the merger, Grasim's

NA: means not available

cement capacity has touched 10.7 million tonnes, which includes 0.9 million tonnes of Digvijay Cement and 0.9 million tonnes under implementation at Reddypalayam in Tamil Nadu.

In an effort to improve margins of its VSF division in the current fiscal year, the company has decided to place special thrust on export of speciality products like spun-dyed micro and macro denier fibres. It also plans to aim at product development in end-users. The company's VSF business has suffered primarily due to a steep increase in cheaper import of blended textiles from south-east Asia coupled with a stagnant export market.

Meanwhile, for the first three months of 1999-2000, Grasim has notched a 20.4 per cent increase in net sales over the corresponding period last year. While interest and depreciation were higher by 5.2 per cent and 31.8 per cent, respectively, the company's bottom line moved up by 22.3 per cent over the same period. Despite the improved performance of the company, a temporary suspension of work at its VSF plant put a spoke in the wheels. On the brighter side, its cement bulk terminal plant at Dodbalapur in Karnataka which has a capacity of 6,00,000 tonnes per annum was commissioned in May this year.

The company has now chalked out a threefold strategy to take on the growing unorganised sector manufacturers and smaller brands that have made a severe dent in its profitability. In line with this strategy, the company plans to strengthen its distribution network through better management of its existing 185 show-rooms and substantial increase in the number over the next few years. The company is also planning to introduce ready-made garments to efficiently utilise its excellent brand equity and strong distribution network.

The company's stock presently quotes at around Rs 461 on the bourses, discounting its 1998-99 earnings by 29.2 times.

Calcutta Diary

AM

The poll results are a slap in the face of the conspirators who thought they could walk away with the country. A great disorder awaits India. Is that not a lovely prospect?

SHOVE aside the obfuscations, and concentrate on the basic features of the general election results. One outstanding outcome of the poll is the apparent inability of the two principal political parties in the country, the Bharatiya Janata Party and the Indian National Congress, to claim the loyalty of more than 55 per cent of those who voted. That is to say, at least 45 per cent of the electorate have no particular regard for the two major parties. Their loyalty is to other groups and parties, including the Left, the regional formations, and the caste-based parties.

A significant corollary of the poll result is the relative diminution of strength of the BJP in relation to its allies and, similarly, that of the Indian National Congress vis-a-vis its electoral allies. This kind of outcome is a major blow to those who had drawn up fond designs of an increasingly bi-polar India, where only the two principal parties will count and the rest of the lot are dispensable. Such a design of things is very much in consonance with the concept of an emerging political set-up of the country with power and resources getting increasingly centralised. In course of time, so runs the assumption, the oddities of minor groups and parties will disappear from the scene and India will be a perfect illustration of a two-party arrangement where other voices and views are denied any accommodation.

This species of a political model is a great favourite of Confederation of Indian Industry types. They would like nothing better than the hypothesis of an understanding reached between the two main parties in the country on the basis of a consolidated roster of economic programmes and policies. It will be essentially a CII programme. In the idyllic world the local bourgeoisie dream of, the state's economic policies are expected to be fully adjusted to cater to the Confederation's bill of goods. The poll results bring unfortunate tidings though: the ground reality refuses to conform to the mould proffered by the Indian capitalist class.

India, the election outcome suggests, continues to be a chiaroscuro of shifting patterns of minds and attitudes even as we proceed from region to region and state to state. Those segments of the electorate who, consequent to developments over the past decade, have learnt to articulate their views via the ballot box, are indeed experiencing a whale of a time. The two big parties cannot any longer run away with the polity. Coalitions, of this or that texture, are going to be henceforth the order of the day. Even more remarkably, the coalition partners will be more and more assertive with respect to the charter of rights they want the major partner of the coalition to yield to them. Call it blackmail, it does not matter. The retort of those who indulge in such practices with gay abandon will perhaps be that the blackmail is only partial compensation for the exploitation indulged in through the epochs by the social classes constituting the two major parties.

Discussion of the role the Left groups and like-minded formations could fill in this situation can for the present be left aside. What is however of tremendously greater significance is the emergence of regional parties of various descriptions. It is not just parties such as the Dravida Munnetra Kazhagam, the All-India Anna Dravida Munnetra Kazhagam, the Tamil Manila Congress, the Telugu Desam and its tributaries. It is equally necessary to take into account the role likely to be assumed by the Shironami Akali Dal, the Nationalist Congress Party, the Asom Gana Parishad, the Sikkim National Front, the Mizo National Front, the Gurkha National Liberation Front and so on.

The poll outcome, in other words, elineches the point that we are almost on the verge of no return. The concept of a stable administration the Indian citizenry had grown accustomed to in the 50 years since 1947 has all of a sudden lost its relevance. We are fated for confrontation with a succession of unstable regimes. No party will on its own be any longer able

to exercise total political control over the centre, and therefore the country. Coalitions will be the order of the day, and please do not entertain any notion of the coalitions continuing for ever and ever. Such coalitions will come apart at regular, and irregular, intervals, for the sectarian – and secular – interests of the coalition parties will refuse to abide the pretences of a still centre.

This, day you say, will be inimical to economic growth and accordingly the despair of foreign investors? Few tidings deserve to be applauded with greater cheer. Should the point of view be aired that such a state of affairs could affect the country's international political status, it would be quite in order to break out into a cynic's smile. At the rate at which we have proceeded in the recent times, other things remaining the same, our international political stature will be an exclusive gift to be decided upon by the US administration.

Given this context, a great many things can be said in favour of an ambience where neither of the two major political parties in the country is in a position to give vent to its over-centralised, medieval aspirations. Even before the sustenance of parliamentary democracy is ensured, it is after all, necessary to ensure the sustenance of democracy itself.

And for how long more are we to continue to leign innocence of the other reality this year's poll has been compelled to reveal once more? It has been a frighteningly bizarre serenade of so-called democratic elections, the bomb and bullet blast accompanying the gory killings. The Hurriyat Conference the People's War groups and other Maoist formations Bihar's caste armies, the ULFA and Boro insurgents, the rebels swearing allegiance to the Manipur United Liberation Front and the Achik National Volunteers' Council: add them up, it is yet another facet of the nation's awesome political nitty-gritty. What a cheerful thought, the CII types will have sleepless nights for some while, until they come to realise that India is not just New Delhi and Mumbai. The poll results are a slap in the face of the conspirator who thought they could walk away with the country.

The media will continue to endeavour to sustain the illusion of a stable polity. The poll results suggest the contrary: great disorder awaits India. Is that not lovely prospect?

From Sanskritisation to Hindi-isation and Hindu-isation

The 13th Lok Sabha

Ranjit Sau

It is too early to make a detailed analysis of the general election for the 13th Lok Sabha. The proximate cause of Congress downfall are fairly obvious. The Congress vision of the nation is incomplete, underdeterminate and inconsistent in theory, and gravely dubious in practice. The BJP as arm of the Sangh parivar touches all aspects of our life. Its model of nation is at variance with the true principles of Vedas. Yet has potentially tremendous appeal to the caste-conscious, sanskritising Hindu masses. Not too long ago you heard a chorus of lam: Indira is India. Expect soon a kirtan of hanumans: India is ...

THE Gandhi-Nehru project, flawed at the core; it was an oxymoron of excellence. When caught in an inevitable and it was converted into a Nehru-Gandhi script. In the 1999 general election campaign the Congress president proclaimed, should her party return to power in 2004, electric power would be given free to farmers. The audience at Andhra Pradesh hustings, where she spoke, had a racking laugh to the point of tears. The fire of Indira Gandhi with her crude use of 'garibi hatao' flashed in their mind. Here, again, the same dress, the same face, the same glycerin tears, the same dynasty, all dressed up visibly on a podium - the eerie shadow of Indira Gandhi is stalking the land again, they think. This is the signature tune of the 13th Lok Sabha; the next reels will show a suspense-thriller with usual Bollywood style.

It is too early to make a detailed analysis of the general election. However, the immediate causes of Congress downfall are fairly straightforward: the party has no coherent story to tell voters, its words ring hollow, its network of local organisations is worn out. But it does not solve the other side of the coin, namely, the success of the Bharatiya Janata Party (BJP) at the polls. What makes BJP an attractive choice? What does BJP see that Congress doesn't? Why is the Gandhi-Nehru flop? We begin our narration from this end.

GANDHI-NEHRU AND LOOM

We all do two elementary productions, namely, propagation of species and procurement of sustenance, at two sites

respectively: family and firm. Families assemble to build a society, and firms come to make the economy. To co-ordinate it all springs up another sector, the polity. A nation thus has three parts: society, economy and polity; they interact and seek an equilibrium.

India has several religions. Its society is said to be in equilibrium when each religious group ceases to have relative internal adjustment, and there is no further proselytisation, that is, conversion from one faith to another. The equilibrium thus has two facets: intra-religion and inter-religion tranquillity. The economy operates within the infrastructure provided by the society and polity, but it can and does have a bearing upon the latter two as well. The polity is most agile; it responds mostly to the impulses from society and economy. It has some degree of autonomy, of course. The system consisting of these three parts evolves with its own momentum and absorbs external shocks. We shall view India through this lens of general equilibrium.¹

In shaping modern India Mahatma Gandhi and Pandit Nehru had, as it were, a division of labour. Gandhiji mended the society and Panditji looked after the economy, while both of them were steering the polity. The exercise appears, no doubt, a bit hazardous. The scene reminds us of the case of two persons riding on one horse and racing the same three horses at the same time. So it was.

Gandhiji envisaged India as a society of permanently discrete communities, divided along lines of religion and each subdivided by varna, caste, or similar other ascriptive

marks.² The glue that is supposed to hold the disparate elements together is his doctrine of faith in all faiths: *Iskcon Allah tera naam*. But clearly the patchwork may not be sturdy enough. For it perpetuates the sharp edges of demarcation and brings frictions and bruises. At the operational level it is even more volatile. Despite his grand scheme of Hindu-Muslim unity the Mahatma rejected inter-dining and inter-marriage. Once he declined to have dinner in the company of his Muslim friends Mohammed Ali and his brother on the tenuous argument that eating is a privately performed sanitary routine of life. He condemned Hindu-Muslim inter-marriage as incest [Bose 1998:2094]. Clearly Gandhiji was building his castle on quicksands.³

For harmonious living two communities must not only recognise each other's religion as legitimate; they must also know and respect each other's intra-religion 'caste' structure. Mere 'tolerance' of religions is not enough. For example, a Hindu grocery-store-owner has to be aware of the social prestige of a Muslim scholar-theologian, ulema, in the latter's own community, and pay him equal respect in full, rather than throw him out as 'impure' from the shop's doorstep. The problem would be compounded when the respective caste ranks of two communities do not map one-to-one and monotonously. I have not found any evidence that would indicate that Gandhiji had time even to address the question, let alone answer it. In a word, the societal vision of Gandhiji was incomplete, underdeterminate, and inconsistent, while his own behaviour on related occasions was inscrutable.

Gandhiji said a great deal on simple village life, civilisation, charkha, and all that. However, his utterances on economic matters do not add up to a coherent whole. His insistence on cottage and village industries, spinning wheel, handloom, etc., belonged to a different universe, not known to the contemporary world.⁴ Fortunately, Nehru did not pay much heed to it. What Panditji did, obviously, did not take us very far, either. He set up public sector projects everywhere and anointed them as 'temples' of modern India. The public took him literally. You don't go to temples for hard work, productivity, competition, innovation, investment, and such other earthly stuff, you go there to meditate. And so they did. By the time they woke up, it was too late.

The situation in the field outside those holy places was not much different either.

By some estimates the Indian economy has remained stagnant for as many as 2,280 years; the per capita income is virtually constant over the period between 320 BC and AD 1960 [Lal 1988:34]. Such a case of prolonged economic paralysis is rare in history. The caste system bears part of the responsibility. "The chief features of caste are: (i) Heredity. One cannot change one's caste. (ii) Endogamy. Every member of a caste must marry a member of the same caste and may not marry outside it. (iii) Commensal restriction. Regulations are imposed regarding the acceptance of food and drink from members of other castes" [Radhakrishnan 1940:37]. "Two distinct tendencies are implicit in the caste system. The first is an acceptance of the existence of multiple cultures [one for each caste], including moral and religious norms, in any local society. '...Occasionally, a man is heard making slighting remarks about the hereditary occupations of other castes. The other tendency in the caste system is [Sanskritisation] the imitation of the ways of higher castes" [Srinivas 1966:14; emphasis added]. The first of the two distinct tendencies of the caste system fills the Hindu society with deep ennui and distrust, which partly accounts for the millennia-old economic slumber. The second one, we shall see in a moment, has provided a window of opportunity to the BJP. It transpires thus that both Gandhiji and Panditji had only a myopic grasp of the Indian ethos. The country promptly headed to the edge of precipice.

NEHRU-GANDHI HEIRLOOM

In due course, Nehru's daughter took over the rein, and the new Gandhi began to fill in the blanks. Her calculation was acute. The society, she saw, is split into three segments: lower-caste Hindu, upper-caste Hindu, and the Muslim and other minorities. Incremental return on any political investment will be higher in the first and third segments than in the second. She put on rudraksha mala, visited temples, mosques, churches, sought benediction of every guru who cared to open the door to her. And in the name of dalits, the weaker section of society,⁵ she proclaimed a 20-point programme.⁶ The nation was impressed with her skill in balancing acts. The Nehru-Gandhi era dawned in right earnest.

Her son took the Indira strategy to its logical end with disastrous results. An editorial in *The Times of India* (August 4, 1994) writes that the total electoral rout of the Congress Party in Uttar Pradesh came after 1986, an occurrence that could

be attributed to two major events. In February 1986, the Muslim Women's Bill was introduced in parliament in response to the Supreme Court's judgment in the Shah Bano case.⁷ This alienated the upper caste Hindus. In the same month, the district judge at Faizabad opened the locks of Babri masjid in Ayodhya, apparently at the prodding of Congress leadership. As a result the Muslims started to desert the Congress. As if that was not enough, Rajiv Gandhi started the election campaign in 1989 with a speech in Faizabad, the constituency in which the town of Ayodhya is located, promising Ram Rajya and announcing the 'shilanyas' for Ram temple. The demolition of Babri masjid in December 1992 brought the curtain down on Congress fortunes in Uttar Pradesh.

In a word, the Gandhi-Nehru period saw an ostrich-like passive policy of supporting the social status quo, while the subsequent Nehru-Gandhi dynasty tried to actively exploit religious differences in order to protect itself. A third variety of policy towards religion will be narrated below – that is the BJP's innovation. If Indira Gandhi prostrated before a 'jagatguru' it was to seek her own political salvation; she was at the receiving end of blessing. By contrast, the BJP would operate on the supply side.

As cited above, one of the two distinct features of the caste system is 'the imitation of the ways of higher castes'. Srinivas

(1966) has a name for such climbing of caste ladder – sanskritisation. It has been a powerful force in the diffusion of Hinduism in remote past [Weber 1958: 9-21]. A tribal chief would invite a brahmin priest who will come to baptise the royal-highness-into Hinduism and thus legitimise the kingdom. Maybe, even a kshatriya (gotra) going back to such and such sage (rishi) also can be arranged to further fortify the royal claim.

Such supply of caste recognition and upgradation has been greatly activated lately on demand. The kshatriyas, in particular, are said to be in special need for this commodity. Historians like K M Panikkar maintain that actually there has been no such caste as kshatriya in the last 2,000 years of history. The Nandas were the last 'true' kshatriya, and they disappeared in the fifth century BC. Since then every known royal family has come from a non-kshatriya caste, including the famous Rajput dynasties of medieval India. Panikkar also points out that "the shudras [of all castes] seem to have produced an unusually large number of royal families even in more recent times. The Palas of Bengal originally belonged undoubtedly to that low caste. The great Maratha Royal House, whatever their function today, could hardly sustain their genealogical pretensions connecting them with Rajput descent. One of the most important functions of genealogist and bardic caste

Wanted Asst. Editor

Applications are invited from qualified candidates for the post of Asst. Editor for **SEARCH BULLETIN**. The person would be responsible for 4 issues of the bulletin in a year and would directly report to the Executive Director.

The applicants should be post-graduate in English literature, with an added qualification of degree/diploma in journalism from recognised universities. **Preference will be given to women.** Aptitude for development would be a prerequisite.

The candidates should have a **minimum of 5 years experience** in the field of copy editing.

Selected candidates will be offered a salary in the range of Rs. 10,000/- per month with an addition of provident fund. Interested candidates should apply to the following address:

The Asst. Director (Admn)
SEARCH
219/26, 6th Main, 4th Block,
Jayanagar, Bangalore 560 011.
Fax: 080-6635361

was to legitimise mobility from the ranks of lower castes to the kshatriya, providing suitable genealogical links and myth" [Srinivas 1966: 9-10]. Another calamity has befallen this caste. Islamic conquest and thereafter British occupation of India had rubbed off some of the glaze of the valiant caste (kshatriya). It feels insecure about its identity [Beteille 1996].

Meanwhile, in different parts, there were few castes which, though not regarded as high, became relatively wealthy by reason of their ability to exploit certain special opportunities that came their way during the British rule. Examples of such success are provided by the oilman castes in eastern India, the stillers in Orissa, the noniyas (salt-men) in Uttar Pradesh, the kolis of coastal Gujarat, and the kharwas of Saurashtra. When low caste became wealthy it usually followed this up by Sanskritising its life and ritual, and claiming the status of higher caste. The priests can provide the required service for consummating the finalities of upgradation. A most eloquent example is the case of Amma Coorg. One of the main body of Coorgs, who came under strong brahminical influence in the first half of the 19th century and became vegetarians, teetotalers, and donned the sacred thread. In course of time they became a distinct endogamous group, even though they numbered only 666 (yes, 666) individuals at the 1941 census. A new caste was born. Thus at least one section thereof would Sanskritise its way of life and then claim to be superior to its structural neighbours or to the rest of the section [Srinivas 1966: 30, 9].

Like the interior of a galaxy where new stars are being formed ceaselessly, the womb of Hindu society churns out new constellations through Sanskritisation; and the galaxies in the expanding universe from each other at epic speed. What is static, motionless? Of course, there was no Big bang; it was the creation of the All Mighty! As we move forward in a few moments, it will help make it even more dynamic within the limit of the velocity of light.

Mathematics tell us that between any two numbers there is infinity of numbers. So, between any two castes there is a large number of castes that can be accommodated at ease. And in India there is a huge demand, we have just seen, for caste upgradation at different levels. The Sangh parivar has long been active in this field as supplier of the required facilities. The historical

source of the Sangh parivar is traced to the Arya Samaj, founded in 1875 in Punjab by Dayananda Saraswati, a Sanskrit scholar. Opposed to certain aspects of caste system, idolatry and prevalent rituals, the Arya Samaj was strongly revivalist and proselytising. Dayananda went about reorganising Hinduism around a canonisation of the Vedas. A crucial instrument to this end was the suddhi movement, a movement for purification of the faith. From the 1880s on the Arya Samaj established a system of educational institutions all over north India: the Dayananda Anglo-Vedic (DAV) colleges where English was the medium of instruction. A Sanskritised 'pure' Hindi was promoted in educational work with a view to making it a common national language. At the turn of the century the first regular Hindi magazines appeared, college curricula in Hindi were drafted and Madan Mohan Malaviya provoked by the inauguration of Aligarh Muslim University in 1898, initiated a protracted campaign for a Hindu university with Hindi as the sole medium of instruction. In 1915 Benaras Hindu University came into existence and it became a central point in the movement for making Hindi a national language.

The Arya Samaj promoted eradication of traditional caste identities defined by birth, and suggested a caste system based on virtue and merit, which in principle would be open to all. In spite of such radical postures the project remained largely conservative in its implications. The critique was aimed only at the immobility of the caste system, its brahminical orthodoxy, and its exclusion of lower caste groups. But neither the hierarchical structure of caste nor the essential virtues and character ascribed to each varna and caste was questioned [Hansen 1999: 74].

The Hindu Mahasabha, formed in 1915 with a view to galvanise the Hindu community into a political unit capable of representing 'Hindu interests', initially functioned as one of the interest groups inside the Congress Party. With Savarkar at the helm it became an independent force during the 1920s. There developed a symbiotic relationship between the Mahasabha and the Arya Samaj with double membership and an emerging ideological unity. The Rashtriya Swayamsevak Sangh (RSS) arrived in 1925 to operate on the cultural front. Hedgewar, the founder, envisaged a synthesis of Arya Samaj idealism and organisational strength. Throughout the 1930s the RSS maintained close relations with the Hindu

Mahasabha for ideology and inspiration. Then, under the leadership of Golwalkar, the RSS moved away from politics to concentrate on a radical strategy of creating a brahminical RSS culture, a Bharat Mata in miniature, which by its example and high moral stature would gradually transform norms and habits of the larger society. During the 1940s the RSS became the most powerful Hindu nationalist organisation in the country. One of the most important branches of the Sangh parivar, the Vishwa Hindu Parishad (VHP), was established in 1964 to provide a bridge between the religious organisations and the RSS. Its objective was to consolidate Hindu society. It represented a continuation of the efforts of the 1920s to produce a Hindu nation through construction of rashtra mandirs and an all-encompassing catholic national Hinduism overriding divisions of sect and caste. Several of the leading gurus of VHP have a background in the Arya Samaj, Hindu Mahasabha, Ramakrishna Mission, and other organisations that sponsor a 'nationalised' modern Hinduism. The development of a national Hinduism - 'adapted to the modern age' - remains one of the very significant activities of VHP, it started as early as 1966 with the First International Hindu Conference in Allahabad. A broader activist line was adopted in the early 1970s when the VHP more systematically entered the field of social welfare with schools, medical centres, and hostels all over the country. Another important and widespread activity carried out under the auspices of the VHP is the Vanavasi Kalyan Ashram set up in 1966 as a combined centre of social work and (re-)conversion. It runs a large number of ashrams, schools, colleges, medical facilities, as well as hostels and scholarship programmes for tribals. The Sangh parivar has several other members in its family such as the Sevika Samiti, the Durga Bahini, and the Patit Pawan.

The ancestry of BJP goes back to the Hindu Mahasabha and the RSS. It is the political front of the Sangh parivar, a vast network - a one-stop shopping mall - that can entertain one from cradle to grave in all spheres, social, political, economic. There is nothing like it anywhere else in the world. Clearly, Congress is no match for the BJP in this.

V P Singh once commented in a television interview that the 'mandal' (implementation of Mandal Commission recommendations) would enter the 'kamandal' (a small sacred pot of holy water used in rituals by holy men, a symbolic reference to the BJP) and break

it. But he was wrong. A cushy job, a little bundle of money from the land, or a few extra rupees from some trade, does not meet one's appetite, rather it whips it up. Some lucky people, no doubt, have seen the faces of affluence; now they want higher social status, caste promotion, culture, in a word, sanskritisation. They will flock to the BJP. Congress has nothing to offer them; it never had.

Epilogue

The Mahatma, all due respect to him, was perhaps too god-like to the point of naivety. He was not simply aware of the failings of the ordinary people like us; he did not realise that it is not enough just to accept as legitimate and tolerate all religions. There is a set of annoying details for our daily existence in society. Where would, say, a Hindu weaver place a Muslim fruit-seller in the social matrix for measuring the corresponding respect due him? There is no answer to such a day-to-day question which is, to be sure, of vital importance for living in a village. So long as the society remains a collection of disparate communities with hard boundary-lines and varying internal hierarchies this problem of translation and evaluation would haunt a common man. It follows that the society of Gandhiji's dream was just that, a dream, not viable in theory or practice. On the other hand, for the Nehru-Gandhi Congress of today such questions are too theoretical, too abstract and philosophical; it has no time or inclination for such things. For it, efforts are more profitably spent in playing games with social divisions.

The basic model of BJP seems to have the virtue of logical consistency, but its premises are open to serious doubt. To take one example, Savarkar evidently believes in the Darwinian concept of natural selection: struggle for existence and survival of the fittest. He says: "men, groups and races [are] in the process of consolidation under the stern law of nature, to get forged into that larger existence on the anvil of war through struggle and sacrifice. Those alone who can stand this fierce ordeal will prove their fitness, not only the moral but even the physical fitness that entitles races and types to survive in this world" [Savarkar 1925:xii, cited in Hansen 1999:79]. Now, caste is based on endogamy, and we have seen above that new castes are being born with even as few as 666 members. Endogamy within such tiny groups will be biologically injurious to the groups themselves and to the species as a whole. For Darwin (1859:95) writes: "I have collected so large

a body of facts, and made so many experiments, showing, in accordance with almost universal belief of breeders, that with animals and plants a cross between different varieties, or between individuals of the same variety but of another strain, gives vigour and fertility to the offspring; and on the other hand, that *close* interbreeding diminishes vigour and fertility" (emphasis in the original). If this Darwinian 'general law of nature' holds for human beings, then endogamy by caste might have been very harmful to the vigour and fertility of the Hindus, which might be hard to recover by physical exercise and drill in khaki shorts.

No matter what happens to the economy at large, there are always some people who will somehow get a lot of money. Almost all of them will seek caste promotion, and mathematically there is no problem in accommodating their demand, even if it is almost infinite. Between any two points on a line there is an infinity of points; in a multi-dimensional sphere the scope is even wider. The Sangh parivar will continue to have a busy schedule of performing sanskritisation. The BJP is here to stay for a while, at least.

The preamble to the Hindu Declaration of Human Rights (drafted in Sanskrit and not yet available in its official English version) goes as follows: "A Hindu is like any other human being, only more so, wherefore all human beings possess the following rights as they are all the children of the Earth and descended from Manu and possess rationality and morality in common" (*Pioneer*, June 17, 1995, cited in Hansen 1999). But, as far as we know, in a democracy no one is allowed to be 'only more so', it violates the Universal Declaration of Human Rights, adopted and proclaimed by the United Nations, December 10, 1948. Such a discrimination is not grounded in the Hindu ethos of the Vedic era, either.

Yet the BJP is likely to have a tremendous appeal to the Hindu masses, all eager for sanskritisation. Not too long ago you heard a chorus of lambs: Indira is India. Expect soon a kirtan of hanumans: India is Hindia.

Notes

1 By contrast, there are models of partial equilibrium. Among several brands of this category that are making rounds in India nowadays let us briefly mention three for clarity. One may be called the 'imagining' school, in which the starting point is 'imagination' of a novelist, poet, or bard. A community's identity, aspirations and evolution are all in someone's imagination, and they unfold through diffusion via communication media such as folklore, books, or stage performance. A second one may be called the 'dalit' school which puts the

political action of traditionally oppressed groups such as the scheduled castes (14.6 per cent of total population) at the heart of the current dynamics of India. Third, there is the 'middle' school where it is the middle class of India that holds the key to almost everything.

It is our cardinal axiom that the mode of production by and large shapes the consciousness, rather than the other way around.

- 2 Almost all religious communities have 'castes' in one form or another [Dumont 1966:201-12]. The Hindu caste system is most rigid in that it is anchored on the doctrines of 'karma' and rebirth. Caste systems in other communities are mostly non-hereditary, and fairly permissive. Let us emphasise here that the Hindu caste system does not have the approval of the Vedas; it originated in the later-day Upanishads, coinciding with the rise of private property.
- 3 In ancient times foreign tribes had been absorbed into the Hindu society. "Hindu leaders accepted primitive societies and foreign settlers such as the Greeks and the Scythians into the Hindu fold and recognised their priestly families as brahmins and their fighting men as kshatriyas" [Radhakrishnan 1940:357]. Great invaders such as the Saks (Scythians) the Yavanas (Greeks), the Pahalavas (Parthians), and the Kushans, were accepted as Hindus without hesitation. Much later a reaction against the 'savages from the central Asian steppes' set in, especially after the tribes of Huns were taken over into Hinduism, and an unusually strong disinclination to intermarriage grew. At the moment, however, we are not talking about something like an invasion by the Huns.
- 4 Sen (1968:110) has concluded: "The Ambar Charkha programme is inflationary and is also likely to affect capital accumulation adversely. Far from creating any flow of surplus, it produces a flow of output value less than even its recurring costs. For the Ambar Charkha to have no inflationary results and no recurring adverse effect on the national capital stock, the workers would have to be paid Re 0-1-8 (less than two pence) per 8-hour day, which is quite absurd. As a technological possibility, the Ambar Charkha seems to offer very little." These results were initially published in a note in the *Economic Weekly*, October 19, 1957.
- 5 Sen (1980:447) is amused at the ambiguity of language: The phrase 'weaker section of the Indian population' "has not been descriptively very illuminating. As it happens, people drawn from this 'weaker section of the Indian population' do the heavy work in India, varying from breaking stones and bending iron to carrying heavy loads on their heads."
- 6 For a few months there was confusion about the exact number of points in the prime minister's programme. Initially it was declared to be a 21-point programme. Then the bureaucracy in the prime minister's office discovered to their horror that the last paragraph in the script of her radio address to the nation proclaiming the momentous programme consisted of only 'Jai Hind', which is not really a plan or a development project for the uplift of the weaker section. So the number was duly revised down to a round number 20.
- 7 In April 1985, the Supreme Court of India in a judgment had allowed a Muslim divorcee, Shah Bano, maintenance for life from the former husband. The Rajiv Gandhi government enacted a law in May 1986 that, in effect, overturned

that judgment; the law was drafted with the help of Muslim clergy. Interestingly, a similar case a court in Bangladesh allowed maintenance for life to a Muslim divorcee was just as the Supreme Court of India had done (Enginger 1997, 1999).

A crowning case of sanskritisation may be found here. According to a new report published in *The Times of India* (late September 1999; internet edition) a descendent of Mahatma Gandhi had stated that the ancestral spelling of the surname of Feroze Gandhi (Feroze's husband) was actually Ghandy, formed into the illustrious Hindu, in Feroze's time. If the report is true, scientists may find it interesting. At any rate, the royal lineage of Nehru may be more appropriately expressed in its classical form, the Nehru-Gandhi dynasty.

GOA

Congress Rot: No Cat to Bell

M A Sundaram

The Congress debacle is more to the disarray of the party and its unrealistic assessment of ground situations than to the status of other political forces.

THREE months after the assembly elections in Goa, where Congress secured an absolute majority after 14 years, in the parliamentary elections held on September 5, the party suffered a humiliating defeat, losing both seats it held after the 1998 election. In the Panaji constituency (North Goa) Sripad Naik (BJP), defeated Ramakant Khalap, a veteran Maharashtra Mahantak Party (MGP) leader and former union law minister in the UGDP government, by a margin of 36,721 votes. Sripad Naik had lost in the assembly election in 1994 by 451 votes. In the Mormugao parliamentary constituency (South Goa), Ramakant Angle (BJP) defeated his nearest rival, Joaquim Alemao by a margin of 4,419 votes. Angle had entered the assembly only in 1998, after short spells in the UGDP and MGP.

In the same constituency, Angle had in the 1998 elections lost to the Congress candidate Francisco Sardinha by 6,800 votes. Traditionally a Catholic has always held the South Goa seat. The last time this

seat was held by a Hindu, Madhu Shinkre of MGP, in 1962. In both these constituencies candidates belonging to parties other than the BJP and the Congress, including Wilfred de Souza, who was contesting on a National Congress Party (NCP) ticket forfeited their deposits. The decline in the clout of regional parties, MGP and UGDP had begun even before the assembly elections in June. In the assembly elections MGP was practically wiped out, winning only four seats. BJP won 10 seats, the gains mostly coming from MGP-held constituencies. Talks between BJP and MGP for an alliance before the assembly elections, ended in acrimony over seat-sharing and MGP's role was perceived as that of a big brother introducing BJP into Goa. The UGDP came on the scene when Churchill Alemao won the Lok Sabha seat in 1996. The party merged with the Congress in July 1998.

The denouement in the collapse of the Congress began immediately after the assembly elections and the formation of

the Congress government in Goa led by Luizinho Faleiro as chief minister. The party had a majority of a single seat in the assembly. Soon after he formed his government with a small cabinet of five ministers, dissidence in his party grew and he had had to shore up his strength in the assembly. Faleiro engineered the split in the four member-MGP and Ramakant Khalap with another member joined the Congress. Khalap's entry was resented by senior leaders in the state Congress. The MGP cadre, which has a wide base in North Goa also felt betrayed. In South Goa Churchill Alemao was already staking the claim for his brother Joaquim Alemao. Most Congress leaders including the chief minister are reported to have preferred Uday Bhembre, a respected non-controversial lawyer in South Goa for this seat. The decision of Wilfred de Souza's NCP, to contest from South Goa perhaps finally influenced the Congress Party to field Joaquim Alemao, the rationale being, only a Catholic can reduce the margin of votes Wilfred de Souza may run away with. The good doctor backed by Sharad Pawar had only one objective, defeat the Congress. While the Congress leaders in Goa, the high command, Sonia Gandhi and observers for Goa were assessing the winnability of their candidates, the BJP had chosen their candidates and started electioneering. Chief minister Luizinho Faleiro, who, for the first time in the history of the Congress in Goa, is also the president of the Goa Pradesh Congress Committee, has now admitted that the BJP had a lead of two months in campaigning. In an interview given to *Navhind Times* (October 7), he says, he had predicted on the polling day that the Congress would lose both the seats adding "How can candidates campaign successfully in just 14 days." Such *deja vu* was experienced by everyone in Goa; senior Congress leaders were lackadaisical whilst campaigning in their own assembly constituencies and on the day of counting were hardly seen at the counting centres.

It is no surprise that in many of their constituencies the BJP made substantial gains. The CM expanded his cabinet to 11 and gave three MLAs in charge of various corporations cabinet status, a breach of faith of the election promise made by him and Sonia Gandhi during their assembly election campaign in Goa. He also constituted an election campaign committee, with Pratapsing Rane, former CM and present speaker of the assembly as chairman, Ravi Naik, PWD minister and a former CM as committee chief for North Goa, and Francisco Sardinha, health

minister and former MP (1998), from South Goa as chief of the committee for South Goa. All these three gentlemen have a common *bete noire* – Luizinho Faleiro. As president of GPCC he had made sure accountability was diluted and when the axe falls, whose heads would be in the block.

Both the Congress candidates were new entrants into the party, after either deserting their parent unit or winding it up. Whilst Khalap is a well known leader, Joaquim was a Johnny-come lately. In North Goa, the decision of senior MGP leader Khasinath Jhalmi, to withdraw from the contest at the last minute also helped the BJP. In North Goa, the ruling Congress failed to gain support from the MGP, as their base clearly swung in favour of the BJP. In South Goa, the UGDP links and the faith in the Catholic vote bank did not pay. Wilfred de Souza who polled 10,528 votes also split the Congress supporters. It is also believed that Churchill Alemao's (minister of tourism) angry outbursts against a priest at the Navelim Church and a mass movement by people from predominantly Catholic assembly constituencies in South Goa against the setting up of an allegedly polluting unit-Meta Strips swung some Catholic votes against the Congress. The party has suffered losses in some predominantly Catholic consti-

tuencies and their communal calculation have failed.

In the euphoria following their victory in the assembly elections in June, the Congress in Goa did not assess realistically the inroads the BJP had already made into their own and the MGP's bases. The BJP won 10 seats, but in five other assembly constituencies, they lost marginally. Their percentage of votes had risen from 9 per cent to 26 per cent; the Congress gained only by 2 per cent. In the present Lok Sabha poll, constituencywise analysis shows BJP's lead in 32 of the 40 assembly constituencies: 17 out of 19 in North Goa and 15 out of 21 in South Goa. Poor judgment in the selection of candidates, infighting albeit covert among the local Congress leaders and the CM's own style of functioning helped BJP to make a clean sweep. Kargil, the Vajpayee wave, or Sonia's origins had little impact here, though the losers are attributing these as the reasons for their dismal showing. No one in the Congress has owned moral responsibility for the party's debacle; everyone is quick to talk about collective responsibility. Perhaps Sonia's *mea culpa* absolves them all. Though knives have been drawn against one another, no bloodletting is expected considering the fragile nature of unity amongst Congressmen here. The Congress in Goa does not need enemies.

Local Self-Government and Citizens

J B D'Souza

The growing distance between citizens and the representatives they elect and the disenchantment of people with local government is of serious concern. The many pressure groups which have arisen as a response to this situation can fill the gap only in a limited way.

IN India today there is an acute sense of disappointment, with both the performance and the conduct of our various governments, and specially with governments at the local level. Edward Craven of the British Civil Service College reported in the seventies on public attitudes to elected bodies in Great Britain. "People seem to be less and less prepared to leave decisions to elected representatives who have been chosen largely by a party caucus, who are unknown to the electorate, and whose ability to control the growing apparatus of government seems to be diminishing." What he said about Britain could be repeated concerning people's impressions about our own organs of local government today. Those impressions verge on contempt, contempt both of performance

and of the processes of governance in our cities, towns and villages. Do our municipalities, panchayats and zilla parishads truly give us an opportunity to govern ourselves? Are they really instruments of local self-government? I attempt an answer to those questions chiefly in relation to local government in Mumbai.

The complexities of today's governance have made the ancient Athenian model of democratic practice – the assembly of all citizens – or even the New England town meeting, as obsolete as the myth of the honest Indian politician. It is quite impossible today for an assembly of a whole town to run even a small community with any degree of efficiency. So we choose a set of representatives to do it for us, and we have a chance every five years or so

to change that set. That five-yearly vote should give us a semblance – which has turned out to be less substance than shadow – of ownership, of power. But consider this first. How many of us actually vote in municipal elections, or for that matter even in elections to higher level bodies? Generally, every other person enrolled as a voter is too lazy to go to the polling booth. Even in Britain, that home of democracy, the turnout at local body elections fell from about 49 per cent in the early fifties, to some 30 per cent in the late seventies, and has probably not picked up since then. Voters' apathy in our country may have many causes, but one of them is undoubtedly the fact that when you go to vote the choice you have may be wide because of the proliferation of political parties, but nevertheless is dismal. At the 1992 municipal elections in Mumbai *The Times of India* identified no less than 35 candidates with criminal records, some of them credited with murder, extortion, cheating or forgery. And these were only the ones the *Times* reporter could trace. There must have been many more who had covered their tracks more skillfully. What kind of informed choice can you make out of a ballot paper full of such offerings? Won't you be simply helping to swap today's set of thieves and rascals for a new set, equally addicted to crime? Another problem that prevents adequate representation is the very system of representation, where the candidate who gets the largest number of votes in a constituency, however few they are, emerges as the winner, even if the vast majority of voters have rejected, may even despise, him. In a certain constituency at a recent election, all the candidates lost their deposits, but one of them, the one who got the most votes, had to be declared the winner – who did he represent? At Mumbai's last civic elections, out of 103 successful Shiv Sena candidates, only 20 won more than half the number of votes polled in their respective constituencies. Around the SS heartland of Shivaji Park, the party's triumph hovered around 38 per cent of the votes recorded. Clearly, 83 out of the 103 SS winners had more voters against them than for them. The SS-BJP alliance's new city fathers and mothers strutted about as though the city belonged to them, although two-thirds of the electorate would have preferred a more respectable parentage. Nor was the picture in the other parties' successes much rosier.

Let's move on to the years after the polls. Are Mumbai's citizens left with even a semblance of adequate represent-

ation? How few of us know to our councillor is. Is it only our apathy that produces this ignorance, or are elected representatives too unobtrusive in their activities, too secretive if you like, for us to regard them as valuable assets in our civic life? Soon after the 1992 municipal elections in Mumbai, the Bony Civic Trust, of which I was then the president, naively submitted to each of the city fathers and mothers a set of suggestions for effectiveness in their neighbourhood role. Taking regular, well-timed rounds of their wards, meeting citizens at fixed times weekly, discouraging illicit building – these were some of our suggestions. We could have spared ourselves the effort: there was no effect whatever. In India we favour large elected bodies. Mumbai picks 220-odd councillors to direct and manage, or mismanage, its affairs. No commercial enterprise could survive if it were blessed with a board of directors of that size. Size makes for indecision and misdirection, and this is one reason why our cities and towns are in a disgraceful condition. In a ranking of Asian cities on the basis of the quality of citizens' life, Mumbai ranked 40th – out of 40! (Other Indian cities were near enough to vie with Mumbai that last rank.) Now, whatever the drawbacks of elevating so many of our politicians to be city fathers and mothers, you might expect that it would at least bring citizens closer to their representatives, who would get a chance to serve their constituents better. If that was what you expected, you would be wrong. Wrong because enlarging the size of a council you have smaller men (and women) – persons of stature – into councillor positions. Councillors keep themselves too busy for mundane pursuits like service. They are weightier, and more lucrative calls on their time.

When they are not riding roads – Mumbai's telephone directory has 17 small-print pages devoted to a list of new street names – there are the regular activities of extortion, blackmail, worse to keep them busy. A 1994 *Times of India* report listed 13 Mumbai corporators involved in various crimes, including robbery, dacoity, kidnapping, and even murder. Their numbers quickly grew, despite a dilution of their preponderance in the council; under the new law women now numbered about a third of our representatives in the BMC. Arrests of Mumbai's corporators on criminal charges took place at the rate of one a week, until nearly 10 per cent of city government had a criminal record. Women made sure they were properly represented in this

race to jail. This arrest routine halted only when the city's police commissioner was transferred and replaced by an officer more sympathetic to corporators' taking ways. Who knows how many more of our respected city fathers and mothers should properly take their place in the queue for trial and imprisonment? Meanwhile, about a million Mumbaiers – 10 lakhs – were represented by criminals, or at least by people whom even a tolerant police force has accused of crime. I suspect those 10 lakhs are still so represented; police cases against politicians have a tendency to lose their way. Citizens of other towns in the country are similarly served, I believe, by the representatives they elect. In Pune and Thane, Arun Bhatia and T Chandrashekhar got into difficulties when they tried to make their cities better places to live in. Even relatively upright councillors regard their role as an opportunity to serve themselves or their families. There was a chairman of BEST (a municipal undertaking), who introduced a new bus route to take his daughter to school. He was known as an otherwise honest man. As a perceptive observer of local government in the UK, Francis Stern, observed, not more than 10 or 15 per cent of the members in any local authority really comprehend what is going on, so far as their city is concerned. You have only to watch the proceedings in our town councils to realise that those percentages must be even lower in India. In each year's most important discussion in the BMC, the budget debate, each corporator is by convention allotted a fixed time to air his views. In the year when I was Mumbai's commissioner, I was struck by the generosity of a number of councillors when they cheerfully gave up their time to one of their colleagues; they regarded him as an administrative expert because he had been a clerk in the BMC office before he got elected. He duly spoke at length, with plenty of sound and fury but little sense. At all times, corporators displayed an allergy to study and discussion of the city's major problems – water, drainage, health or housing – but a deep interest in large contracts and a readiness to indulge in orations about Pakistan, China, the US or even Cuba. I once heard S K Paul describe the corporation as a branch of the UN.

ARE PRESSURE GROUPS THE ANSWER?

Along with the average councillor's obsession with opportunities for personal gain, he somehow develops a remoteness from the ordinary citizen. Which is, of course, a sad perversion of one of the major objectives of local self-government,

namely, a shrinkage of the distance between the people and their local government. An enlightened citizenry, ready and capable of participating in political action and community decision-making, is the foundation of democratic self-government, as Donald Stone observes, in *The Future of Cities*. Recent years have seen the emergence of more citizen groups, at least in our large cities. We have the Bombay Environmental Action Group, the Save Bombay Committee, the Bombay Civic Trust in Mumbai, the Public Affairs Centre in Bangalore, Common Cause in Delhi and many others. Recently a new group came together in Mumbai to contest a mindless proposal to raise FSI across the board. Committees have been formed in haste to resist the transfer of municipal commissioners Arun Bhatia and T Chandrashekhar. There are even a few groups active in the rural areas in exposing the misdeeds of zilla parishads and gram panchayats. In Rajasthan the MKSS convened meetings in many villages to combat corruption, with great success. At one place they asked the panchayat about a sizeable expenditure on fitting doors to public latrines. No doors had been fitted; there were, in fact, no latrines at all. The protest succeeded. The money spent was refunded to the public exchequer. Before we comfort ourselves with this growing trend, we should remember – first, that these efforts generally work to prevent specific misfeasance, not to promote good governance. To take a simple example, you may find a vocal and powerful protest against the introduction of a one-way rule on a road. You will hardly ever get a group to insist on police officers regularly registering complaints brought to police stations. Second, these efforts mostly try to resist changes in the status quo; 'they seldom ask for changes in the status quo'. Those who might benefit from a change practically never organise to secure the change. Third, most pressure groups concern themselves with changes in the physical environment, not with other elements of local government, e.g. finance, tax collection, health. Fourth, they are generally middle-class efforts, in the pursuit of middle-class goals, hostile at times, at other times indifferent, to the miseries of poorer people.

We have looked at some of our local authorities, notably Mumbai, to find out what they offer residents of these localities in the way of exercising their citizenship roles. I have tried to show how inadequate these offerings are. I turn now, and finally, to a still less attractive feature of our city and district governments. That feature

arises out of the attitudes of state governments to the local authorities they have themselves created. In both rural and urban areas local authorities are regularly starved of revenue resources, and made heavily dependent on subventions from the state. Neither municipalities nor zilla parishads can introduce new taxes without state governments' blessings, and state governments are always far too protective of their own revenues to encourage any encroachment on their domain. Maharashtra has steadily refused to countenance a municipal surcharge on the sales tax it gets from the city of Mumbai, although that would help the BMC remove octroi, which everyone agrees is a disaster. Entertainment tax, a levy generally available to local authorities, is regularly usurped by the state. Mumbai has a tiny municipal vehicle tax for maintenance of its roads; it is a negligible fraction of the motor vehicle tax the state collects from the city, and itself retains. Ironically, by forcing local bodies to rely on state grants, the states have bred in the former a trend toward financial irresponsibility. Sharad Pawar once told me that the Akola municipality was paying out to its staff 103 per cent of the revenue it collected, requiring a last minute state rescue operation. Another disturbing trend in recent decades has been the creation of special purpose 'development authorities' within and beyond municipal limits. These authorities take over the water and sanitation systems, other public works like flyovers in Mumbai, or real estate development. They are entirely bureaucratic and unaccountable to the local people. They lessen even the small participatory role that citizens have in relation to elected municipal councils and zilla parishads. In extreme cases, lamentably quite frequent until the 73rd and 74th amendments to the Constitution, state governments have been much too ready to supersede local bodies and to keep them in suspended animation for years together. The Madras Municipal Corporation was so kept in suspension for some 20 years. Numberless local bodies in UP suffered similar disabilities for long periods, under bureaucratic control. For the citizen all such administrative intrusions increase his remoteness from the centres of decision-making concerning his well-being.

We have here taken note of the dwindling interest in local elections, as measured by the dwindling turnout of voters. We have noted the paradox that as a fairly general rule the persons we vote into office are really rejected by the majority of voters;

many of these poll-winners have track records of which you and I would be ashamed—records that they continued during their tenure to embellish with further delinquency. Still worse in this litany we have had to observe the growing distance between citizens and the representatives they elect, and the consequent emergence of pressure groups, which in some fashion

fill some that distance; we have noted limitations in their activities. Worst of all is the citizens' growing disenchantment with their representatives' performance of local governments, and a resultant waning of vigilance over their operations. Disenchantment tends to be self-filling; it feeds on itself, and leads to still less satisfactory performance.

Doctoral Work in Social Sciences Some Reflections

V Subramaniam

If doctoral theses in the social sciences are an indication of the status of research in these disciplines in India, it is in poor shape.

EVER since a PhD degree became a necessary passport to a university career in India, there has been an increasing output of PhD theses in the social sciences and a search for examiners. Indian universities have started making use of Indian academics abroad as external examiners and for some reason or other, I seem to have been targeted most often over the last 15 years. It has fallen to my lot to examine over 40 theses in the social sciences from seven universities in India. This entitles me to indulge in some reflections and share some observations about some aspects of doctoral work in India—in the hope that it may be of some benefit to others.

First, about the origins of the doctoral degree itself. The term doctor was used from the medieval period onwards to mean a learned man. It was applied on the basis of one's established scholarly reputation based on evaluation by peers. But there was no formal process by which it was done, for several centuries. It took shape mainly in German universities in the 19th century in the physical and natural sciences first. The idea of formal laboratory research on specific problems was born out of the new German empire's commitment to catch up with the Industrial Revolution in Britain and do better. The earlier British achievement was largely based on amateur inventions and serendipity without a foundation in scientific experiment. Germany's plan was to promote and use academic science methodically to achieve industrial development faster and practically. The institution of a PhD in the sciences was a product of this commitment. It was followed naturally by the enlargement and encouragement of formal doctoral research in the social sciences. There was no competition from France as French university education was going

through a batch. Napoleon had reorganised education on a professional Ecole system, which strengthened the army and the civil services but bypassed the universities. In short Germany set the model in planned research and its formal recognition through a doctoral degree during the decades before the first world war.

It was natural for British graduates in the sciences to go to German universities for further research and a doctoral degree till the 1920s. Thus Lord Haldane (later minister for war), Lindemann and Sir Henry Tizard (both in the Churchill war cabinet) all took their doctorates in Germany. It took considerable persuasion, particularly by Sir William Ramsay, for British universities to institute regular university research programmes for doctoral work. The establishment of the Cavendish Laboratory at Cambridge was the signal of acceptance of the German concept—and very soon it produced a crop of Nobel laureates in science. In the social sciences, however, it took much longer for doctoral research to be instituted as a regular feature of universities. American universities on the other hand were inspired quite early by the German example.

Indian universities did not encourage much doctoral work in the social sciences, during the British period, partly because it was not that highly developed in Britain itself, though research in the physical and natural sciences was being promoted. Indian scholars who did their doctoral work in Britain were attracted very much by the London School of Economics and Political Science but after India's independence, there was very little academic research on India by the British for nearly two decades. Instead there was a regular invasion of American academics and graduate students—doing doctoral work

on Indian politics and society. As a result, it is the American approach, format and values that seem to have influenced the nature and format of doctoral research and supervision in Indian universities.

This is evident in the choice of topic and in circumscribing it. The American pattern of choosing a comparatively specific limited topic or institution for a specific short period has become the norm. The idea of relating it to wider social, political and economic context is not considered seriously. In regard to sources also, an effort is made to collect all the evidence from printed sources and documents giving them equal weight without much discrimination about the nature of the source. Thus an annual report 'advertising' an institution's 'achievements' gets the same attention as a critical objective article.

This overall approach is fully prevalent in America. The common doctoral thesis in the social sciences is full of references and cross-references – and some theses, the references and notes could occupy space equal to the text. The American researchers take the same approach to their work in India too. All this does not do too much harm in American academe where they regard doctoral researches as bricks for an edifice as part of a cumulative whole for a professor-supervisor to collate and build on. Doctoral scholars themselves go on to do further work on the same or similar topic or start a new thing.

The specific limited topic, the laborious collection of source material and the descriptive approach writing it all out without evaluating the use of the sources and with little concern to relate to wider issues, this American approach, needs to be consciously corrected as it does more harm than good in the case of India. It is not enough to choose broader topics. It is far more important to relate the topic and the conclusion of one's research to the wider area of society, policy and economy.

For example, there are some theses on an administrative institution say in one state of India – which take little note of its actual and potential relations with the union government. In the field of history, a good thesis on elites say in the Hoysala empire, in relation to the monarchy hesitates to make the obvious comparison with the similar problem of state elites and monarchy in the earlier Chola empire. Another is on the administration of a 'Rajya' in the early Vijayanagar empire, gives a lot of detail about large agricultural lands owned by temples – but does not say anything significant

on its consequences in entrenching state control of society and cultural reproduction.

This is not to downgrade Indian doctoral work in the social sciences, but a plea for reorientation particularly to thesis supervisors, not to encourage choice of convenient limited topics and to insist on relating the research to the broader society and economy – and make some comparisons. This is going to be particularly difficult with the increasing demands made by many young lecturers, to get their doctorates in a hurry. But the results would be cumulatively beneficial. Instead of waiting for a foreign scholar or a local senior professor to use all the descriptive narrative to propound a more general thesis, Indian scholars and their supervisors can do it themselves and thereby set a higher standard for doctoral work. This is necessary not only to match international standards but also to catch up with standards in the physical sciences and economics in India itself. Research in these areas is more exposed to international comparisons and knowledge of this has helped to set and maintain consistently high standards.

I must recognise the good quality of doctoral research in some cases, partly

occasioned by the topic itself and in part by the commitment of the student and supervisor. Offhand, I can think of a thesis on concepts of the state in recent Indian political discourse – and another on Vivekananda's nationalism and a third on early Chola temple architecture. In cases, where the basic task of fact collecting was well done with a hesitant attempt at conclusion, I have asked for a rewriting of the final chapter. In just a few cases where the facts were just catalogued from obvious sources, I had to turn it down altogether. On the whole the experience was worthwhile as it kept me in touch with the efforts of a young generation of graduate students.

In addition to academic development, improvement in doctoral researches would also serve an important socio-political goal. Foreign dominance produces long-lasting effects on the mind in regard to self-definition of one's group, carrying it to the extremes of denigration or boastfulness. These effects wear out early in the more objective areas of the physical sciences and even economics – but tend to stick around longer in the other social sciences. Purposely directed improvement will help to clean up lingering traces of such moulds in India's research arena.

The University of California, Berkeley invites applications for a tenured position in South Asian Studies beginning in the 2000-2001 academic year. Candidates in any social science discipline whose work is committed to the study of contemporary India will be considered. The appointment will be made to the department of the successful applicant's expertise. Capacity and willingness to serve a term at some point in the future as the chair of Berkeley's Center for South Asian Studies also will receive positive consideration. It is expected that an endowed Chair in India Studies will accompany the appointment. Applications with vitae, names of at least three references, and other relevant supporting materials should be sent to **Ms. Gail Stern, South Asia Search Committee, International and Area Studies, 260 Stephens Hall, University of California, Berkeley 94720-2300** by **October 31, 1999**. The University of California is an Affirmative Action, Equal Opportunity Employer.

A Benevolent Dictatorship?

Akbar Zaidi

It may well be that Pakistan was experiencing democracy at its worst under Nawaz Shariff. But democracy is a process that takes time to put down roots and not a mechanism that offers instant good governance. And the unconstitutional dismissal of a democratically elected government by the military is not the solution.

AT the end of July this year, I was engaged in a long conversation with a friend from India who is at the School of Oriental and African Studies (SOAS) in London. The discussion, not surprisingly, was Kargil and the developments that had taken place in our two countries since February. In the period between February and end July, a number of important developments had taken place. The most significant of these were, the Lahore Peace Process and Declaration, the war in Kargil, the end of BJP's second tenure in government and the forthcoming elections in India, and finally, Nawaz Shariff's July 4th dash to Washington to ask for President Clinton's help in coming up with a face-saving solution for Pakistan so that it could withdraw from Kashmir/Kargil somewhat respectfully.

I told my Indian friend that Nawaz Shariff was genuinely interested in peace with India as he was a businessman and he realised that better trade and economic relations would ease some of the pressure on Pakistan's visibly shaken economic condition. Trade and economic relations would benefit Pakistan overall and particularly the Punjab, which had land links with India and would allow cheap and easy access to Indian imports and raw materials. Punjab was Nawaz Shariff's main constituency as much as it is the army's. With Pakistan facing a growing debt burden and with pressure to reduce expenditure, the military was also reluctantly coming round to the need for reduction in its share of the budget, with some belt-tightening leading to a slowing down in military recruitment over the middle to long term. Besides, now that Pakistan had become a nuclear power, there may have been some arguments which suggested the need for a smaller conventional army. I argued that not only was Nawaz Shariff interested in a peace initiative with India, but now probably so was the military, as it had realised that with national economy in a shambles and the debt situation increasingly unsustainable, the only way out to solve Punjab's employment and economic

situation, was to involve the army's Punjabi constituency in trade and economic activity, and better relations with India offered that possibility. However, Kargil intervened.

I have maintained since the Kargil fiasco became public something that I tried to convey to my friend from SOAS, that this intrusion into Indian Kashmir was organised and masterminded by a section of the army or the Inter Services Intelligence (ISI), to undermine the sensible and urgently required peace process initiated by the civilian government of Nawaz Shariff. I also felt that this was not something that Shariff would have initiated as it contradicts his earlier efforts of gaining a larger profit from trade and economic opportunities which would have benefited him, his family, his business interests and his constituency. There was no logic in Shariff's action. I tried to convince my Indian friend, that the military was independent of civilian control and wanted to sabotage the peace initiative, as the military was the most important beneficiary of any war hysteria over Kashmir. My friend from SOAS said in disbelief, that no one in India would understand how a military could be independent of civilian control in a democracy, even one like Pakistan's. In September this year, Niaz Naik, a former federal secretary and emissary of Shariff went public and said exactly the same, that Kargil was instigated by the military and the prime minister knew nothing about it until it was far too late.

The events last week have only confirmed the view that it is the military which still holds supreme power, and rules (and now governs) Pakistan and makes all the important decisions, despite a period of democracy which had lasted almost exactly eleven years. The as yet unformed military government will be the ninth in these eleven years, which includes four elected and four caretaker governments. Such is the state of democracy in Pakistan, that none of the four elected governments – the two of Benazir Bhutto and two of Nawaz Shariff – have completed their

tenure. The first three were dismissed by the president and the last one by the military. The key difference in all these dismissals is that while the earlier three were dismissed by the president, he had the constitutional right and provision to do so under the Eighth Amendment of the Constitution of Pakistan. This time round, the president no longer has the power, and the military has acted unconstitutionally.

Pervez Musharraf in his second address to the nation said that rather than let the entire body (of Pakistan) rot and break away by following the Constitution, he decided to amputate a leg (the Constitution) and save the rest of the body. He has realised that he has acted unconstitutionally and has put the Constitution in abeyance, until that time when he and the military decide that it is time to hold elections again and to resume the process of democracy under far different conditions and rules. (Now where have we heard all this before?) Although martial law has not as yet, been declared, and the so-called chief executive has spoken about basic freedoms, including that of the press, the national and provincial assemblies have been suspended, though not as yet, dismissed.

Numerous elected and appointed government functionaries are being held without any cases against them, while many others, including ambassadors, have been arbitrarily removed from their previous posts and assignments, without any explanation and reason given for this action by the military. So much for this brand of accountability.

Musharraf has announced a system of administration of government which he will head as 'chief executive' and will constitute a National Security Council which will include the naval and air chiefs and four other 'experts' (who need not be civilians), a think-tank to advise the government, and a cabinet of ministers which will work under the guidance of the National Security Council. The chief executive's immediate agenda includes the aim to rebuild national confidence and morale, strengthen the federation, revive the economy, decentralisation and devolution, speedy law and justice, and of course, the accountability of those who have held power in the past. Importantly, none of the orders of the chief executive can be challenged by any court or law in the country.

My friend from SOAS and numerous other Indian friends would probably not understand why the military coup has been so unanimously well received in Pakistan. All political parties, including important members of the dismissed Muslim League, and all the combined opposition, have

welcomed Musharraf's intention. There has been not a whisper of opposition by any quarters in the country. Even those so-called liberals and champions of democracy, who fought against General Zia's military dictatorship, are now writing articles justifying his takeover, arguing that this is the only way to save Pakistan from certain catastrophe. They use arguments saying that authoritarian rule has provided very effective results and cite the example of East Asia. They say that Nawaz Shariff would have led a country to destruction within a matter of a few years; by gambling on the military they are hoping that this will not happen. And if it does, some say, well it was always inevitable. The military is their last hope, they justify.

The liberal intelligentsia which harbours some image of 'democracy', and the elite who want a 'level playing field', have welcomed the military rule under Musharraf as nothing less than a saviour, their messiah on a white horse. They have felt that what we had in Pakistan was not democracy, and have supported the dismissal of each and every one of the five elected governments since 1988. This section of Pakistan's privileged class, more concerned with 'good governance', swift and fair justice, the end of nepotism and corruption, and a revival of the economy.

It matters not how these goals are achieved, as long as someone fulfils them. All these things have been promised by Pakistan's new chief executive, and hence the unflinching support for him. A benevolent dictator, it is said, is far better than a despotic, incompetent and corrupt democratically elected leader. In all this, they forget that 'good governance' requires participation, pluralism, accountability and openness, none of which can form part of undemocratic military rule, no matter how benevolent.

Perhaps the main reason why there has been no protest against the imposition of *de facto* martial law in Pakistan, is that many opinion-makers and elected representatives were fed up and tired of the way the country was being handled over the last decade under democracy. While democracy may have existed in name, this section of the Pakistani people felt that their problems were increasing and there were signs of further decay. For this group, it mattered not who would undertake reform or how that reform was to be undertaken, as long as it was done. Hence, their enthusiastic and wholehearted acceptance of the programme announced by Musharraf, a programme probably no different from that of many a political party in Pakistan. Musharraf is saying exactly what a number of liberal groups

and individuals in Pakistan have been saying for years. What else can they do but support him?

Musharraf has declared that he believes in democracy, and wants to create the conditions which would ensure 'genuine' democracy, after which the army will return to the barracks. This too, pleases the liberal lobby which now so enthusiastically supports the coup. In many ways, this programme seems far more similar to that of the coup of Ayub Khan in 1958 than of General Zia in 1977. Ayub was also a modernist liberal, who wanted to bring about an administrative and managerial solution to Pakistan's problems at that time. General Zia, on the other hand, came on the back of a wave of mass civil unrest, with a far more conservative social and political programme. Musharraf's guarantees to the religious minorities of Pakistan, have gone down particularly well with the liberal groups that constitute the Pakistani public.

The first speeches of almost all of Pakistan's elected, dictatorial or caretaker leaders, have differed little in intent from that of Musharraf's this week. They all talk about critical junctures, accountability of the past, moral authority and direction, and the like. After about a couple of years, the expectations with every new government go sour and the government begins to lose its popularity amongst the public. This happened with Nawaz Shariff's government as well which had a mandate which is never likely to be repeated gain.

What the reaction of the so-called liberal and pro-democracy elements in Pakistan towards Musharraf reveals is that this important section does not consider democracy to be a process which takes time, often generations, but rather, a mechanism which puts in place instant solutions irrespective of how they are to take place. While they talk about 'institutions' and institution building, they are not concerned with how these interventions take place, or who builds institutions in their own preferred manner. Most importantly, the process of building democratic institutions in a country which has had military rule for almost half of its 52 years, is not considered important enough.

Call it opportunism or a lack of hope, or one last bet, but the public in Pakistan has overlooked a number of important facts emerging in recent times. Firstly, all the attacks against Nawaz Shariff since his ouster, have labelled his government a one-man autocratic set-up and this seems to be one of the stronger charges. Yet, while these people welcome Musharraf as their saviour, they conveniently ignore the fact that military rule is always a one-man

rule and potentially far worse than any form of autocratic democracy. Besides, democracy always has the military as a potential watchdog, its checks and balances, if things get out of hand; the question of replacing the military does not arise, and one must await events of extraordinary proportion to do so. The war of independence of East Pakistan with the secession of Bangladesh and an air crash clouded in mysterious circumstances, were the events which culminated in the end of martial rule twice in the past.

Second, our good liberal friends endorse the measures taken by Musharraf to initiate the process of accountability of Nawaz Shariff and his cronies, conveniently overlook the fact that the orders of the chief executive cannot be challenged by any court in Pakistan. Moreover, his dismissal of the government itself and the abeyance of the Constitution are both illegal. Who will hold the army accountable?

Thirdly, all the ground that had been taken by the liberal lobby after the Pakistan army's fiasco in Kargil, in terms of discussing the role of the military in Pakistan's economy, has certainly been lost. After Kargil, many of us questioned the amount budgeted to the military each year, and there was a possibility that the voices of democracy may have put some pressure on the military to reveal its accounts. Clearly, that opportunity has been lost for good. Linked to this, was the possibility of peace in South Asia, with the BJP and Nawaz governments talking peace and moving towards economic and trade relations to start with. This too, has been put aside for the moment.

All the liberals who are banking on the military are the same ones who backed the World Bank's Moeen Quraishi when he was a caretaker prime minister for three months in 1993. This time, they are openly stating that they want the military to stay for some time, two years at least, so that it can cleanse the democratic stables of their undemocratic components. They are relieved that the chief of the army staff does not wear a beard and speak the language of General Zia or the Taliban. But this precisely is the problem. By supporting this intrusion by the military in Pakistan's politics, next time round they may get the worst end of the stick. It is this liberal and supposedly pro-democratic element which has probably done Pakistan its biggest disservice. Had they been an active and effective lobby in the first place, things would not have come to the stage where they have. Pakistan's greatest tragedy is not that the military has taken over, but that we allowed democracy to degenerate to the level it did.

State and Market

Altering the Boundaries and Emerging New Balances

Y V Reddy

The concept of the mixed economy that we adopted was the right one. What is called for is a dynamic and bi-directional movement between the state and the market. The reform process in India has been able to capture the basic elements of this complex reality and there is, at least at the conceptual level, a pragmatic framework. There are emerging new balances and a dynamism has to be located in these new balances. Analysts need to understand these emerging new balances to appreciate the stability and pace of reform.

THE altering of the boundaries between state and market encompasses, what is variously described as realigning government, structural reforms towards liberalisation or deregulation, and changing mix of the mixed economy. To enable an appreciation of this changing mix between state and market in India, a combination of descriptive and analytical approaches is adopted in this essay, with a focus on what may be described as relevant functions, processes and balances. The presentation is arranged in five sections. The first section describes how the mix of the mixed economy was in the process of changing in India from the commencement of planning in the fifties up to the current reform period. The second section describes, by applying a functional approach to the role of the state, how the boundaries between state and market in the mixed economy are currently being altered in the reform period. The third section narrates the process of altering such boundaries, illustratively at the federal (central) government level and at the provincial (state) level. Reforms in the external and financial sectors are not discussed here. The fourth section explores the new balances that are emerging in our country as a result of such altering of boundaries between state and market. Analysts are advised, in the light of these developments, to focus their attention on the emerging new balances in order to appreciate the reform process and its outlook. The final section briefly mentions the response of the Reserve Bank of India (RBI) to some of the emerging new balances. It needs to be clarified at the outset that the word state is used here broadly to reflect the government sector

in totality, i.e., the central, provincial and local governments, encompassing legislative, executive and judicial branches. For convenience, the word central is used for the constitutional expression 'union government' and similarly provincial for 'state government'. Further, the term, public sector is used broadly to signify the aggregate of government and public enterprise sector, and public enterprise signifies non-financial publicly-owned corporate entities – whether under a separate statute or a government company under the Companies Act. Where publicly-owned public enterprises of financial sector are included in the broad public sector, this fact is specially mentioned.

CHANGING MIX OF MIXED ECONOMY

There was a virtual consensus, at the time of independence, on three basic tenets for free India, viz, democracy, federalism and a strong role for government in economic development or what came to evolve into the concept of mixed economy. Mixed economy generally meant active and direct participation of the government in economic life, combined with government's direction of market forces, to subserve the goal of development and social justice. The mixed economy approach held sway over mainstream economic thought and political debate (barring the right-wing Swatantra Party, active for a while under the leadership of Rajaji) for four decades. During this period, the mix between state and market was characterised by two features. First, the role of the state expanded, i.e., the mix was moving unidirectionally, and there was seldom a retreat. Second, the pace of expansion of the state was not uniform and

in fact there were many occasions of uncertainty and doubt on the role of state, but seldom was decisive action taken towards a retreat of the state vis-a-vis the market, till the balance of payments crisis of 1991. These features are best illustrated by some periodisation, though any attempt at periodisation has some subjectivity.

1951-61 represents the ascendancy of state, with an overwhelming consensus in favour of an active role for state, and such a role was sanctified by the Directive Principles of State Policy, and operationalised through a process of planned development. The control apparatus of the government imposed during the second world war provided a readymade framework for legal and institutional instruments for state intervention. The international consensus was broadly supportive of India's approach, to the extent that this approach combined democracy and liberal values. The constitutional provisions, legal framework, and interpretations of the judiciary were supportive of such a domineering role for state, mainly as a result of the Directive Principles of State Policy in the Constitution.

However, in the mid-sixties, following war and droughts combined with industrial recession, a 'plan-holiday' had to be declared. Uncertainties, in particular, political compulsions, led to the nationalisation of major banks, providing the government relatively easy access to household savings in order to finance its activities. Soon the first oil shock affected international sentiment on capital flows to developing countries and some aid-weariness also set in. Overall, therefore, the period 1967 to 1977, could be treated as a period of uncertainty and mixed signals, but expansion of the state did occur in spurts, particularly in a plethora of legislative action.

By 1977 it was clear that the Plan strategies were not paying rich dividends and a period of introspection started in 1977, lasting till 1984. A number of high-level official committees were appointed to examine physical controls, monetary policy, trade policy, public enterprises, etc. Each one of them recognised the need for a review of the mix between the state and market and recommended a definitive tilt towards marketisation of the mix. However, no tangible policy action was forthcoming, perhaps due to inadequate political consensus.

The next phase, from 1984 onwards, came to be described as the New Economic

Policy and was essentially an attempt to break the stalemate in state action and introduce market orientation. The new policy aimed at higher growth but given the unwillingness to impose the necessary fiscal discipline, significant acceleration of growth and growth-led jobs was achieved at considerable cost, namely, relatively unsustainable levels of fiscal deficit, current account deficit and external debt, especially short-term debt. In fact, inadequate productivity from the use of resources, while first and second tranche of Extended Fund Facility from the IMF were drawn, also resulted in strains of repayment to IMF during the late eighties. Since higher growth was attempted without breaking the stalemate in state action, there was ripe ground for a crisis.

In brief, there was a chaotic mix, but it tended to be unidirectional with varying pace but generally in favour of the state, and often in spurts, though during the latter period with serious doubts.

The year 1990-91 saw the Gulf war, which triggered a balance of payments crisis. The seriousness of the crisis, especially the dramatic loss of sale and repurchase of government gold through the state Bank of India and pledge of RBI's gold, did evoke a national consensus on stabilising the economy and undertaking appropriate reform. This provided justification for a serious effort to break the stalemate in state action. In other words, the unidirectional nature of changing mix between state and market since 1950 was, virtually for the first time, reversed in 1990-91. However, it was not merely the crisis, but the prevailing economic scene on the eve of reform which enabled initiation of reform. The features of the scene may be summarised as follows:

First, there was an intellectual recognition of systemic problems, particularly in the areas of fiscal management, public enterprises and over-competitive strength of industry.

Second, while there was respectable, if not impressive, growth over 5 per cent in the eighties, compared to the 'Hindu rate of growth' of 3-3.5 per cent previously, it was clear the policy-makers that such growth was financed by unsustainable fiscal as well as trade deficits, and growth lacked institutional underpinning to take the economy to a higher growth path or ensure social justice.

Third, while the policies were originally aimed at protecting the labour force, incentive mechanisms got distorted and institutional rigidities crept in, leading to the 'tyranny of 10 per cent' – 10 per cent being the

share of organised labour (both in public and private sectors), select industrial houses and a rentier class encouraged by the political system. What was described as a soft state, tended over a period to be so soft to the '10 per cent' that to promote the interests of this 10 per cent, the state ended up being a hard state on 90 per cent of the labour force. This large work force started becoming restive, being tired of promises of elimination of poverty not backed by delivery and therefore, this large segment had to be pacified with what have been described as 'populist schemes'. It was no longer easy for the policy-makers to be both soft on the organised work force and provide succour to the large unorganised sector.

Fourth, the educated constitute the most articulate section in our country, as in many other developing societies. In the fifties and sixties, and to some extent in the seventies, the flow of a significant portion of educated was absorbed through employment in the growing government sector, the public enterprises and, to a very limited extent, the private corporate sector. With a larger output of educated youth and a deceleration in the growth of employment in organised sector, there was a growing pool of educated, self-employed or unemployed, outside the '10 per cent'. Politically, it was possible to counter, however feebly, the aggressive stance of the '10 per cent' since a significantly large part, almost the whole of the educated class coming out of high schools and universities, was left out of employment in the organised sector and were thus outside of the '10 per cent'.

Fifth, it was clear that the delivery of government services had become costly and was generally perceived to be very indifferent and inefficient – be it schools, hospitals, or public utilities like water supply and sanitation. The legal and institutional set-up gave rights to the stakeholders in the public sector even if these rights were to the detriment of the citizen. The stakeholders were not only employees, but also contractors or suppliers, or retail agents, etc. In fact, many felt that these stakeholders pre-empted financial resources sometimes at the cost of the original purpose of employing them. So there were schools with teachers and no buildings or teaching materials and hospitals with no medicines, electricity or water. Incidentally, the salaries of the public sector had assumed implicit productivity increases, viz, annual increments in addition to inflation indexation and any shortfall in assumed productivity increases worsened the situation. The managers in

the public sector, including the financial sector, often complained about the inflexibility introduced through inherited rights and work practices resulting in erosion of scope for productivity increases to match salary increases.

Sixth, there was an emerging parallel economy not only in money, called black money, but in most public services (with private schools, private hospitals and bottled drinking water rather than tap water becoming the preferred options). Further, there was resentment about delivery of services in public systems even among the '10 per cent', when somebody else was supposed to deliver the service.

Seventh, given the fiscal situation, the public enterprises which saw fiscal support drying up started clamouring for market access, autonomy and even some privatisation.

Eighth, the private sector, including the corporate sector, realised that the capacity of government to support them was getting eroded due to fiscal compulsions, while regulatory and other demands from government continued to be perceived as a burden on them. In the absence of fiscal support from government, they found it worthwhile to seek deregulation and liberalisation, arguing against what has been described as over-regulation and under-governance.

Ninth, there was a widespread realisation that the basic assumption of efficiency and effectiveness of state vis-a-vis market appear to be less valid than before, mainly due to technological progress and institutional characteristics of the public sector. The success of alternative models in other countries, in achieving both higher growth and social justice was impressive and sustained, and was too apparent to be ignored by the public opinion in India.

Finally, it was widely believed that reform was on the cards even by the late eighties. However, the Gulf war, which triggered the crisis, enabled projection of external factors as the main cause of the crisis. Thus, economic compulsions for reforms were clear for at least a decade before reforms commenced, but the issue was mobilising political support and evolving a consensus on the details of reforms in a democratic-federal set up – a problem for which a favourable environment emerged with the Gulf crisis.

FUNCTIONAL APPROACH TO ALTERING THE BOUNDARIES

In the functional approach to the role of the state it was argued that altering the boundaries between state and market could be analysed in terms of different roles of state. State's role in economic activity can

be broadly classified into that of producer-state, i.e., producer of commercial goods and services; regulatory-state, involving setting and enforcing of rules that govern, encourage or discourage economic activities of market participants; facilitator-state, involving provision of public goods such as police, judiciary, street-lighting; and welfare state, ensuring provision of a wide variety of merit goods such as education and health. In the functional approach, the process of altering the boundaries between state and market, are tracked with reference to each of the four functions mentioned.

Retreat as Producer State

The process of retreat of state as a producer of goods and services involves exercise of several options in a variety of areas. As a producer of commercial goods and services, the major option exercised by the government was to permit entry of private sector in activities that were reserved for public ownership. This option does not necessarily involve retreat of state in absolute terms though in relative terms it amounts to a retreat. Currently, except for sectors such as defence, entry for private sector is permitted, and in many, in fact, encouraged. These include oil exploration, power production, telecom services, etc. The change was operationalised through a series of statements on Industrial Policy. Second, exit of public enterprises in terms of closure is technically permitted under the aegis of Sick Industrial Companies Act, which was amended to bring public enterprises within its jurisdiction. Third, exit of workers in public enterprises was also enabled and encouraged through adoption of voluntary retirement schemes and creation of National Reconstruction Fund. Fourth, some public enterprises were corporatised (that is converted into companies under the Companies Act) and in many public enterprises, private equity-holders brought in. The public enterprise sector which was invariably 100 percent government-owned earlier, earlier became one in which there were some enterprises with diversified ownership, although in many cases, majority ownership continues with government. Fifth, significant autonomy in functioning of public enterprises has been announced and some attempts have also been made in this direction. Sixth, in a few cases, government took up financial restructuring of enterprises to enable these enterprises to compete with private enterprises and meet the threat of imports under a liberalised trade regime. Seventh, compared to the past, a hard budget

constraint has been imposed on public enterprises. Eighth, preferential treatment to public enterprises through exclusivity or price preference in purchases or sales within the public sector has been formally dispensed with. Ninth, privatisation involving transfer of majority ownership to private sector and change of control has been conspicuous by its absence.

It is possible to argue that the entry of the private sector has been insignificant in some sectors, possibly due to incomplete process of regulatory reform; that, in reality extension of jurisdiction of BIFR to public enterprises has not yet served any purpose; that the impact of VRS or labour-flexibility has been very marginal; that diversified ownership was merely a process of revenue-generation for government, often by shuffling of portfolio in public sector either through 'cross-holding' among public enterprises or directed-holding by the government-owned all India financial institutions; that revenue generation in a few cases was obtained by assuring the investors of a monopoly-status for a number of years thus undermining competition; that autonomy was not really exercisable in practice; that financial restructuring was done at enormous cost to government and only to dress up an enterprise to avoid reference to BIFR or privatisation; that the Disinvestment Commission had been ignored; and that institutional rigidities still remain in actual reform of the state as producer of commercial goods and services. In particular, it is argued that unbundling of so-called natural monopolies has not been given attention while diversifying ownership. Notwithstanding the above criticisms, a workable framework for reform has been initiated and undoubtedly further progress requires a significant thrust.

Regulatory State

While there were attempts to reduce the role of the state as a 'producer', correspondingly there has been deregulation in some and expansion of the state in other as a regulator. Dismantling of industrial licensing and liberalisation of trade are best examples of retreat of a regulatory state. But, in many other areas, there has been expansion. For example, in telecommunications, in the area of ports and electricity, national-level regulatory authorities under appropriate statutes have been established. Similar initiatives are being considered in some other sectors also. The regulatory authorities are expected to exercise independence from the ministries or a public or private enterprise concerned and provide a frame-

work for entry and operating conditions, especially tariff, in a way that would provide assurances and protection to investors and consumers, whose interests often conflict in a monopoly-like situation.

Though at a macro level there has been deregulation, it is often argued that there are still a plethora of regulatory clearances that are required, thus undermining the full impact of deregulation. The process of expanding the regulatory role is sometimes described as incomplete, if not inadequate, on the ground that the constitution of regulatory authorities is not necessarily apolitical or designed to counter political cycles; that they are being undermined by the ministries concerned either on account of narrow interests of public enterprises or to serve what the ministry perceives to be the larger public interest; and that the regulatory authorities are inadequately provided for, in regard to physical, financial or human resources, to perform their task efficiently and effectively. However, it is undeniable that a basic framework for a more transparent, accountable and expanded role of the state as a regulator has been put in place in many crucial sectors, though focused attention to the strengthening of these authorities may be necessary. More important, there may be many other areas, in particular, an overall competition policy, customer-protection (especially compensating customers for negligence of producers of goods or services in public or private sector), setting minimum acceptable levels of standards in services sector, restrictive practices adopted by trade unions affecting consumer interests, etc., that need to be pursued further.

Facilitator State

In the state's role as a facilitator, the major thrust is to redefine what constitutes a true public good and then find the means by which such a public good is funded and provided for in an adequate and equitable measure. It is also possible to unbundle an existing public good into its true public good and commercial components. It is ensuring provision of a public good that is relevant and not necessarily whether state does it on its own or through use of the private sector.

The evidence available on review of scope and coverage of public goods by the central government is rather limited except perhaps in the context of roads and bridges where toll charges have been introduced. A detailed framework for review of what are public goods, how to assess adequacy, how to ensure provision and means of

adequate financing need to be addressed by the state as markets cannot respond to these questions. For example, there can be a policy decision to treat a unit of delivery of a good as a public good as distinct from another way. Further, water supply in a street tap may be a 'public good' while water supply in a tap at home is a pure commercial good. It may also be recognised that a significant part of provision of public goods falls in the jurisdiction of provincial governments and not the central government. Overall, there is a significant scope and a need for review of the states' role as facilitator.

Welfare Provider

While in some developed countries, the major source of fiscal stress and consequently the major area of reform has been revamping or cutting down on the role of the state as a welfare state, in India there is a large consensus expanding rather than contracting role of the state in the provision of welfare. In consensus covers entitlements such as primary education and medical attention as also old age pensions. In fact, the Constitution mentions compulsory primary education as a Directive Principle of State Policy, though the actual performance of the state has admittedly been inadequate. A study of the process of providing welfare, say, though primary schools do provide some insights into the current reshaping of state and market. The approach so far has been for government to build and run most of the schools, often in a centralised fashion from the provincial headquarters, prescribe syllabus, print, subsidise and distribute textbooks on a government monopoly basis; recognise and then fund, to a substantive degree, the private sector institutions also. In some cases, mid-day meals are provided in elementary schools, while in a few cases cash in respect of female students is being provided. Reform progress in this regard has not been uniform among the provinces though recent initiatives relate to provision of adequate buildings and teaching material, increasing the number of teachers in the government sector and a few provincial governments encouraging local initiatives in starting or running schools.

There has been widely expressed discomfort at the relatively low level of expenditures on education. However, it has also been pointed out, most recently by C Rangarajan, that the level of government expenditure on education in India is comparable to Sri Lanka or China and hence the inadequacy is not in the

level of public expenditure on education. It has also been recognised in various empirical studies that in some states two-thirds of primary school teachers in government schools do not attend the school and in many provinces textbooks are made available in mid-year only. There is a marked preference for private schools among most parents and a few studies show that literacy is increasing in India on a demand-driven basis rather than utilisation of supply created in the government sector. While it is possible to argue that those who can afford should be persuaded to pay school fees, often government schools are not preferred by those who can pay. Similarly, while efforts are made to regulate the fee structure in private schools, they are often circumvented. The relative roles of government, the local panchayat and private initiative in regard to setting standards of physical environment, academic requirements, funding, provision, etc., are yet to be addressed. In brief, the role of state relative to the private sector continues to be inadequate and ill-defined in most parts of India, in regard to spread and quality of education, especially at the primary level. Similar logic can be applied to health or medical facilities or sanitation.

The major constraint for adequate provision of services is the *de facto* countrywide phenomenon of priority in entitlements of instruments of welfare provision (employees, contractors, etc.) over the purpose (schools, dispensaries) or entitlements of the people to whom welfare is sought to be provided. Some provinces are attempting to overcome this through effective decentralisation of initiatives and management.

Notwithstanding the above, there are some provinces which have progressed significantly while new initiatives are being attempted in some other provinces. An all-India framework, such as in 'operation black-board', for a review of the relative roles of public, private, local, and non-governmental organisations, in terms of different combinations of funding and provisioning is yet to emerge. Similarly, regulatory framework in these areas, especially medical and health services, is being developed in select provinces since private funding and provision is expanding rapidly. Improvements in what has been termed as inefficient provision by public sector and a regulatory framework to govern unbridled private sector in addition to evolving appropriate mix of funding and provision by public and private sources appear to be the reform agenda for the

future in the realm of state as welfare provider.

Provincial Level Reforms

Significant attention has been paid in both academic circles and in public debate to the challenges posed in reforms at the provincial level. These include fiscal, power, irrigation, roads and road-traffic, education, health and water supply. Different provinces have adopted a variety of approaches.

On the fiscal front, apart from revenue raising, cost recovery for services and traditional expenditure-containment, measures include statutory limit on guarantees, limits on public employment and establishment of Sinking Fund. It is necessary to recognise the fact that initiatives on fiscal front, both statutory and non-statutory are far more impressive in some provinces than the centre. In fact, substantial part of recent fiscal stress is perhaps justifiably attributed by provinces to the recent liberal pay hike by the centre. Though legally the provinces are not bound by the centre's decision, during the seventies and eighties socio-political compulsions and centralising tendencies in public systems made the centre's decisions *de facto* binding on the provinces. It is necessary to recognise that in spite of impressive initiatives in some provinces, the fiscal stress at the provincial level is acute.

In the area of power, measures relate to private sector entry in power generation; reorganisation of power monopolies into separate corporates for generation, transmission and distribution; privatisation of assets; and statutory steps for establishment of regulatory/tariff authorities. There are still many provinces which subsidise power heavily and overall the power sector is still far away from total cost recovery. Yet, in terms of organisational restructuring and legislative actions, some provinces have progressed significantly and well ahead of the central government in respect of similar activities (say, power supply or passenger transport by road in urban areas).

In the area of irrigation, stress has been on decentralisation of water management especially participative approaches and upward revision of water rates. Different provinces have adopted varying systems, but overall, however reasonable, cost recovery is yet to be seriously attempted. While progress in regard to cost recovery is tardy in most cases, the progress in institutional improvements for decentralised and user involved management has been impressive in a few provinces. Similar

approach towards decentralisation is yet to be demonstrated in the central government.

In regard to education, bringing primary education under panchayat system and local involvement in setting up and part-funding of such schools have been some of the initiatives in a few provinces. There is no evidence of any such initiatives, as yet, in respect of a large number of secondary schools under the aegis of central government.

In respect of health facilities, a few provinces have been contemplating legislation to regulate private health care facilities.

As regards public enterprises at provincial level, there have been almost universal attempts to review the portfolio and identify non-viable enterprises. While attempts to privatise have been made, there have been only a few successful cases. The public enterprises at the provincial level, other than in power, road, transport and industrial financing, are relatively of smaller magnitude in most provinces. However, many provinces have attempted a systematic evaluation of public enterprises and the hard budget constraint has been quite severe in almost all provinces. The variety of options by several provinces in dealing with state-level public enterprises is impressive.

Features of Reform Process

The major features of reform process of dynamics in India, can thus be summarised as follows:

First, the expectations from reforms in India are not in terms of across-the-board retreat of state in favour of market, but in terms of enhancing the state's capacity to permit efficiency gains and expand availability of public and merit goods.

Second, while state is retreating in some areas, such as pure commercial goods or services, it is both retreating and expanding in other areas such as regulation and is expected to expand further in public and merit goods.

Third, a variety of options have been initiated by the central government to redefine the role of state vis-a-vis market and the framework is comprehensive, though significant ground is yet to be covered. In general, the direction of reform is retreat as a producer state and retreat combined with expansion as a regulatory state.

Fourth, at the provincial level, while there is some marginal retreat as a producer state, substantive expansion and redefining of the role of state as a facilitator and welfare-provider appears to be in order. A variety of options have been exercised

by different provinces, though significant progress is required if fiscal sustainability is to be combined with an expanded role for the state at the provincial level.

Fifth, the differences in the pace and direction of reforms in different provinces are perhaps explicable by the political management of the process, technical capability to design measures, institutional underpinning to implement them and nature of support from central government.

Sixth, there is evidence to show that, even in areas where the state has to expand, mainly at the provincial level and as a welfare provider, decentralisation of initiatives and management away from the provincial head-quarters down to local levels seems to be a preferred option. This would imply that the state may reorient and expand by changing the degree of centralisation.

NEW BALANCES

The descriptive account of the evolution of the mix between state and market in India, with special reference to process of recent reforms, reveals many interesting aspects, especially of the nature of changing mix relevant to us, as also the variety of options exercised. It also reveals the significant progress yet to be made, though a preliminary framework is available. However, to assess the dynamics of the changing mix, it would be useful to track what may be termed as new balances that are emerging as both causes and consequences of a changing mix between state and market. The changing balance between state and market does not happen in isolation, but is related to other balances also. An attempt is made here to track these new balances in a somewhat exploratory fashion or even as conjectures. These balances are vertically between centre and provinces; horizontally between provinces; within governments, both central and provincial; between public and private sectors; funding and provision in delivery of services; old and new industrial houses; poor and non-poor, organised employment and self-employment; and finally rural and urban.

Vertical: Centre and Provinces

As the reform progresses, it appears that the relative balance between centre and provinces tends to tilt in favour of provinces for a number of reasons.

First, the most important areas of the central government's responsibilities are in international trade, financial sector, telecommunications, aviation, and especially banking and corporate law/practices. In most of these areas, factors

such as multilateral agreements (say, WTO), globalisation and recommended best practices of the world tend to circumscribe, over a period, the discretionary power available in normal times to the central government. Second, the capacity of the centre to reach tax levels as well as tax regime very different from international practices (customs, excise, corporate or income tax) also tend to get constrained over a period, since the free and rapid flow of commodities, skills and finances among the countries would require us to be not too much out of alignment.

Third, major thrust-areas needing expansion of state are in physical infrastructure such as road, waterworks, power and social infrastructure, such as, schools and hospitals. Whether it is direct intervention or indirect intervention, the regime that governs funding and provision in these areas is to be determined by provincial governments. Thus, relative to the centre, the provinces are currently in the expansionary modules of the state in the state-market mix. Provincial governments currently have more freedom to access resources for financing economic growth from the market both from domestic and in some ways global sources. Hence, the proportion of net official flows from centre to provinces as a proportion of total capital flows to provinces tend to get reduced.

Fourth, provinces could also seek advice on growth strategies not only from the Planning Commission as in the past, but also institutions like Institute of Public Finance and Policy or Asian Development Bank or the World Bank.

Horizontal Inter-Provincial Imbalance

The balance, especially, economic balance among the provinces is also likely to be affected to the extent the overall governments' role in allocation of resources tilts in favour of markets. Thus, provinces will be competing more intensely than before in the market place for resources in future and may find it somewhat difficult to place a significant responsibility on the centre for their relative performance.

Second, with growth in communications especially on economic and financial issues, people will tend to benchmark economic performance of states. There may be a slow beginning but the momentum could pick up, as evidenced by varying capacities (both in terms of amounts and interest rates) to raise financial resource for provincial level public enterprises, on the basis of their guarantees.

Third, there are a variety of options for managing change which are adopted by different provinces. For example, a single

Electricity Board for each state was an earlier model, while now each province is looking for its own model combination of institutional arrangements as well as transition path. There are plenty of opportunities to learn from each other's experiences and make modifications. Thus, inter-provincial interaction tends to be more intensive, by themselves or through institutional consultants who may be interacting with several provinces.

Fourth, there is, in the decentralised scenario, a potential for increasing the divergence in level of income among provinces or even intra-province. To this extent, there may be pressure from less developed provinces on the centre to play a more active role in countering markets' possible neglect of less developed provinces.

Fifth, there could be competition among provinces to benchmark, reform and excel but the new balance will have to ensure healthy competition.

Within Governments

The balance between ministries representing the combination of political executive and government bureaucracies vis-a-vis exercise of ownership functions as well as regulatory functions may also change somewhat adverse to ministries. The process of privatisation, diversified ownership and autonomy of public enterprises may erode the discretionary element of the ministries. Once separate regulatory bodies on statutory basis are established and strengthened, they are meant to be semi-autonomous. Often their membership need not coincide with political cycles and this may impart greater stability to regulatory regime. Increasing role of semi-autonomous regulatory bodies tilts the balance away from the ministries and in favour of local utility in policies.

Further, experience at the provincial level in some areas has shown that the preferred route to enlarging role of and efficiency in the functioning of state is decentralisation in government. For example, in primary schools or other management, the approach in some provinces seems to be through decentralisation or localised water users' committees or village panchayats. This may also involve emerging new balances between ministries or departments at provincial headquarters and local bodies, in favour of the latter.

Public and Private Enterprises

The relationship among public enterprises and between public and private enterprises could be subject to new balances in several ways.

Firstly, a large public enterprise sector may continue but it will have to reckon with growing competition from private sector.

Second, regulatory agencies may insist on level playing field between public and private sector.

Third, the public enterprises faced with hard budget constraint, threat of private sector entry and accountability to private shareholders where they exist may have to carve out new patterns of relationships with the government and within the organisation.

Fourth, strategic co-operation and cross-holdings between public and private sectors are inevitable, thus replacing watertight compartmentalisation between the public and private sectors. In fact, this process may necessitate the termination of the concept of government companies under the Companies Act.

Finally, managerial and other highly skilled people, who were concentrated significantly in public enterprises may find alternative and attractive avenues in private sector; and consequently their clout within public enterprises may tend to improve. The emerging flexible market for talent could indeed alter balances between and within enterprises.

Funding and Provision of Services

There can be several permutations and combinations of public funding, private funding, mandatory cross-subsidisation in private funding, private provision, public provision and mandatory provisions by private to meet public interest, etc. A recent example of private funding and private provision with some elements of public funding and regulation has been evolved by the Supreme Court of India in respect of private engineering colleges in Karnataka. The scheme covered fees chargeable, mix between merit vis-a-vis discretionary seats in admission, local vis-a-vis non-resident Indian quotas, etc, and mandatory loaning by public sector banks at concessional interest rates. While the decision of the highest court provided a framework in a specific category, there are large areas, drinking water supply, education and healthcare, where public-private mix is entering new balances in regard to ownership, funding provision, official recognition and governmental regulation. The traditional watertight division between government or public and private sector each combining within itself funding and provision may get blurred and larger scope realised for intermingling of the two. Further, such intermingling may involve non-governmental organisations

as well as local initiatives. These are perhaps in nascent stage but evolutions of new balances between public and private sectors is clearly in the horizon.

Old and New Industrial Houses

The traditional core industries in the tradable sector, especially sectors which enjoyed high levels of protection in the past, are currently under pressure of competition and they tend to be apprehensive of rapid reform. They are often balanced by the newly-emerging internationally competitive industrialists, in areas such as drugs, pharmaceuticals, software, chemical industries, etc. As the latter improve in strength and importance, the balance will tend to tilt in favour of more rapid reform. There is evidence of a tilting balance even now. Even within the traditional industrial houses, one can see changing balances in the composition of activities, boards and management.

Poor and Non-Poor

A major issue of concern in the context of reform is whether the poor will be worse off than before in absolute terms due to the reform and whether the balance between poor and non-poor, in relative terms, will worsen as a result of reform. In the pre-reform period, there were programmes in the name of the poor but their reach and benefits were often questioned. Given the stalemate in state action that has been explained, the poor may not be worse off than before and may even be able to articulate their needs better in the absence of bureaucratically determined services, though commercialisation of services may tend to give a sense of relative deprivation to poor. Perhaps this is an emerging area of new balances, with a significant social dimension that needs to be analysed and feedback utilised in policy actions.

Organised Employment and Self-Employment

In the fifties, sixties and on to the seventies, the major segment of engineers, doctors or other skilled professionals coming out of colleges found jobs in government or public enterprise or publicly-owned financial sector. However, since the eighties a progressively larger percentage of the skilled and the articulate tend to be in self-employed category as against employees category. The growing services sector also adds to this trend. Indeed, leasing of goods and services, contracting out or outsourcing instead of in-house provision are considered to be more suited to changing times. In democratic systems, these changing balances

between job-orientation and work-orientation tend to exercise a strong influence on the policies relating to employment in the organised corporate sector.

Rural-Urban

Contrary to the generally held fear that reforms would lead to markets holding sway and thus metropolitan or large centres would thrive to the disadvantage of rural areas, there is evidence that rural prosperity has been improving significantly in the recent years. The rural-urban continuum would perhaps assert itself, but in any case rural-urban as well as agro-industry linkages are set to get strengthened especially when the services sector is growing rapidly. Briefly stated, there may be new balances replacing the traditional rural-urban divide or dichotomy.

Role of RBI

Before concluding, it is useful to place on record how RBI is responding to the emerging new balances. This will be illustrated by RBI's recognition of the fact that finances at the provincial level are critical to the realignment of the role of the state and market.

First, the RBI has started a close and more intensive interaction with the finance

secretaries of provincial governments on a regular basis, and on a wide range of relevant subjects.

Second, a committee of provincial finance secretaries has, with the active involvement of the RBI, recommended limits on government guarantees. Some provinces, such as Karnataka, have already legislated on this subject.

Third, the system of ways and means advances to governments has recently been revised by the RBI in consultation with the provinces to introduce better incentives with regard to financial and cash management.

Fourth, with support from the RBI a committee of finance secretaries of provincial governments is presently working on the issue of improvements in transparency of the budgetary system.

Fifth, provinces have been encouraged by the RBI recently to access the market for a part of their market borrowings. These include Andhra Pradesh, Uttar Pradesh and Punjab which have raised funds directly from the market.

Sixth, in view of this development, the issue of monitoring of the financial health and other relevant parameters of the provincial governments by the market assumes greater significance. A committee

of the finance secretaries of provinces is currently acting in an advisory capacity to oversee the indicators of financial parameters being developed by RBI.

Finally, the RBI is actively advising the provincial governments in areas such as cash management and funds management.

Conclusion

To conclude, the concept of mixed economy that was adopted was the right one. What is called for is a dynamic and bi-directional movement between state and market. Indeed, growth in technology has recently led to drastic redefining of the relative roles of state and market and such a redefinition need not be a unidirectional retreat or a across-the-board expansion. The reform process in India has been able to capture the basic elements of this complex reality and there is, at least at a conceptual level, a pragmatic framework. More importantly, there are emerging new balances and a dynamism has to be located in these new balances. Analysts need to have an appropriate understanding of these emerging new balances to appreciate the stability and pace of economic reform.

[This essay is based on the author's address at the Indian Institute of Economics, Hyderabad, on August 16, 1999.]

भारतीय विदेश व्यापार संस्थान INDIAN INSTITUTE OF FOREIGN TRADE

RESEARCH FELLOWSHIP PROGRAMME

OBJECTIVE : The objective of the Fellowship Programme is to provide facilities for advanced studies equivalent to doctoral level in international trade and business.

FOR WHOM INTENDED : Admission to the programme is open to research scholars, members of teaching faculty in institutes of higher learning and universities, officials of central and state governments and professionals in private sector.

ELIGIBILITY : The eligibility for admission to the programme is a Master's Degree in any discipline from a recognised University or Two - Year Masters Programme in International Business from IIFT and appropriate work experience of minimum two years.

SELECTION : Short - listed candidates will be invited for interview in Delhi. Candidates will appear in the interview at their own expense.

HOW TO APPLY : The application giving details of age, qualifications, experience and a synopsis of the proposed research topic in not more than 450 words accompanied by a crossed demand draft of Rs. 500/- (non-refundable) drawn on a nationalised bank in Delhi in favour of Indian Institute of Foreign Trade should reach the Dean (Research) INDIAN INSTITUTE OF FOREIGN TRADE, IIFT Bhawan, Qutab Institutional Area, New Delhi - 110016 before 30 November, 1999.

Tel : 6965124, 6965051 Fax : 091-6867841, 6853956, 6867851

IIFT - Where excellence is a way of life

Globalisation of Steel Industry

A S Firoz

The Global Restructuring of the Steel Industry: Innovations, Institutions and Industrial Change by Anthony P D'Costa: Routledge, London and New York, 1999; pp xx + 228, price not mentioned.

THE world had seen unabated appetite for steel in the post-war period. In the oil crisis of the early seventies. In response, steel production worldwide continued to grow rapidly in a rather assured market till around 1974 when the first real recession gave a jolt to the basic foundation of the industry the world over and more so the developed world. The questions of overcapacity, technology, ownership – all came to be raised as the industry realised that the conditions of continuous and secular growth in the industry cannot be taken for granted.

After the oil crisis, up and downs in the fortunes of the steel industry became common and again more so in the developed world. Although the industry in the rest of the world has not been totally isolated from the vagaries of the market, the early entrants (the ones in the developed nations) faced more of them. It is not merely the cyclical turbulence in the industry since the seventies or is talking about. Over the decades, including to some extent the fifties and the sixties, round developments in the industry worldwide have altered the competitive positioning of the nations producing thick critical industrial intermediate to such an extent that today the industry's map looks significantly different with global relocation of the industry along with massive changes in technology and trade.

The developments in the industry in the last four decades have been more significant. These four decades have not only seen global steel output increasing substantially, but also a rising share of the developing countries in steel production. The decades have witnessed a massive relocation and restructuring of the industry. There are new players emerging every day making survival of those early generation producers, for example, in the US, increasingly difficult. The US steel companies were challenged by those in Japan and western Europe. Then came the new steel-active countries – Korea, Brazil, Mexico, India, etc. China on the other hand continued to grow unperturbed by externalities. The development of the industry has been so widespread that today the number of countries producing basic steel has gone up many times. In these

changed circumstances, the erstwhile steel majors have lost, partially or fully, their position of eminence as steel-makers, displaced mostly by new companies of varying size from a large number of countries.

Why the early entrants like the US lost their hold and why Korea and Brazil are more deeply rooted and growing players in the world of steel and what are the primary factors that reshaped the global competitive scenario in the last four decades remain matters of dispute among researchers. There are many angles from which to look at the fluctuating fortunes of the industry in various nations. The specifics apart, much of the development of the industry was guided by a simultaneous and interactive development of market and technology. While the market and technological innovations and developments cannot be put in watertight compartments, many feel that these factors also have identities of their own and each on its own forms the guiding force in the process of development of any industry or economy.

One of the most important points Anthony D'Costa has made in the book under review is that technological changes in the steel industry over the years have had a profound impact on the nature of competition which in turn and also simultaneously defined the contours of global restructuring and relocation of the industry. He argues that in the rapidly changing technological parameters of the industry, there were laggards like the US that could not adjust to fast changing conditions to be outpaced by the more dynamic and younger steel producers like Japan and Korea.

What is reorganisation and restructuring of an industry? Anthony D'Costa provides various abstract concepts. According to him, global restructuring "refers to the process by which steel-making capacity is being spatially reorganised across nations". That is the process of spatial relocation of the industry – reflecting uneven growth across regions and countries. Simple. Then he goes to say "restructuring also refers to the various ways by which a national economy adjusts to the capitalist imperatives of competition, profitability, market control and national development".

More specifically he says, "restructuring is viewed as a complex process by which the steel industry is evolving as a result of technological developments, corporate strategy and government policies". D'Costa then says "with innovations and diffusion of technology at the core of capitalist industrialisation, restructuring of the steel industry globally can be conceptualised in terms of different technological trajectories". From abstract to more concrete forms, there seems to be a lot of unnecessary confusion in regards to what is meant by restructuring. In fact, given the basic thrust of the book, and at the end of it, one wonders whether there was any need for developing such a complex analytical structure to make a very simple point (stated above).

In this book, the author has taken three basic aspects of the industry for discussion: technology change, relocation and change in ownership and entrepreneurship. Of this, he attaches primary importance to the first for the global restructuring of the industry and then attempts to debunk the 'the logic of the market'. The global restructuring, means global relocation of production, capacity and investment and technology change incorporated in various of processes of production, scales of operation and integration. The changes in any or all of these aspects are visible more from the factual details. Therefore, the point that the author makes at the end of the study requires to be weighed more concretely with facts and figures. One does not need any great deal of analytical rigour for that.

If the US built up a massive steel industry, Japan and Korea came up later to destroy its comfort with newer and technologically superior plants that could produce steel cheaper and even better in quality. As a result, steel production moved out of the traditional areas like US and Europe to Asia and Latin America: Korea, Japan, India, Brazil, etc. more specifically. D'Costa argues that the US industry was slow in introducing and absorbing new technologies as it could still carry on with some degree of comfort with its relatively outdated plants. It invested just enough to keep the old units running. The consequent technology gap that it ended up with was too much for it to remain competitive in the global market.

D'Costa traces correctly the US steel industry's lukewarm response to new technologies and he is right when he says that as a result of this the US steel industry fell far behind Japan and Europe in technology. Coming specifically to a comparison

with the developments in Japan, there were three major areas where the new Japanese industry scored over its American counterpart. It built large blast furnaces to derive better economies of scale. It introduced state of the art larger size basic oxygen furnaces (BOF) to replace the older generation inefficient open hearth furnaces. Then it stroled ahead in introducing continuous casting technology in Japanese plants. In 1973 (data were not immediately available for earlier period and hence the choice of the year) the average production of pig iron per year per blast furnace in Japan stood at 1,540 thousand tonnes, while the corresponding figures for the US and Germany were 589 and 479 thousand tonnes respectively. In the same benchmark year, 20.7 per cent of the steel produced in Japan was put through continuous casting – the corresponding figures for the US and European Union were only 6.8 and 9.4 per cent. These had put the Japanese ahead of the rest in terms of material and labour costs in production. D' Costa in fact revives in his book a debate precisely on this subject that had taken place in the sixties. His efforts to bring in the aspects of technological change and its impact on the global restructuring of the steel industry, especially in the light of the subsequent developments in the eighties and nineties, are interesting and make his book absorbing reading. Although he admits towards the end that market forces also had a major role to play in all that happened and that it was more a matter of relative importance of the technology-related factors that he wants to bring to the front, there is no doubt that his position finally taken runs the risk of overemphasis on a relatively narrow lane.

Over the years, steel, like many other industries, has seen significant strides in technology. These developments were in the basic as well as in the secondary (processing) areas. As a result, the world has seen a gradual decline of integrated steel-making (from iron ore using blast furnaces, sinter plants, coke oven batteries and then using the iron thus produced to make steel in a BOF or OHF and subsequently rolling the steel thus produced into various shapes) giving way to electric steel-making in a furnace using various mixtures of scrap of steel, direct reduced iron or even pig iron. In fact, the electric arc furnaces (EAF) meant basically to re-melt scrap of steel have graduated to a different plane with the emergence of direct reduced iron (DRI, also known in different forms as sponge iron or HBI). Today, there are integrated operations of DRI production from iron ore and then the same being used for steel production in an EAF. In the process of rolling also, there has been path-breaking

technological progress. The technology of thin slab-casting, for example, has had a profound impact on the steel industry. With the innumerable changes taking place in the steel industry, the relative competitive position in steel production all over the world has shifted significantly. This has once again changed the competitive balance of the global industry.

D' Costa has put together the experiences of the industry in the sixties and seventies. His study covers well the historical development of the industry in each important region in that time-frame. But the eighties turned out to be different and the nineties more so. The laggards of the sixties, the US, for example, took the lead in adoption of new technology. The first thin slab casting plant came up in the US. The first iron carbide plant was set up, though in Trinidad and Tobago but by an American company, Nucor. The more competitive electric furnace units (known also as mini mills) spread faster in the US than in other countries. The dinosaurs of the US steel industry became extinct and the new breed of cost efficient and modern plants now are the backbone of the industry. Against this, the behemoths that enjoyed economies of scale in Japan are in deep trouble despite the fact that every conceivable effort went into modernisation of the large blast furnace-based plants. Many could not stand up to competition and folded up. The Japanese industry, following the global trend, is now gradually shifting to electric steel-making. (This is not to say that the older integrated plants are being closed, although their share in total production is falling.)

D' Costa says that the US should have gone for larger blast furnaces. The Japanese did. The problem is that a huge 7-8 million tonne plant having 4,000 cubic meter plus blast furnaces may be more efficient than a few smaller ones put together to get the same output. This is when the market is assured. The problem is that when competition is high and the full capacity cannot be utilised, a large plant becomes a liability. The unit costs of production go up. As against this, a smaller plant is more flexible and fares better in bad times. Therefore, the point of comparison is important. In the sixties and seventies and in fact even in the eighties there were more number of years when the steel industry globally had fared well and saw steel demand going up in a more or less secular trend. In the nineties it has been the reverse. Global steel demand has grown but not steadily. There are more bad years now than good ones. Therefore, the large plants enjoying economies of scale which did reasonably well in the sixties and seventies are in trouble since the eighties and especially now.

But the main problem still is not the choice of smaller or bigger blast furnace-led technology route. The main technological issue is whether to have a traditional integrated plant or go for electric arc furnace-based plants with or without DRI facilities. The question today revolves around the technology to produce the required metallics and then the kind of rolling mill needed. The large blast furnace-based giants have been killed not by the smaller integrated plants but by smaller mini mills. The problem in the steel industry is that one cannot bring in and take out plants and machinery at will to accommodate new technologies. Steel industry is highly capital-intensive. If a blast furnace is to run for a couple of years only, then forget about putting your money on it. No investment proposal can actually show any kind of profitability if the life of the plant and machinery is reduced to such levels. An integrated plant's life is measured in decades. Therefore, once the basic facilities are set up, the only option that is generally left for the owners is to incorporate process changes.

Getting back to the question whether it was necessary for the US industry in the fifties, sixties and seventies to go for large-scale modernisation, the issue is not that the US steel industry was reluctant to incorporate the latest technologies or lethargic to adapt to global changes in the technology revolution. The point is whether it was economically sensible to go for huge investments in industries with facilities yet to see obsolescence. The US industry in the sixties or seventies continued to have a remarkable superiority in operational performance measured in terms of labour productivity, raw materials consumption and energy use over most others, except perhaps for Japan. The US industry did also invest in upgrading facilities. Modern technological processes were retrofitted wherever possible and found economically viable. But the fact remained that even if the ultramodern Japanese plants did have the advantages of lower raw material consumption and better labour productivity, they faced very high financial costs (interest and depreciation) in producing steel. Therefore, it continued to make sense for many of the US mills to operate the older depreciated plants.

There were two factors that retarded the development of the steel industry in the US. One, there was a belief that steel after all was a sunset industry and that American capitals should go to more profitable sunrise and potentially stronger industries like petro-chemicals, pharmaceuticals, computers, telecommunications and electronics. The steel industry by the sixties

had started showing declining profitability and by the middle of the seventies faced massive shocks. The billions of dollars the US steel industry perhaps required for a thorough technology upgradation was certainly not there. The fall in profitability of the industry left only a life in the form of the company's own money for investment. The dwindling prospects of the industry would have made it extremely difficult to tap public funds. Therefore, in the absence of support from US financial institutions and shareholders' confidence, the American steel companies could not undertake large-scale investments incremental gains from which could be only marginal. Although there was a natural tendency to increase capacity every time there was a steel boom, mainly elsewhere in the world, the US industry refrained from such impulsive actions and as a result capacity growth was taking place in the Europe, Japan and various developing countries.

The growth of the steel industry outside the US was determined by four factors. One, technology flow improved significantly and as a result the latest innovations were available to an interested party anywhere in the world (of course at a price). Two, labour costs in developing countries and Japan were significantly lower than in the US. Therefore, combined with the latest in technology, it was possible for many countries to produce steel competitively not only for the home market but also for exports. Three, much improved shipping made it possible to move raw materials from one country to another at affordable costs. Therefore, the countries not benefited by their own raw materials like iron ore and coking coal could still think of producing steel. This was the case with Japan and Korea. Four, of course, the thinking in many developing countries, rich in raw materials, that they should add value to their raw materials by producing steel mined ground. Steel industry thus saw a growth in India, Brazil, etc.

The US steel industry, in spite of having some of the best operational achievements, could not compete with the Europeans, the Japanese or the Koreans because these countries had a tremendous advantage due to their relatively weak currencies. Their exports needed their currencies to be weak to remain competitive. They also required government subsidies in many forms (including low cost capital for construction of plants). All these benefits were abundantly available and that made it nearly impossible for the US industry to stand up to them. Throughout the late seventies and early eighties, the US steel industry had to fight a host of anti-dumping

and subsidy cases in their homeland. The question of the US industry expanding for the world market was literally written off.

Once growth prospects were found limited, the US industry could not think of expansion lines to exploit larger economies of scale by adopting features like large blast furnace operations as did the Japanese. In fact, so unwilling was the US steel industry to modernise itself in the late seventies (when it really needed to) that instead of setting up brand new plants to replace the aging ones, the industry either closed many plants and allowed foreign capital (largely Japanese) to restructure others. The restructured plants, known later as 'reconstituted mills', did perform better than their earlier plants but were definitely not a patch on the best then globally available.

Despite extensive differences in opinion among experts on the question of appropriate technology for the US steel industry, a view that was strong was that a piecemeal approach to modernisation of the old steel plants was no good and that the best results could be achieved from those technological innovations only in a greenfield plant. Experience since then confirms this. Therefore, the assertion of D'Costa that it was technology that put the US industry behind is not entirely acceptable. In fact, historically, the US steel industry has never been averse to innovation and new technologies. The situation in the fifties and sixties was such that any move to abandon the working plants and replace them by new untested and untried technologies would have been an enormously costly affair and also economically risky considering the growth of cheaper steel production in Europe and Asia. In the eighties and nineties, as noted by D'Costa, the US industry took the lead in expanding electric arc furnace-based smaller 'mini-mills' for more profitable operation and investment. All those integrated plants that survived in the US concentrated more on product development and quality and so remained in business despite stiff challenge from the low cost producers, taking advantage of huge innovations in process technology and especially in the areas of rolling.

The US steel industry suffered more from the country's trade policy than anything else. The US, taking the lead in globalisation, faced a surge of cheaper imports, while countries like Japan and all those in the developing countries continued with their protectionist policies. Imported steel that accounted for less than 2 per cent of total consumption of steel in the US increased to over 20 per cent in the seventies. Today the figure is even higher. This did not happen in Japan or for that

matter in any country in the world that had so much of steel capacity of its own.

In the entire analysis of the process of restructuring of the steel industry in the US, D'Costa sees technological change in the industry coming from existing players by way of replacement of obsolete facilities. In fact, that seems to be a very skewed perception. Technological change in an industry takes place through new investments by new players. Very often this replaces not only the older plants but also business entities. A new generation of entrepreneurs takes over from the older one. In India, for example, although the traditional players, SAIL and TISCO, did a lot to modernise themselves, the real new technologies are being brought in by greenfield investment projects by new players like Essar Steel, Ispat Industries and Jindal Vijaynagar Steel, etc. It is Nucor that took lead in the US. The problem that was before the steel industry in the US in the fifties and sixties is precisely there for SAIL today in India. Can we expect SAIL, and for that matter even TISCO, to go all out getting themselves equipped with the latest in the world just because the new technologies are better and they can reduce their operational cost and improve quality? Ultimately, steel is produced to sell at a profit. Investment has a cost. That has to be taken into account. In fact the approach TISCO has adopted in its bid to remain globally competitive is admirable. It may not have all the bests in modern technology, only some of them, just enough to keep itself cost competitive.

It is difficult to draw a line between developments in the industry taking place due to technological innovations and those due to pure economic factors. After all, technological innovations are not divorced from market needs. From laboratories to large industrial plants, technology passes through rigorous tests of financial viability. Steel industry has of late seen a surge of laboratory level or larger research findings that promise to change the technology of steel production once again. But only a few of them have passed the test. Despite efforts by steel companies globally with millions of dollars sunk in these ventures, the acceptability of new technologies has remained low. Nobody can be accused of being averse to new technologies. The hard reality is again that if commercial viability is not established, these ideas will remain only of academic importance. At the same time, millions of dollars are being spent regularly on research and development so that production costs can be lowered through reduction in consumption of material resources and use of labour. Here again, nobody is doing research merely for academic interest.

D'Costa makes another important point, when he says, "For most developing countries acquiring modern technologies has been difficult either because their markets could not support them or because the suppliers from the advanced capitalist countries have shied away from such markets. As we have seen, the cumulative outcome of uneven diffusion of technology is varying competitive strength and consequently the global reorganisation of steel-making capacity." Does it include experiences in Korea, Brazil or India? Certainly not. Korea and Brazil had access to the best of technology available and the same was well supported by the global market.

While the author tries to develop a strong analytical and empirical basis to debunk

the logic of the market, one is left wondering whether he has taken a complete view of things. In his entire analysis of the problems of global restructuring of the steel industry, the role of national governments, their trade policies and financial support and the resultant excess capacity all over the world in the subsequent period have been grossly underplayed. Although modern technology was important in determining the competitive position of the industry and its relocation, the same was only derived from the host of compulsive national economic factors shaping investment flow into the industry in various countries. The laggards like the US were actually victims of globalisation of the industry rather than of any short-sighted business decision.

Dalits and Their World

Valerian Rodrigues

Dalits in Modern India, Vision and Values edited by S M Michael; New Delhi, Vistaar, 1999; pp 353, Rs 425 (cloth).

COMPILED volumes on dalits have been proliferating in the last decade or so as political dynamics, electoral politics, non-governmental initiatives and, to some extent, social mobilisation have begun to focus on this constituency. Unfortunately, the same period has seen few full length studies, with years of toil and reflection behind them, on this social segment. The 'quickies' in the market-place do not have the responsibility of presenting a coherent and wholesome version of the subject matter they promise and substitute an assemblage of fragments in its place. The urge to instant limelight often masquerades itself as collective scholarship.

Compared to such rubble, *Dalits in Modern India, Vision and Values*, has much to recommend for it. There are several combative and exceptionally insightful papers in this volume. They are brought together in honour of Stephen Fuchs, one of the pioneering scholars on dalit studies with such masterpieces as 'Children of Hari' to his credit. S M Michael, the editor, offers a long introduction familiarising the lay reader on the long drawn and complex debate on caste and untouchability. Still the work lacks a normative focus which it claims through its subtitle, 'Vision and Values'.

While there could be some justification for the way the papers are organised in this volume, one could read these essays, probably more profitably, through a framework other than suggested by the editor. First, there are a series of papers which are contesting mainstream explanations in their respective spheres. Secondly,

there are those papers which enrich our grasp of social reality by focusing on those facets which have hitherto eluded us or which social dynamics has thrown up for reckoning. This is in spite of the widely accepted position that the borderline between contestation and *de novo* explanation is very thin. Thirdly, there are the narratives which want to situate the dalit project within a larger perspective.

Gopal Guru, John C B Webster, Mahesh Gavaskar, S Selvam and to some extent Gail Omvedt, find mainstream explanations wanting and implicitly or explicitly suggest their re-ordering or reformulation. New social developments and impact of policy measures on social relations are considered by K P Singh, Arjun Patel, Shyam Lal, Tarude Pillai-Vetschera, Robert Deliege, B L Mungekar, S P Punalekar and Richard Pais. Srirama and S M Michael attempt to place the dalit concerns in the perspective of history and agency.

Gopal Guru in a very perceptive essay looks at the thesis of relative deprivation that has dominated Indian sociological discourse, both to understand and prescribe for the dalit constituency. Without wholly rejecting the thesis, he argues that it was inadequate to grapple with the dalit predicament although it made sense of the reservation policy and the upward mobility of a section of dalits. However, in the existing conjuncture, relative deprivation as an intellectual construct to make sense of the dalit situation has become obsolete as dalits are left with no option but to be an oppositional element. Even if one were to concede to this argument, Guru, does

not engage with the hiatus that exists between the objective conditions that he enumerates and the perceptions of the vast majority of dalits. John C B Webster draws our attention to the complicity of the national movement, colonial ideology and mainstream historical discourse. He feels that this discourse has confined the dalits to a communal framework rather than make the issue of their emancipation the central national question. Mahesh Gavaskar feels that the social structure of India needs to be taken into account rather than merely parroting fashionable trends of constructivism that dominate contemporary social science discourse today. "If it were not, there would have been no need for Jotiba Phule to throw open the well in his courtyard to the shudras and atishudras in 1869" (p 83). Further Phule's project of transforming civil society rather than merely pursuing political power re-articulates the nationalist agenda differently. S Selvam contends against 'sanskritisation' and 'structuralism' modes of explaining the social dynamics of India as epitomised by the works of N Srinivas and Louis Dumont respectively. He finds hegemony more appropriate to understand the socio-political process in India. Selvam, however, does not recognise that hegemony may be long on explanation and short on radical practice envisaged as the imperative need of the conjuncture by Guru. Gail Omvedt looks towards Ambedkar for a message to get engaged with the globalising drive confronting us. She finds that Ambedkar's economic thought went through three stages – liberal and anti-imperialist, socialist, and finally, equalitarian and communitarian – suggesting implicitly that the last strand is, probably, more appropriate in a globalising world. Omvedt, however, does not integrate this strand adequately although it remains a fashionable normative persuasion in the west today.

K P Singh finds American racism, in many ways, akin to untouchability in India, although there have been not many takers to such simple equations in the past. Arjun Patel traces the process of Hinduisation of the tribals of south Gujarat and the entrenchment of various 'indigenous' organisations in the region which has resulted in the displacement of crucial elements in adivasi way of life with elements of Hindu way of life. Shyam Lal, in an interesting essay entitled, 'Asprasyekaran-dalitisation', traces the multi-pronged process by which the upper castes came to be degraded to be untouchables across time. It sounds like sanskritisation in reverse and thereby subject to all the criticisms such a stand exposes itself to. Tarude Pillai-Vetschera, from her field study of Ahmednagar in Maharashtra, finds that dalit women have

been more the victims of development than its beneficiaries. Further, she feels the need to interrogate the dalit patriarchy within dalit articulation and calls upon dalit women to initiate their own dalit movement. Robert Delige gives an account of spirit possession in Valgira Manickam village and contests the existing explanations about them. He asks the question whether spirit possession could be seen as an attempt by dalits "to break away from existing social structure" (p 269), although he himself had earlier suggested that this is a phenomenon that does not respect caste divisions. B L Munekar argues that the reservation policy is still to measure up to the criteria set by the rule of law. However, he finds that liberalisation is likely to affect the dalits the worst, violating the promise held out by affirmative action. S P Punalekar draws attention to the deplorable conditions of the rural poor by drawing his empirical evidence from four villages each of Maharashtra and Gujarat, are widely recognised as developed in official and popular reckoning. Richard Pai looks into the shifts in the pattern of employment of scheduled castes and their social recognition. Even though he has located himself methodologically within the sphere of the rewards and benefits of modern public

employment, a third of his respondents have experienced the pangs of untouchability in social interaction among peer groups.

In the narrative that Srirama constructs on untouchability and stratification in Indian civilisation there is little on either the reasons for the rise of untouchability or its articulation within the relations of the caste system. It primarily goes into the making of the caste system. The only reference to untouchability is regarding its origin around 6th and 7th centuries before the Christian era based on references to the chandalas. But chandala and untouchability might be very different phenomena as Babasaheb Ambedkar has suggested.¹ S M Michael in 'Dalit Vision of a Just Society in India' finds the nationalist project in India inadequate. However, electoral politics has afforded a certain space for dalits. He feels that a dalit vision of the nation needs to be built up on the foundations laid down by Phule, Periyar and Ambedkar. One does not however, know whether they add up into a coherent perspective and stand together all the time. It does not seem to be so. What we have, however, are boundary marks rather than substantive visions of the field.

At the end of the book certain questions become pertinent. The whole terrain

covered in this book was the field of study of Babasaheb Ambedkar. However, except for Gail Omvedt, whose topic of investigation is a specific stance of Ambedkar, the rest of the scholars do not feel the necessity of departing/building on/interrogating Ambedkar's considerations on the issues they explore. In a way they too confine Ambedkar to the non-scholarly domain as the rest of the scholarship has done. Is it possible to promote dalit scholarship today, without engaging with Ambedkar? Secondly, the hold of the formal academic discourse is heavy on quite a few contributors. They do not even pause to ask whether a discourse that is geared to sustain dominance is, *suo motu*, appropriate to investigate the dalit domain. There are huge gaps in the book. There is not even one paper marking the trajectory of the dalit movement or the contours of its political engagement. Its representative focus is primarily on western and southern India. Although the effort is laudable, dalits deserve and seek better scholarship.

MAKING INFORMATION TECHNOLOGY WORK

SHIVRAJ KUNGO

This book explains how IT can be effectively employed in Indian organizations. It outlines the factors which either inhibit or facilitate the use of IT in the India context. Dr Kanungo covers all types of organizations - private and public sector, governmental and non-governmental, product-oriented and the service industry. He explores the mechanisms adopted by Indian organizations for tapping and enhancing the potential of IT pointing to the successes and failures and the lessons that can be learnt. The rich case material provided enables the reader to experience the organizational forces acting at various levels - from senior management to the shop floor - which impact on the adoption of Information Technology.

MANAGEMENT AND CULTURAL VALUES

The Indigenization of Organizations in Asia
Edited by HENRY S R KAO,
(Late) DURGANAND SINHA and BERNHARD WILPERT

The contributors to this volume maintain that management and work activities in an enterprise depend critically on social values and indigenous management practices and organizations which exemplify the successful blending of traditional social values, attitudes and institutional norms with the demands of techno-economic systems. The result is the emergence of uniquely Asian patterns of management and organizational functioning. Providing examples from Mainland China, Japan, Korea, Hong Kong, Thailand, Taiwan and India, this book will attract a wide readership in the areas of organizational studies, management, industrial and social psychology, cultural studies and human development.

National Family Health Survey: A Landmark in Indian Surveys

Pravin Visaria
S Irudaya Rajan

What is the rationale for conducting surveys like the National Family Health Survey when there are already available reliable data sets from the census and the sample registration system which provide well-acknowledged data-base for planning and policy making? In this paper a brief examination of the data from the other surveys and their particular limitations precedes an overview of the NFHS, specifically designed to provide the information that social scientists need, and the nature and quality of the data it has generated.

THE successful completion of the National Family Health Survey (NFHS) in India during the early 1990s was a landmark in the history of collection of demographic data through surveys. Encouraged by the success of the effort and the usefulness of findings, a second round of NFHS has also been launched during the latter half of 1998. Originally, the second round was to be initiated five years after the first survey, which was conducted broadly during 1992-93. (Some minor deviations from this period are not really of much consequence and can be ignored.) Unfortunately, quite apart from the usual bureaucratic wrangles, the sanctions imposed after the Pokhran tests delayed the start of the second round. The ministry of health and family welfare was convinced, however, of the usefulness of the survey and was willing to fund it from the Indian resources. As the concerned secretary put it, in a budget of nearly Rs 2,300 crore approved for the family welfare programme for 1999-2000, it would not be difficult to find a sum of Rs 6 to 10 crore required for the NFHS II. In other words, while external funding is welcome, the NFHS II is not conditional on the availability of external resources. The same was true for the first round of the NFHS, and foreign funds were not a prerequisite for the survey.

The 10 papers included in this special issue illustrate the rich potential of the excellent data set of NFHS I for a wide variety of research studies. This introductory paper also outlines the rationale of surveys like the NFHS to minimise the misunderstanding and unwarranted fears about the presumed limitations of the NFHS. The community of scholars engaged in the study of Indian population as well as social change in India needs to look at such efforts in proper perspective.

The reasons for conducting a NFHS or its various rounds are not adequately understood. It is sometimes suggested that the Indian censuses and the sample registration system provide an adequate data base for planning and policy-making. Unfortunately, this view is not correct. To gain a proper perspective, a brief overview of the post-independence developments in the statistical data base will probably be of some help.

CENSUS DATA

Since 1947, India has conducted five decennial censuses and the plans for the next census to be conducted in 2001 are now being made. The 1951 Census was planned during the dawn of planning in the country and attempted an elaborate tabulation on the economic activities of the population. Unfortunately, the conceptual framework was constrained by the earlier notions of distinguishing between 'self-supporting persons' and others; the latter worked and earned an income but were 'dependent' on another presumably self-supporting person in the household. The feasibility of collecting such data in a predominantly agricultural economy, with a high proportion of self-employed persons, was debatable under the best of circumstances. After careful deliberations, this archaic conceptual framework was replaced in the 1961 Census by an effort to make an inventory of the economic activities of all individual workers. Simultaneously, a welcome effort was begun to collect data on rural-urban migration, land tenures, housing and the key characteristics of all enterprises engaged in manufacturing activities. Despite manual tabulations, the 1961 Census produced more than 1400 volumes, some of which were published only after the next census was conducted in 1971.

The 1971 Census had initially aimed to continue the approach of the 1961 Census with some elaboration of the questions on migration and the questions on children ever born and surviving as well as birth during the year preceding enumeration (that had been tried out by William Brass in Africa). On the suggestion of scholars like the senior author of this piece, the Brass questions were pre-tested during the preparations for the 1971 Census and no difficulty was encountered in collecting the data. The Brass questions had the potential, under certain assumptions, to provide reasonably valid approximate estimates of the level of fertility as well as child mortality at the district and possibly the sub-district level. However, in 1969, a meeting of 'experts' in the Planning Commission suggested some change in the questions on economic activity, to separate out persons whose primary activity was work from others for whom work was a secondary activity or who worked in addition to some other primary activity. Also, a reputed British scholar, close to an influential senior bureaucrat in the Planning Commission persuaded the latter that the Brass questions need not be included in the census. He argued that the Sample Registration Scheme (started on a pilot basis in 1964 but extended to rural India in 1967 and urban areas in 1969), had the potential to provide all the information that the Brass question would provide. These views prevailed.

Subsequent caveats by Indian scholars against the modification of the economic questions and the dropping of Brass questions proved ineffective. The former change in the questions on economic activity proved most costly and led to gross underestimates of the number and proportion of female workers in the country. Those who designed the 1981 and 1991 censuses only

slightly modified the framework of the 1971 Census relating to the economic activities and sought to attain comparability with the earlier estimates instead of aiming at dependable or credible estimates of the number of workers and the worker-population ratios. The BRs were finally introduced in the 1981 Census; but a valuable opportunity of assessing the pre-transition demographic situation in different parts of the country was lost.

SRS DATA AND ORG SURVEYS

The Sample Registration Scheme (which later acquired the name of a system) was introduced because the estimates of birth and death rates based on the civil registration data understated the level of fertility and mortality. It is sometimes argued as though the SRS and the census data together provide all the information necessary for planning on the topics covered by them. It is overlooked that all such data need external validation and the best means to do so is to secure similar estimates through an alternative system. In fact, a basic strength of the Indian statistical system is the availability of alternative estimates for various indicators. The bureaucrats often dislike the debates and discussion arising from this situation; but they are a part of a healthy democratic system. On the number and proportion of workers, for example, the National Sample Survey has provided alternative estimates at the national and state level, by gender and rural-urban residence since 1972-73, which are substantially higher than those given by the census of 1971, 1981 and 1991. The so-called invisibility of the work participation by women of India is therefore a problem only for those who do not know about the NSS data or who do not know how the NSS data can be used to calibrate the census-based estimates. On vital rates, however, the NSS could not provide dependable estimates. The estimates of birth, death and infant mortality rates, obtained in the 1973-74 survey were so low, relative to the SRS rates, that they were not published. The data relating to the practice of family planning by the respondent households were, however, published partly because they were cross-tabulated by monthly per capita expenditure of the household, a variable on which no other source of information was available. The effort required to separate wheat from chaff often exceeds what the well-motivated members of the non-governmental organisations are able to make. Out of sheer exasperation, they blame the data collection agencies for not providing a 'single correct estimate', for example, of the

number of working females or the child labourers in the country. Little do they understand that given the widespread age-misreporting and the likelihood of a net undercount in the census, there is no single estimate even of the size of population, or the number of women, children, youth, or the aged in the country. (Demographers and statisticians have to smooth the data and the differences in the smoothing procedures adopted by different individuals lead to differences in these estimates.)

A major international demographic data collection effort during the 1960s and 1970s was the World Fertility Survey (WFS), supported by the US Agency for International Development (USAID). India did not participate in the WFS, partly because of its link with the USAID but also because it did not want to share its data with the sponsoring external agencies. However, the ministry of health and family planning (later family welfare) assigned to the Operations Research Group (a private sector market research firm at that time and now a large consulting organisation), a national survey on the level and correlates of use of family planning during 1970. A similar assignment was given to ORG in 1980 and 1989, mainly to check the estimates derived from the service statistics about sterilisations, the offtake or use of other contraceptives and the couple protection rates. The reports of ORG surveys were treated like most sensitive secret documents and were not easily accessible to non-officials or researchers. Subsequently, the 1970 survey data were placed in the data archives of the ICSSR for use by other scholars; but the data collected in the 1980 and 1989 surveys have simply been lost, partly because the ministries tend to be poor custodians of the survey data.

(During the early 1970s, the several 'area projects' undertaken in different states with external assistance had sponsored baseline surveys of the level of fertility, mortality and contraceptive prevalence in several states of the country. But the reports as well as the data remained confined to the MoHFW, the organisations conducting the surveys and the family planning/family welfare departments of the concerned states. As a result, the investments made in the surveys did not really yield the benefits that could have been reaped from the effort. In all probability, the poor institutional memory would ensure that no one would be able to lay hands on these reports. It was certainly not a creditable situation and it needed to be corrected.)

The level and method mix of contraceptive use reported by the ORG surveys

differed from the estimates based on service statistics. While the differences could be explained, a four-district survey in Gujarat in 1989 also indicated the need to improve the sampling procedures used by the ORG staff. It was also evident that an independent nationwide survey that could generate valid estimates for a large number of correlates of contraceptive use and maternal and health care at the state level, by rural-urban residence would be of great use. Neither the NSS nor the SRS staff had any comparative advantage in undertaking such a survey. Therefore, it was decided to launch the NFHS, with the field work entrusted to consulting organisations, in collaboration with the Population Research Centres, which had an extensive experience of district level surveys.

In any case, it would be a serious mistake to dismiss the value of a survey on the ground that its results conform to what was known earlier. The consistency between alternative sources of estimates enhances the credibility of estimates and the discrepancies point to the identification of areas where remedial intervention might be necessary. Likewise, it is wrong to condemn a survey because it did not collect data on difficult and highly subjective factors such as the quality of services. Many experienced friends describe such criticism as illustrating a 'heads I win, tails you lose' approach; and if any effort is made to collect some qualitative data, many a times the results are dismissed as soft, highly subjective and possibly misleading.

During the early 1980s, the WFS schedules were, in a sense, tested out in Maharashtra state, through the Population Research Centre located at the Gokhale Institute of Politics and Economics, Pune. (This issue includes a paper that draws on the Maharashtra survey.) Efforts to replicate the survey throughout the country through an USAID grant of upto 10 million dollars were caught in an unending ambivalence about the condition of open access to the data after the results were published. A part of the grant was to be used to strengthen the 17 Population Research Centres set up in different parts of the country with high expectations and ambitious objectives but poor resource support. The gradual openness of the late 1980s and the post-1991 climate of liberalisation helped to go ahead with the NFHS.

EXTERNAL ASSISTANCE

The NFHS is sometimes criticised on the basis of deep-rooted xenophobia. We do not see anything wrong in close association with the overseas experts, if they

make a useful contribution to help improve the methodology of data collection, processing or dissemination. The Indian experts, particularly statisticians and demographers, have often served as advisers to many other countries of the world. The tables are now turned; and the Indian statistical work is guided by the Special Data Dissemination Standards (SDDS) prescribed by the International Monetary Fund, to which India has subscribed (without adequate consultation with the professionals, according to a widely held view). A project on the modernisation of the statistical system of India with the support of the World Bank is under active consideration. It would probably enhance the timeliness of processing and dissemination of the data to a large extent and would prove a great gain for all those who use the data for policy formulation and discussion. The important thing is to ensure that the additional resources are used for worthwhile pursuits and not for relatively trivial activities, such as can be justified in the name of some United Nations' recommendation (which would in all probability be optional for developing countries, that face severe scarcity of resources).

The critical issue in such matters is the transparency and adequate debate among Indian scholars and policy-makers. There can always be legitimate complaints that some particular person(s), groups or institutions were not consulted; and the bureaucrats are certainly capable of creating a facade of consultation, while keeping key information close to their chest. Even the academics can feel threatened by (and therefore exclude) possible voices of dissent or those who would not easily be shut up. But this is our own Indian problem; we must not blame it on the expatriates (particularly the American/western scholars or the World Bank staff). The USAID and the World Bank necessarily work with the bureaucrats whose permission and collaboration are essential prerequisites of work in India. However, unlike a private sector survey agency that implements a contract from a ministry with a claim to be knowing all that needs to be known, the western tradition generally welcomes wide consultation and candid discussion among all stakeholders as the key to securing the best input from all sources, both official and non-official, and not missing out useful caveats about the things to avoid.

In fact, some complaints were made to the ministry of health and family welfare about the quality of field work in the NFHS. It led to a decision to resurvey a

sub-sample of the initial sample. With the National Sample Survey staff pre-occupied with their pre-designated workload, the resurvey work was assigned to the Indian Council of Medical Research. A resurvey has some inherent problems because it must allow for genuine change in the situation between the initial visit and the revisit. However, as has been reported in one of the papers in this issue, the NFHS came through with flying colours. There were also some baseless and unwarranted allegations as to how the NFHS reports were completed with an unusual speed after the end of field work. But they were generally ignored as illustrating the jealousies in a country with relatively limited opportunities. (The careful planning and the availability of good data processing equipment were the real contributory factors.) Also, the NFHS adopted an exemplary open approach to the dissemination of its reports and household level data and has encouraged considerable additional research. (Over the past two years, the NSS data have also become easily accessible to researchers, both Indian and foreign, under the data dissemination policy cleared by the cabinet.)

COST OF NFHS

It is a common refrain of many critics of the NFHS that it cost too much. It is conveniently overlooked that the survey was funded out of a grant that was intended to strengthen the Population Research Centres (PRCs), which had been starved of the requisite infrastructure (including adequate library support) for a long time. The NFHS indirectly provided these PRCs with some modest funds to undertake their regular activities without the usual stress. The per household cost of field work for the NFHS is widely regarded as very high; and on the ground of the ratchet effect, it is alleged to have raised the cost of all survey work to a new high. While there may be some truth in this charge, the high costs are partly a result also of the fact that rural field work is no longer as easy as it perhaps was in the past; and like all research, it no longer attracts committed souls. Also, the hidden costs of surveys conducted by governmental agencies (particularly the highly subsidised accommodation) are seldom assessed properly.

The cost of the NFHS was high, partly also because it insisted on the small teams of investigators (usually four women) being accompanied by a supervisor and an editor, who checked and edited the data on site. Few surveys in India have ever considered such a concern for quality. Also, most survey organisations had to hire jeeps,

which levy a fixed daily charge, irrespective of the distance actually covered during a day. There has been some talk in the Department of Statistics in recent months to adopt the same procedure for the NSS surveys; but it remains to be seen whether and how far the resources will become available to provide the exclusive transport facility to investigators and the accompanying supervisor.

QUALITY OF NFHS DATA

The papers included in this special issue demonstrate the use of both internal and external checks on the data. There are clear indications that the field work left something to be desired in the difficult states of Madhya Pradesh and Rajasthan; but overall, the NFHS has made a solid contribution to our understanding of the socio-demographic situation in India and its states as well as regions. The assessment about MP and Rajasthan is based on a comparison of the NFHS and the SRS data on the total fertility rates. However, one can debate whether the SRS itself secures a reasonably complete coverage of the vital events. As noted above, the comparative method can be an excellent aid for judicious and balanced assessments, provided that the analysts do not succumb to the temptation of claiming spectacular success in lowering fertility in such difficult states (by ignoring the contrary evidence)!

The NFHS data can be evaluated partly by comparing the rates and ratios reported by them with the census data as well. However, such comparisons must allow for the large number of inadequately trained enumerators, who have to be enlisted in the massive task of census-taking. If the sex ratios reported by a survey like the NFHS and the census differ, the discrepancy can be due also to the greater omission of females in the census and the NFHS need not be the culprit. (The 1991 Census seems to have faced serious problems in this respect in Bihar in particular and in regard to the older population almost throughout the country. However, identification of such problems requires arduous and patient exploration of the data without the glare of publicity that can be earned by sensational claims about aggravation of the deficit of women in the population.)

There are clear differences between the average size of a household reported by the NFHS and the 1991 Census or the various rounds of the NSS. The NFHS has reported a higher average household size than the 1991 Census in rural India but the reverse is true in estimates for urban India; the differences are offset and the

all-India estimates are very close. The quinquennial surveys of the NSS seem to report a lower household size than the census. However, these differences cannot be explained without considerable investment of time and effort. The availability of the household-level data to the analysts from the NFHS as well as the NSS will facilitate such additional work. However, the census authorities must now move with the times and make available to the researchers a copy of the tape of (at least a sample of) the census data. Simultaneously, the Indian social science researchers need to be given the resources to undertake intensive database research, with due attention to alternative data sets and their comparative analysis.

DECISION-MAKING FOR THE NFHS: AN INSIDE VIEW

Turning now to the papers included in this issue, Tara Kanitk, one of the coordinators of the NFHS, provides an excellent authentic overview of the key features of the NFHS, including its scope, coverage, the decision-making process and the role of expatriate consultants. As an insider looking back she would have preferred separate estimates for the slum and non-slum areas in metropolitan cities as well as regional estimates, an issue on which we have been fortunate to get a paper by Mari Bhat and Xavier.

The painstaking work of Mari Bhat and Xavier demonstrates the rich potential of the NFHS data for studying the differentials in demographic and socio-economic situation in 76 regions of the country. It compares the NFHS estimates with those based on the census on several characteristics; and demonstrates how the process of fertility decline has been evident throughout the country, including the demographically backward states. It also examines the regional estimates of child mortality, malnourishment among children, access to antenatal care, etc, and poverty measured in terms of the assets owned by the people. The paper attempts to identify the most backward region in each 'major' state and the five most backward regions of the country with respect to eight indicators of development. Enriched by geo-mapping of the variables, this paper is an excellent and more comprehensive sequel to the portrayal by late A.K. Mitra of the levels of regional development in India with the help of 1961 census data.

This special issue is privileged to include a paper on the results of a unique resurvey of a 5 per cent sub-sample of the NFHS, conducted during December 1993

and March 1994 in 13 more populous states of the country and Delhi. It is published with the encouragement of the former secretary, family welfare, who preferred transparency to secrecy about the results of the resurvey. The resurvey faced the expected non-response from about 5 per cent of the rural households and 25 per cent of the urban households because of out-migration (possibly temporary), or non-availability of any respondent, at the time of the revisit. The resurvey validated the total fertility rate reported by the NFHS except for Rajasthan, but found discrepancies in the estimates of immunisation levels in 10 of the 14 states. The resurvey found higher level of immunisation in five states of Uttar Pradesh, Madhya Pradesh, Rajasthan, West Bengal, and Bihar; whereas for the four states of Gujarat, Karnataka, Orissa and Haryana, the NFHS had reported a higher level of immunisation than the post survey check.

The post-independence censuses and surveys, conducted under government auspices have avoided collection of detailed data on the caste of an individual citizen, except for the statutory requirement to record the scheduled castes and tribes, for whom the Constitution had provided reserved seats in the parliament and in the services. The reservation for 'other backward castes' has been a burning issue in several states and the state-appointed commissions in Karnataka state have also conducted censuses of the castes and their characteristics. Yet, during the past year and a half, a suggestion to reintroduce a question on caste in the 2001 Census had led to a surprising debate in the newspapers and periodicals. Unwarranted assertions were made by reputed scholars that a question on caste would make it a caste-based census and that any such effort would lead to bloodshed and battles throughout the country. The empiricists, who have found no difficulties in recording the caste of respondent families in their rural field work, were baffled by the basic validity of this discussion. Of course, the tabulation and use of the caste data as well as the priority to be assigned to such tabulation were another matter.

An obvious answer to these questions seemed to be that these matters could be decided according to the felt needs of social scientists or the data users rather than any official agency such as the Office of the Registrar General and Census Commissioner. However, such options disappear and one is left speechless when one learns that under the Fukovian framework of discourse, all efforts at data col-

lection by the state are motivated by, or involve, or can be the instruments of the oppression of the people.

There is obviously a wide gap between economists or demographers (who have been involved in designing several national surveys over the years) and the guardians of people's rights who may not want the government to collect any data. However, the NFHS did collect data on caste; and at least in theory, the data are available for the 90,000 households to any one who may want to use them. Of course, the detailed caste codes are not a part of the normally distributed codebook, and special effort has to be made to get, understand and use them. Fortunately, K Srinivasan (who was the director of the International Institute of Population Sciences when the NFHS was planned) and Sanjay Kumar have demonstrated the fascinating potential of the caste data to assess and evaluate the impressions of association between caste and backwardness. Their most interesting paper covers the three states of Uttar Pradesh, Bihar, and Tamil Nadu, which together covered a population of 281 million (33 per cent of the total) in 1991. From the categories of scheduled castes and tribes, other backward castes and other castes, for the three states they first identified the castes for which the NFHS had surveyed at least 50 households. Next, for each of these castes, they have identified (a) the literacy rates among adults, and (b) the economic condition of the household in terms of (i) the quality of the house - kucha or pucca, (ii) access to electricity and toilet facility, (iii) possession of irrigated land, and (iv) possession by any household member of a watch, a radio, or a bicycle. The analysis suggests wide differentials between the castes in terms of literacy as well as poverty in all the three states. The authors come to the startling conclusion that despite the 75-year old history of reservations in Tamil Nadu, the inter-caste differentials in literacy and economic conditions had not disappeared. A most depressing finding indeed! As the authors themselves note, analysis of the type attempted by them was not an objective of the NFHS; but the availability of the household level data facilitates their ingenious use for various purposes. Presumably, we shall soon see a monograph by the authors on their most interesting use of the NFHS data.

The social science literature dealing with fertility decline and demographic transition has often focused on whether the poor shall inherit the earth because of differentials in fertility. Of course, the decline in fertility is also a consequence of

the people's aspirations for a better life for themselves and for their children; and the cause-effect linkage is not easy to establish. However, Roy, Jayachandran and Banerjee present an interesting analysis of the association in the four states of Punjab, Maharashtra, Kerala and Uttar Pradesh between fertility and the living standard of the household. The living standard is measured through an index that took account of the access to and/or ownership of certain amenities and livestock as well as durable goods. The variables included: type of house, availability of electricity, sources of drinking water, nature of toilet facility, and the possession of livestock and consumer durables. The negative relationship between the level of living and fertility appeared stronger among educated couples. Fertility measured in terms of births of different order per 1000 women did not differ much according to living standard among the less educated, except in Punjab. Also, the urge to adhere to the two-child norm did not diminish but childlessness declined with an increasing standard of living. The desired family size among the younger women declined with a rise in standard of living in Punjab, Maharashtra and Uttar Pradesh; but in Kerala, the state with the lowest fertility, relationship was not clear. Reported fertility declined with a rise in the standard of living in Punjab and Maharashtra. The unmet need for family planning was higher among households with a low level of living. As the family planning programme meets the unmet need for fertility regulation, the negative relationship between the level of living and fertility measures will weaken.

There has been widespread concern in India about the consequences of religious differentials in fertility for the composition of population, which can have serious political implications. The international experience (including that of Bangladesh) suggests that even the Muslim populations do not remain excluded from the process of demographic transition for long. K Moulasha and G Rama Rao analyse the responses of 69,570 Hindu and 10,070 Muslim women aged 13-49 and find that on an average, Muslim women had 1.1 children more than the Hindu women. The differential persisted within each level of education, with a higher TFR among Muslims than among the Hindus. Differentials in the number of children ever born and surviving indicates that Muslim women had given birth to 0.6 child more than their Hindu counterparts; but the extent of child loss was the same among both the groups.

The difference between the median age at first and the last birth or the estimated average reproductive life was 14 years for Muslims, three years longer than among Hindus. Despite the higher incidence of knowledge of at least one method of family planning among the Muslims, the level of current use of any method (particularly permanent methods) was considerably lower among Muslims than among Hindus. The use of a modern temporary method was, however, higher among Muslims than among Hindus in all educational categories. The data confirm that Muslims prefer modern temporary methods over sterilisations or abortions. The reported level of unmet need for contraception was also higher among Muslims than among the Hindus.

In India, data on marriage, use of contraception, duration of breast-feeding and the length of post-partum amenorrhoea and outcome of pregnancies have for the first time become available from one source – the NFHS conducted during 1992-93. Leela Visaria has used these data to estimate the 'proximate determinants of fertility' (in terms of the model evolved by John Bongaarts) for the 15 major states.

Bongaarts has empirically shown that the values of total fecundity rate (TF) range between 13 and 17 births per woman with an average near 15; and that values outside this range are very likely due to some data errors or estimation procedures. While the estimates of TF in nine states fall between 13 and 15, the TF values for four large North Indian states, Andhra Pradesh, and Orissa are lower than 11. (These low values remain to be confirmed by the second phase of the survey, but they suggest the possibility that several factors such as a relatively high secondary sterility, low coital frequency, and early terminal abstinence may be depressing the total fecundity rate in these states.)

The analysis based on the model suggests that use of contraception has made a sizeable contribution towards a transition from natural to controlled fertility in states such as Kerala, Punjab and Tamil Nadu. In Punjab and Kerala, this transition has been accompanied by a shorter duration of post-partum amenorrhoea, which enhances fertility. In Punjab, post-partum infecundability depresses the total fecundity rate by about two births, compared to more than four births in Gujarat, Maharashtra and West Bengal, where total fecundity rates are similar. In these latter states, there is considerable scope for a change in infant feeding practices and a resulting increase in fertility. It is essential, therefore, that reversible methods of contraception are promoted to compensate for the likely increase in post-partum infecundability.

An interesting hypothesis links the observed regional differences in the level of fertility with the deep-seated prevalence of son preference. The NFHS data on the subject, analysed by P M Kulkarni, confirm a broad regional diversity in the level of son preference. It is quite high in the north-central and eastern states (Rajasthan, Uttar Pradesh, Madhya Pradesh, Assam, West Bengal, Orissa, Bihar as well as in Punjab), moderate in the western-northern states (Karnataka, Himachal Pradesh, Haryana, Gujarat, Maharashtra) and low in the southern states (Kerala, Tamil Nadu, Andhra Pradesh as well as Goa and Delhi). Although parents value sons much more than daughters in all the states, the tendency is less strong in the southern region. The prevalence of consanguinity and the fact that a married woman maintains frequent contact with her natal home in the southern region [Dyson and Moore 1983] perhaps contributes to the relatively high value attached to daughters in the south.

WANTED RESIDENT DIRECTOR FOR PUNE

By well known Pune based Public Trust. The Trust is a nodal agency currently partnering NGO in nearly 80 Reproductive and Child Health Projects funded by the Government. Selected candidate should have outstanding track record, proven managerial ability and a commitment to develop the NGO sector to its full potential. Knowledge of Marathi will be an advantage. Age and Sex no bar. Attractive compensation package. Apply within fifteen days to:

Economic & Political Weekly, Box No. 0199,
Hitkari House, 284 Shahid Bhagat Singh Rd., Mumbai 400001.

than in the north.

Kulkarni estimates that in the absence of any son-preference, the percentage of couples of reproductive ages using a modern contraceptive would have been 41 per cent, 4.7 percentage points higher than the observed figure of 36.7 per cent. The contraceptive prevalence in the western-northern states, Gujarat, Himachal Pradesh, Haryana, Maharashtra, is severely depressed by 8-10 percentage points because of son preference; but the effect is minor (two to four points) in the southern states as well as in Delhi, Assam, Uttar Pradesh and Goa.

The elimination of son preference would reduce the TFR for India from 3.39 to 3.13, a decline of 8 per cent. For states like Himachal Pradesh, Maharashtra, Gujarat and Punjab, the decline would be large, over 15 per cent. The elimination of son preference would lower fertility in these four states to a level comparable to that in Tamil Nadu, Andhra Pradesh and accelerate the process of fertility transition. Unfortunately, the policy instruments to eliminate the deep-seated son preference from the Indian society are not easy to devise; but it is to be hoped that with the spread of literacy and education, the mass media can play an effective role in social transformation.

Until the 1950s, there were hardly any estimates of the actual age pattern of fertility in India. The population projections in the seminal work of Coale and Hoover published in 1958 had to use the fertility pattern suggested by the surveys conducted at the Gokhale Institute of Politics and Economics and the Ramanagaram Health Centre near Bangalore. These surveys conducted by the Gokhale Institute during pre-1970 period, merit a close look to identify the extent to which their estimates conform to those of the subsequent NSS and other state-level surveys. Such a comparison has been attempted by Sanjeevani Mulay, who concludes that the contribution of the observed increase in age marriage to the fertility decline has been offset by a fall in the incidence of widowhood. In fact, the sharp decline in mortality, especially adult mortality, has led to an increase in fertility.

In the post-1971 period, specially during 1971-77, fertility had declined mainly due to the strong push given to the family planning (sterilisation) programme during the emergency, which was followed by a backlash. However, women in younger age groups (below 35 years of age) had not lowered their fertility; in fact, their fertility had significantly increased. A sharp

decline in fertility was observed among women aged above 35.

Using the National Fertility and Mortality Surveys, 1980 and the NFHS, 1992-93, the author observes a decline of 24 per cent in the TFR in the entire state, 26 per cent in rural areas and 14 per cent in urban areas. The decline in TFR was much higher than in CBR. (This difference arises from the fact that TFR is estimated with equal weights assigned to different age groups, whereas the crude birth rates takes due account of the weights of different age groups in the population). Over the years, the Hindu-Muslim differentials have increased quite significantly. Among various regions, Marathwada region has lagged behind the other regions with respect to both the demand for family planning and the efficiency of provision of services.

The son preference is quite strong in Maharashtra. The proportion of sterilised couples with two children increased from 16.6 in 1980 to 37.4 in 1992-93; but among couples with two sons, the same percentage increased from 21.6 to 55.2 for the same period. The slow pace of decline in birth rate is due to an increase in fertility as well as son preference.

The NFHS was conducted before the emphasis of family planning programme shifted from targets for different methods of contraception to a more holistic concern with the reproductive health of the population at all ages and the health and survival of children. Given this shift in emphasis, Shireen J Jejeebhoy seeks to assess the contribution of NFHS to the information base on reproductive health in India and finds it to be quite limited. Of course, it has provided estimates of the level of contraception and methods used by age and parity and of unmet need for contraception. Also, it has expanded and systematised the knowledge about maternal mortality and health, access to ante-natal and delivery services, and complications at the time of delivery. Inadequate access to ante-natal care from a doctor or other health professional and the gaps in immunisation against tetanus and iron supplementation, and access to safe delivery have been identified. However, gaps persist with respect to morbidity in the ante-natal and post-natal periods; circumstances during pregnancy, childbirth and the post-partum period; and the content of ante-natal care received. The NFHS has also not addressed critical issues such as the extent to which women exercise choices in these matters without coercion; whether women actually obtain a method of choice and the constraints that the average woman

or man faces in seeking contraceptive and follow-up services.

The NFHS data on the incidence of induced abortions are gross underestimates and the awareness about the legality of abortions has not been ascertained. Likewise, infertility, a serious reproductive concern, with serious implications in terms of determinants and consequences, has been neglected in the NFHS. Another major gap in the NFHS has been its neglect of data on the quality of care in the area of maternal and child health.

CONCLUSION

To conclude, the second phase of the NFHS, that is now in progress and has been completed in several states, is likely to open up many opportunities for interesting analysis. Some non-official press reports have indicated sensational declines in the level of fertility in Bihar, Madhya Pradesh and Uttar Pradesh during the 1990s. Prima facie, wishful thinking rather than careful analysis forms the basis of these claims, which are not corroborated by the SRS data. There is no doubt that an irreversible process of fertility decline is in progress throughout the country; and that it has been faster in urban India than in rural areas. During 1998, the rate of natural increase in urban and rural India has reportedly dropped to about 1.4 and 1.8 per cent, respectively, with a national average of about 1.7 per cent. A replacement level of fertility may be reached in urban India within the next five years; but it is still a distant goal for the country as a whole. The recent indications (from the 1995-96 NSS survey of literacy and education) of an accelerated progress since the 1991 Census in literacy rates in rural areas, including the scheduled castes and tribes, inspire hope of a similar acceleration of the fertility decline, but it may partly be offset by the expected decline in mortality rates as well. Given the momentum for growth built into the young age distribution of the Indian population, the rate of population growth will drop below 1 per cent per year only during 2016-20. Also, unless the AIDS epidemic assumes unexpected alarming proportions, a zero rate of population growth is unlikely to be realised before 2055-60. Therefore, until we achieve complete registration of vital events throughout the country, surveys such as the NFHS will continue to be a valuable asset for understanding the demographic dynamics of Indian society.

Findings of National Family Health Survey

Regional Analysis

P N Mari Bhat
Francis Xavier

This paper attempts to show that the rich data on demographic, health and background characteristics of respondents and their households collected in the National Family Health Survey can profitably be analysed at the regional level. It checks the validity of estimates for a few variables derived for 76 natural regions from the survey data with similar estimates based on the 1991 Census. After ensuring consistency between these estimates, regional variations in many important socio-economic characteristics – for which the NFHS is at present the only source – are studied through maps generated from a GIS software. The spatial patterns that emerge from this analysis highlight the limitations of state-specific models of demographic change, and provide some interesting evidence on much debated nexus between poverty, malnutrition and disease. The paper concludes with a presentation of survey data on health and living conditions in the slums of Delhi.

ALTHOUGH the National Family Health Survey (NFHS) of 1992-93 was not the first nationwide demographic sample survey undertaken in India, it was unprecedented in at least four important respects.

First was its huge scale and coverage of topics; it canvassed about 90,000 households spread all over India, except Kashmir, Sikkim and a few small union territories. An equal number of ever-married women in the age group 13-49 were interviewed, and data in internationally comparable format were collected on topics such as marriage, fertility, family planning, child health, immunisation and nutrition.

The second distinguishing feature of the survey was its meticulous planning and execution. The survey questionnaires, sample design and tabulation plan were finalised after several meetings and workshops; a great deal of emphasis was placed on preparation of survey manuals, training of field personnel and supervision of fieldwork; data errors were minimised by deployment of a field editor in each team, and through computer-based consistency checks during data entry. Several international experts, well-acquainted with collecting similar data in varied social settings, provided technical input at every stage of the survey, from questionnaire design to report writing. Basically new standards were set on how to conduct a large sample survey and process the resulting information.

The third significant achievement of the survey was its quick and wide dissemination of the data. The preliminary reports of the survey were out within a year, and the final all-India report appeared within two years of the completion of the survey. Most significantly, for the first time, data from a demographic survey have been made available at the individual level to

researchers at India and abroad in a computer-readable format. This has made it possible to analyse the survey data in greater depth than what is available in the basic reports.

Finally, it ushered a new trend in survey research. It demonstrated that the experience and expertise available in various population research centres functioning under the ministry of health and family welfare, government of India, can be brought together and blended with the dynamism and efficiency of private marketing research organisations to carry out a nationwide survey, and produce a research output of high standard in a short span of time.

The survey sample of nearly one lakh households was designed to provide estimates for rural and urban areas of every major state in India. However, as the state-level data on many key indicators presented in the voluminous survey reports were already known from other sources, the survey results did not spring many surprises on policy-makers and administrators. The survey findings usefully confirmed the validity of the state-level data from sources such as the Sample Registration System on several parameters. However, policy-makers often plead for data at the district or, at least, regional levels, that are generally not available from other sources. This paper attempts to provide such regional estimates from the NFHS on parameters such as child mortality, total fertility, antenatal and natal care, child malnutrition and immunisation, contraceptive practice, poverty, exposure to mass media, home visits by health workers, and on many more.

Some theoretical considerations also justify a regional analysis of the NFHS data. The dearth of data for substate

administrative divisions has led to the propagation of demographic archetypes such as the 'Kerala model', 'Tamil Nadu model', 'Andhra model', 'Himachal model', etc., as and when a new state enters into the last phase of demographic transition. Such models take no account of the possible inter-regional disparities within the state or of similarities between neighbouring regions across states. Intentionally or otherwise, these archetypes exaggerate the role of the state in lowering the birth rate, and underplay the contribution of socio-cultural and historical factors. They also overlook the possibility of geographical space as a factor in diffusion of behavioural innovations. Only a greater understanding and appreciation of regional patterns in demographic change, that transcends political boundaries, can limit the increasing emphasis on state-specific models of change.

I Methodology

Regional divisions. The NFHS sample sizes are clearly inadequate for a district-level analysis. It is, however, possible to make analysis for groups of districts within a state. In doing so, a question naturally arises about the criteria to be used in delineating homogeneous clusters of districts. The vast Indian landscape, home to one of the world's most complex and plural polities, can be divided into regions and subregions according to several guiding principles. Of the many such prototypes available in the literature, at least three somewhat distinct schema seem relevant for our purpose, namely, (i) 'natural regions' based on geographical factors, (ii) agro-climatic and planning regions, and (iii) socio-cultural and linguistic divisions.

FIGURE 1: COMPARISON OF FEMALE LITERACY RATES FROM NFHS, 1992-93 AND FROM 1991 CENSUS

FIGURE 2: COMPARISON OF REGIONAL ESTIMATES OF PERCENTAGE OF MUSLIMS FROM NFHS, 1992-93 AND FROM 1991 CENSUS

The first approach of dividing the country into natural regions is evolved from the works of L Dudley Stann, J N L Baker, O H K Spate and others during the first half of this century. The emphasis in these attempts was on physiography, geological structure, climate and so on [e.g. Spate and Learmonth 1967]. Continuing in this tradition, in the post-independence period, several census monographs have proposed new methods for demarcating regional divisions in an attempt to revise and expand on the regions outlined in the earlier censuses. The latest and the most ambitious of such efforts was made as a part of the 1981 Census programme [Gol 1989]. In this exercise, the districts were classified as belonging to four macro-, 28 meso- and 101 micro-regions. The distinguishing feature of this effort was its attempt to classify villages and towns in each district of the country into submicro regions.

In the second approach, the aim has been to identify agricultural and economic regions for planning purposes. The emphasis here is on production specialisation and economic dependency as the basis for regional classification. One early attempt in this direction was the agrarian regions proposed by Dandl and Alice Thorner (1962). The Planning Commission has from time to time made attempts to delineate resource development divisions, backward areas and agro-climatic regions. The regions identified by the National Sample Survey Organisation (NSSO) are an outgrowth of such an exercise. Perhaps the most systematic of these attempts was that of Sen Gupta and Sdasyuk (1968) who first evaluated the natural and population resource bases, studied the agricultural and industrial regions, and proposed seven macro- and 42 meso-economic regions. Some later attempts have tried to achieve

the functional integration of regions by considering economic ties and commodity flows between places and areas [e.g. Mishra, Sundaram and Rao 1974].

In the last category of such schema, the purpose has been to identify regions of socio-cultural and linguistic similarities that had historically evolved out of socio-political interactions. The linguistic formula was, of course, given pre-eminence in the reorganisation of state boundaries in 1953, 1956 and 1960. An early attempt to identify the cultural zones of India was made by N K Bose. Subsequently, Rasheeduddin Khan (1973) had proposed 58 cultural subregions, that follow rather closely the scheme of natural regions proposed by late Asok Mitra in his 1961 Census report [Mitra 1965]. Recently, Ashish Bose (1994) has made some broad generalisations about demographic zones in the country. His attempt, however, does not go below the state-level.

Despite the different approaches to the demarcation of regions, they do not finally lead to very dissimilar propositions about regional taxonomy. This is not very surprising because the natural characteristics of a region have a profound bearing on agricultural and economic practices, which in turn have affected spatial interactions of inhabitants. Therefore, in the analysis of NFHS data, any convenient regional scheme can be chosen, as long as the regions defined are neither too large nor too small. A large region may not have

the desirable properties of homogeneity and functional integration while a small region may not have adequate representation in the NFHS sample.

NFHS sample by natural regions: The sampling design adopted in the NFHS constrains us to use the regional scheme employed in selecting the sample households for the survey. In the NFHS, rural sampling units in most states were selected using the 1981 Census list of villages while the urban blocks were selected in most states using the 1991 Census list. Prior to selection, villages, cities and towns of a state were first stratified according to the geographic criterion. In most states the geographic criterion used was the geophysical division as propounded in the 1981 Census study. In some states, however, alternate schemes such as the agro-climatic regions appear to have been followed (e.g. Maharashtra). Within each of these regions, villages were further stratified according to some socio-economic variables such as female literacy, distance to nearest town, village size, etc. The primary sampling units (PSUs) (villages and urban blocks) were then selected according to probability proportional to size. Since rural and urban PSUs of a state were selected independently, there is the danger of obtaining a skewed rural-urban break-up of sample households within a region if the criterion for re-grouping the PSUs is other than the one originally adopted for the sample selection.

TABLE 1. DISTRIBUTION OF REGIONAL DIVISIONS BY NUMBER OF SAMPLE HOUSEHOLDS AND EVER-MARRIED WOMEN IN 1992-93

Distribution Type	Size Class				Total Regions	Average Size
	<500	500-1000	1000-1500	1500+		
Households	3	34	27	12	76	1178
Ever-married women	2	35	24	14	76	1165

Keeping this in mind, it was decided to retain the geographic regions used in the selection of the sample. Although no separate codes were provided for the natural regions in the NFHS data files, it was possible to identify them from the district codes that were assigned as they were listed in the 1981 Census publications. An examination of the distribution of sample households by natural regions showed that some of them were too small to derive estimates with any confidence from the NFHS dataset. It was therefore decided to merge the regions with a sample of less than 500 ever-married women with a contiguous region with which they had the greatest similarity in levels of literacy. After such a rearrangement, a total of 76 regional divisions were formed. Table A1 of the Appendix shows the regions by name, districts falling within each region, and the number of sample households and ever-married women in the NFHS.

On an average, the NFHS covered 1,178 households and 1,165 ever-married women per region. About half of the identified regions have less than 1,000 sample households and ever-married women (Table 1). About one out of six regions have over 1,500 sample households. Out of the 76 regions, 46 per cent have 40 or more PSUs (villages or urban blocks) and 26 per cent have 30-40 PSUs and 21 per cent have 20-30 PSUs. The remaining 7 per cent have 16 to 20 PSUs. Although we do not propose to compute the standard errors for each estimate, a few general points can be made in support of the numbers we are dealing with at the regional level. As reported above, the NFHS sample sizes were originally fixed with the objective of deriving estimates for rural and urban areas of each state. The sample sizes assigned for urban areas in many states were in the range of 1,200 to 1,500, not far different from our regional samples. Moreover, the minimum sample size required for estimating different population parameters at the same level of confidence could vary quite a lot. For example, the sample size required for estimating contraceptive prevalence rate is much smaller than what is needed for estimating infant mortality rate. Even for the latter, using longer time period for computing the rate can bring down the required sample size. However, our regional-level estimates are generally based on a larger sample than that used for obtaining estimates for many social categories presented in the NFHS reports. The regional estimates discussed below could have been generated from the available NFHS data, but were somehow not a part of the tabulation plan.

Comparisons with 1991 Census: One way to validate the NFHS estimates for the regions is to compare them with estimates derived from alternative sources on some common variables. Only the population censuses provide data for geographical regions below the state. We have chosen two variables, female literacy rate and percentage of Muslims, for which both the NFHS and the 1991 Census data could be recast for the regional divisions. We have chosen these variables because the relevant census data are fairly reliable as seen by the consistent patterns of regional variation found in successive censuses. The percentage of Muslims was chosen in particular because it could exhibit greater sampling variability owing to their limited presence in many areas.

Figure 1 shows the scatter plot of the NFHS and the 1991 Census literacy rates for females. The basic data used in drawing this plot are shown in the Appendix Table A1. It should be noted that the census-based figures refer to women aged seven years and over, whereas the NFHS estimates are for ever-married women aged 13-49 years. Despite this difference, the consistency in the regional variation indicated by the estimates from the two sources is remarkable. The Pearsonian product-moment correlation between the two is as high as 0.973.

Figure 2 shows the scatter plot of the estimates of percentage Muslims from the two sources. It is again clear that the agreement between the two sources is quite high, and the correlation between the estimates from the two sources is 0.968. However, a few individual anomalies must be noted. In comparison with the 1991 Census figures, the NFHS estimates of percentage of Muslims are lower in Telangana (8 per cent against 15 per cent), and higher in southern Andhra coast (11 per cent against 6 per cent). The NFHS appears to have underestimated the Muslim population in Kerala, especially in northern Malabar and southern coast. In Jammu, the NFHS seems to have disproportionately missed out on Muslim households. The NFHS estimate of Muslims in Jammu is about 13 percentage points lower than the corresponding 1981 Census estimate. (No census was conducted in Jammu and Kashmir in 1991; hence the reference to the 1981 Census estimate.) Barring these few exceptions, the agreement between the two sources on the regional distribution of Muslim population is quite good. The root-mean-square deviation between the NFHS and census estimates of percentage Muslims turns out to be only 3 per cent.

At the national level, female literacy rate was about 40 per cent and the percentage of Muslims in the population was only 12. In both the cases the regional samples from the NFHS have performed well in distinguishing the regions with high values of these variables from those with low values. This is an important result as it raises one's confidence in the regional estimates presented below on many indicators for which NFHS is the only source available.

Another consistency check we did was with respect to rural-urban distribution of the population. Since rural and urban PSUs were selected independently, the sample distribution of urban-rural population in a region may not exactly correspond with that of the 1991 Census. The consistency check showed that the differences were marginal. The correlation between the percentage of sample ever-married women in urban areas of each region, and the percentage of urban population in the same region according to the 1991 Census, was 0.94. The root-mean-square deviation between the NFHS estimate and the census figure was less than 5 per cent. However, in five out of the 76 regions, the deviation was 10-15 per cent. Even in their cases, a re-weighting of rural and urban estimates would be of little consequence to the regional parameters discussed below.

In Table A3 of the Appendix, data on 36 indicators derived from the NFHS dataset are presented on which very little information was available thus far at the regional level. The definition of each variable and some qualifications are listed in Table A2 of the Appendix. The regional patterns suggested by some selected variables from this list would be discussed below with the aid of maps. For ease of exposition, we have classified the indicators into three groups: (i) demographic variables, (ii) proximate determinants and policy variables, and (iii) socio-economic variables, and each group will be discussed separately.

The maps have been drawn using a Geographical Information System (GIS) software package called POPMAP, developed by the UN Statistical Division. The boundaries of regions and the political divisions shown in the map are only indicative, and are not drawn strictly to scale. Except in a few cases the class-interval used in the maps for each variable represents equal number of cases (i.e., 15 regions). Thus the lowest class interval has bottom 20 per cent of the regions and the highest class-interval contains the top 20 per cent of the regions. Higher class-intervals are shown with darker shades

FIGURE 3: AVERAGE NUMBER OF CHILDREN EVER-BORN TO WOMEN OF AGES 40-49 YEARS IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

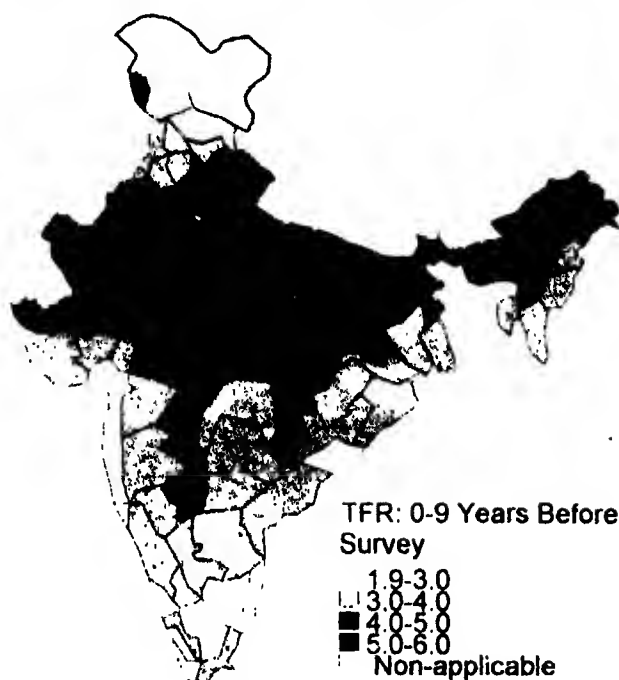

FIGURE 4: LEVELS OF TOTAL FERTILITY RATE DURING 0-9 YEAR PERIOD PRECEDING THE SURVEY IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

and lower ones with lighter shades. Since Kashmir and Sikkim were not covered in the NFHS, their area are left blank in the maps.

Demographic Variables

In this section we shall discuss the spatial patterns of two key demographic processes, fertility and mortality. On fertility, we have selected two indicators from the NFHS data set, ie mean number of children ever born to women aged 40-49 years in 1992-93, and total fertility rate (TFR) computed from the births that had occurred to women in the 10 years preceding the interview. The first measure gives the actual completed family size (CFS) of women who were born in the 1940s and had their major part of the child-bearing period in the 1970s. The second measure shows the expected completed family size according to the age-specific fertility rates of the 1980s. The cohort measure could be subject to considerable sampling variability as it is based only on women of ages 40-49 years at the time of the survey, who on an average, numbered about 200 in a region. In the case of TFR, we have taken the exposure period of 10 years (instead of the three years used in the NFHS state-level estimates) to reduce the influence of sampling errors. Also, taking a 10-year interval may have reduced the influence of errors suspected to be present in the reported dates

of birth of children [Bhat 1995; Narasimhan et al 1997].

It is useful to assign a time period to the estimates of cohort fertility in order to compare them with the estimates of TFR to get an idea on the time trend. A simple method is to assume that all the births of the cohort occurred at the mean age at childbearing, which was around 28 years in the 1970s. Thus the completed family size of the cohort aged 40-49 in 1992-93 could be reflecting the total fertility rate of the period 1975-76. The TFR estimated from the births to women in the period 0-9 years preceding the survey can be directly assigned to the year 1987-88. The accuracy of these date assignments for the two measures from the NFHS can be cross-checked against the annual estimates of TFR from the Sample Registration System. At the national level this source registered a TFR of 4.9 in 1975

and 4.0 in 1988. These figures are almost identical to the CFS and TFR estimates from the NFHS (4.84 and 3.98, respectively). Thus the comparison of the CFS and TFR estimates from the NFHS can give us a fairly accurate picture of the regional patterns of fertility change during the 12-13 year period, from 1975-76 to 1987-88.

The estimates of CFS show that among the 76 regions, none had a total fertility under 3 births per woman around 1975; 12 were in the range 3-4, 35 in the range 4-5 and the remaining 29 regions were above five (Table 2). The estimates of period TFR show that around 1987 there were 13 regions with total fertility under three; 45 between 3 and 4, 32 between 4-5 and only eight regions were above five. In effect, after the lapse of 12-13 years since 1975-76, only 30 per cent of the regions had remained in the same total fertility class in which they were in the

FIGURE 6: COMPARISON OF REGIONAL ESTIMATES OF TOTAL FERTILITY RATE FROM THE NFHS, 1992-93 WITH THOSE FROM 1991 CENSUS

mid-1970s. In absolute terms, on an average, total fertility had dropped by 0.9 births per woman, in every class interval of total fertility. In percentage terms however, regions with lower fertility levels in the mid-1970s, had experienced larger reductions in the subsequent 12-13 year period (Table 2). In an earlier analysis using the district-level census data, evidence was found of stagnation in fertility decline in areas with a medium level TFR [Bhat 1996]. The regional estimates presented here from the NFHS fail to corroborate

that finding. However, the NFHS estimates confirm the earlier finding that there had been substantial reductions in fertility throughout the length and breadth of the country, not just in a few pockets here and there. In all the 76 regions, the TFR estimate for 1987-88 was lower than the cohort fertility (i.e., CFS) estimate for the mid-1970s.

Figures 3 and 4 show the regional maps of completed family size and period total fertility. To enhance comparability, we have used identical graphical patterns for the same class intervals in the two figures.

FIGURE 7: ESTIMATED LEVELS OF UNDER-5 MORTALITY RATE (Q_5) IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

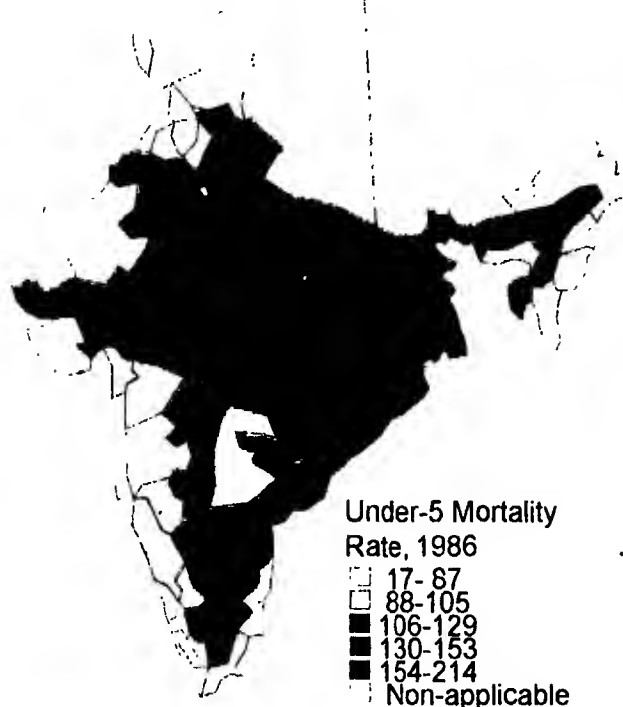

FIGURE 8: COMPARISON OF REGIONAL ESTIMATES OF UNDER-5 MORTALITY RATE (Q_5) FROM THE NFHS, 1992-93 WITH THOSE FROM THE 1991 CENSUS

Figure 3 shows that around 1975, the total fertility was above five in entire Assam and Bihar, northern Bengal, Uttar Pradesh with the exception of Kumaon region, northern and eastern Madhya Pradesh and parts of Haryana and Rajasthan. All these regions are geographically contiguous. On the other hand, total fertility was under four in some pockets, in almost entire Kerala, Kongunad of Tamil Nadu, Konkan and Western Ghat regions of Maharashtra (Desh), and in coastal Andhra Pradesh. As Figure 4 shows, by the late 1980s, the area

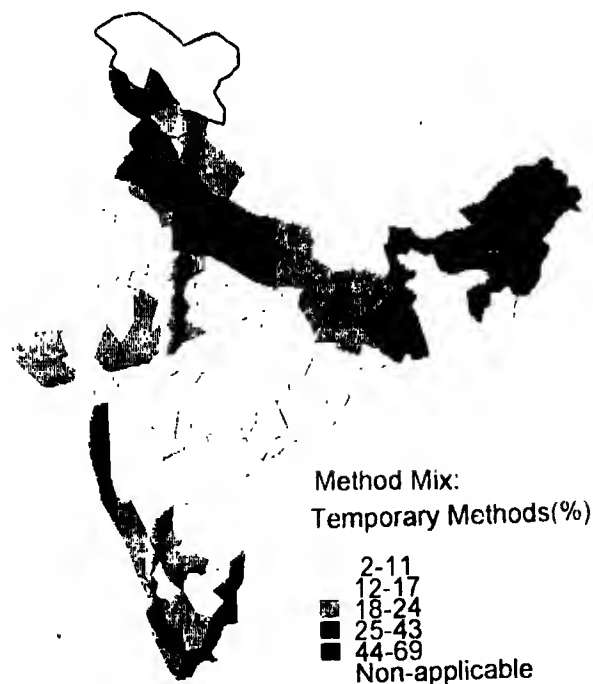

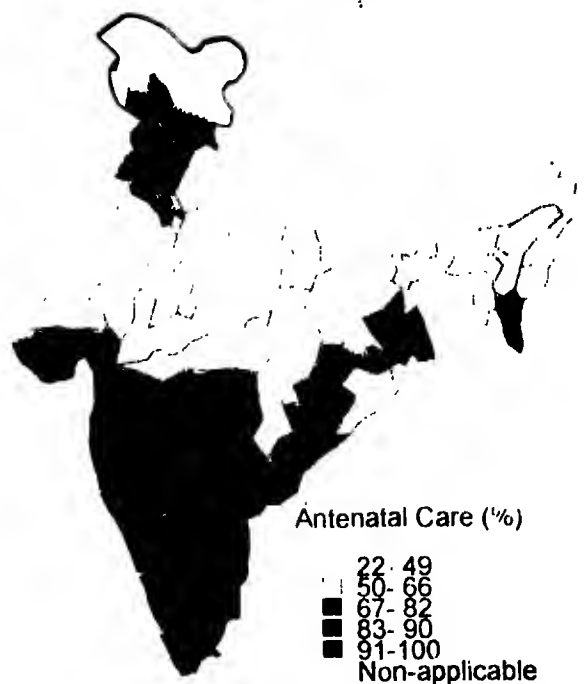

FIGURE 12: PERCENTAGE OF WOMEN RECEIVING ANTENATAL CARE DURING PREGNANCY IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

with high fertility (i.e., TFR above five) had shrunk considerably in size. It covered only north Bihar plain (Maithila/Tirhut region), Uttar Pradesh excluding Kumaon and Chambal plains of Madhya Pradesh (Malwa north). In the entire south, excluding the semi-arid regions of Deccan pla-

teau, total fertility had dropped below 4 by 1987; and in most parts of Kerala, Tamil Nadu and in Konkan coast, TFR was below 3. The total fertility had fallen below 4 in a few regions of northern and eastern India too. In the north, these were adjoining regions of Punjab, Haryana,

Himachal Pradesh and Jammu. In the east, they were Orissa, southern Bengal and southern states in the north-eastern India.

Figure 5 shows the decline in total fertility implied by the comparison of CFS with TFR. The class intervals used in the map are according to the percentile dis-

FIGURE 13: PERCENTAGE OF BIRTHS ASSISTED BY TRAINED HEALTH PROFESSIONALS IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

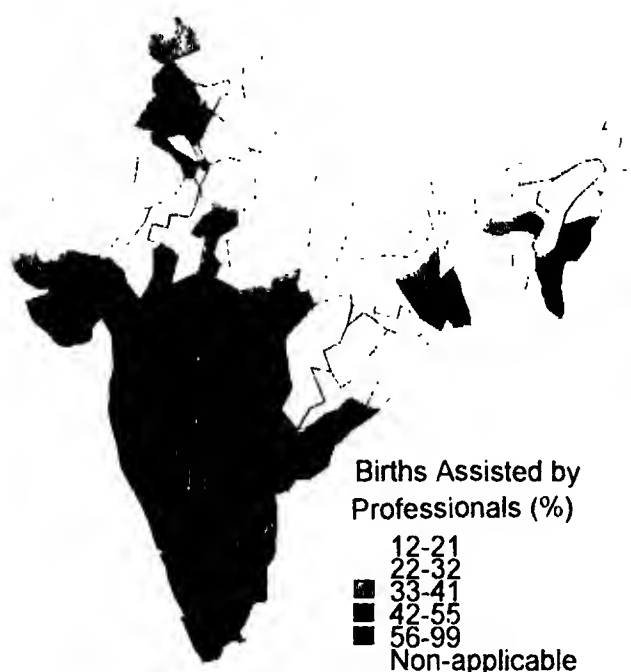

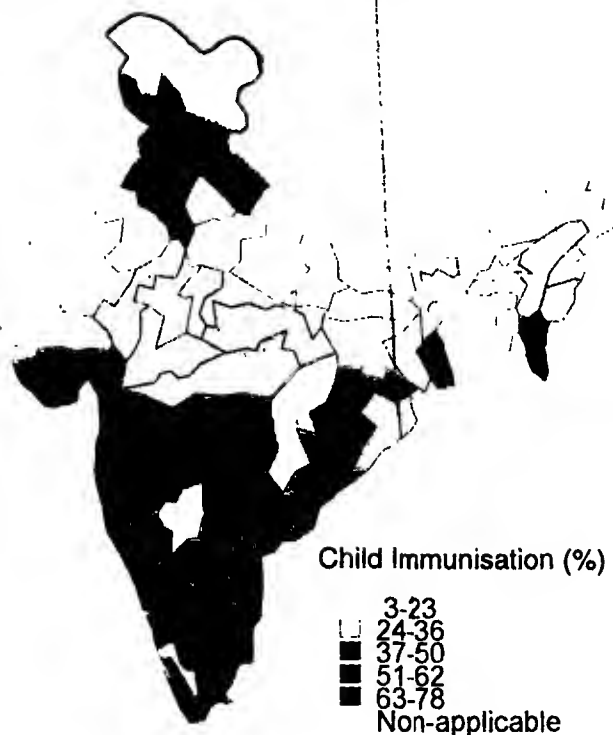

FIGURE 14: PERCENTAGE OF FULLY-IMMUNISED CHILDREN OF AGE 12-23 MONTHS IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

tribution of regions. In the 76 regions, the implied drop in total fertility varied from 0.1 birth per woman in southern uplands of Uttar Pradesh (Bundelkhand region) to 1.8 births in south Malabar and western hill region of Kerala. It was earlier observed that the magnitude of decline was not a function of the level of CFS. Figure 5 however shows that there was some regional variation in absolute quantum of declines in fertility. Most regions of Kerala, Tamil Nadu and Karnataka had a decline of more than 1 birth per woman, roughly during the period 1975-87. Assam, Saurashtra region of Gujarat, Jammu and a few other pockets appear to have had a fall in fertility of similar magnitude. But in most parts of Rajasthan, Madhya Pradesh, Uttar Pradesh and Bihar, fertility had declined by less than 1 birth per woman. Thus fertility decline appears to be driven by some region-specific factors rather than simply by the level of fertility.

How reliable are these findings? Fortunately, an alternate source is available to check the reliability of regional patterns of fertility thrown up by the NFHS estimates. It is possible to estimate total fertility from the 1991 Census data through several methods at the district level. They can be pooled to provide estimates at the regional level. As a part of another project, we have made estimates of TFR at the district level using the birth-order data of the 1991 Census. These have been recast to produce re-

gional estimates and are shown in Appendix Table A3. The census-based estimates refer to the year 1990 and they can usefully be compared with the TFR estimate from the NFHS, roughly for the period 1987-88.

Although the estimates of TFR from the two sources refer to slightly different time periods, at the all-India level, the two estimates are identical at 4.0 births per woman. In assuming that fertility levels were falling during this period, the comparison suggests that the estimate of TFR from the NFHS for all-India had a slight

downward bias. In Figure 6 we have plotted the census-based estimates for 1990 against the NFHS-based estimates for 1987-88. The consistency between the estimates from the two sources appears to be quite good, except for a few conspicuous outliers. All of the outlying regions are from north-eastern India for which the TFR estimates from the NFHS are substantially lower than the census-based estimates, some of them by as much as 2 births per woman. Specifically these regions are Nagaland, Mizoram, Meghalaya, Manipur

TABLE 3. PERCENTAGE OF HOUSEHOLDS HAVING VARIOUS ASSETS AND WEIGHT GIVEN TO EACH ASSET IN DERIVING A COMPOSITE INDEX, NFHS 1992-93, ALL-INDIA

FIGURE 15: PERCENTAGE OF CHILDREN OF 1-47 MONTHS WHO WERE UNDERWEIGHT FOR THEIR AGE IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

and north-western region (Assam valley). Although both the sources could be in error, we are inclined to suspect the accuracy of the NFHS estimates in these cases as there are reasons to believe that NFHS data collection work in these regions had suffered on account of the lack of familiarity of fieldworkers with the terrain. The overall correlation between the estimates from the two sources is 0.80. However if the estimates for the north-eastern regions are excluded, the correlation rises to 0.92. This is a remarkable level of consistency, given the approximate nature of the birth-order-based estimates of TFR, poor quality of census data on fertility, and the sampling errors in the NFHS-based estimates.

We turn our attention now to the estimates of mortality. Although the NFHS had included a question on deaths in the household during the two years preceding the survey, the data could be severely affected by sampling and non-sampling errors. Even the state-level estimates of crude death rate carry a relative sampling error of about 5 percent. However, child mortality estimates (including infant mortality) derived from the responses to questions put to women on their fertility and surviving children are subject to less severe forms of errors. Hence we shall confine our discussion to estimates of child mortality.

There are two alternate approaches for estimating child mortality from the NFHS data. Using the information on dates of birth of children from woman's birth-history data, the probabilities of survival from birth to various childhood ages can be estimated. Alternatively, estimates of child mortality can be made using the

FIGURE 16: COMPARISON OF REGIONAL ESTIMATES OF UNDER-5 MORTALITY RATE (q_5) WITH PERCENTAGE OF UNDERWEIGHT CHILDREN OF AGE 1-47 MONTHS, NFHS, 1992-93

'Brass-method' from the data on children ever born and children surviving among women of various ages. In this indirect method, the birth history information is not used, but the trajectory of births in the years preceding the survey is approximated from the distribution of children ever-born to women of different age groups. The first method gives the exact estimate if the input data are free of errors. The second makes less demand on the data, but gives only approximate levels.

In the NFHS reports, estimates derived from the former method are presented. However, application of the second method to all-India data has shown that it provides higher estimates of child mortality that are closer to the SRS estimates [Bhat 1998]. It may be noted that the direct method would underestimate child mortality if the reported ages of children are higher than their true age (i.e., occurrence of birth is displaced backward in time). Since there is evidence suggesting that such errors were present in the NFHS birth history data [Bhat 1995], we have used the second method for making regional estimates of child mortality.

In Table A3 of the Appendix we have presented the 'graduated' estimates of under-5 mortality rate (q_5) for the 76 regions. Graduation is the process of smoothing or averaging estimates derived for different ages with the help of a model or a mathematical function. Generally, estimates of under-5 mortality are not recommended for use without graduation because they are based only on the responses of women aged 30-34 years at the time of interview. Our estimates of q_5

were derived after graduating the child mortality estimates (q_2 , q_3 , q_5 and q_{10}) derived from the responses of women aged 20-39 years at the time of the survey. Another point to be noted is that child mortality estimates derived from the survey do not refer to the survey year, but to a period that depends on the age intervals of women used in their computation. The q_5 estimates presented here refer approximately to a time period six years before the survey, or roughly to the year 1986-87.

For India as a whole, the estimated level of under 5 mortality was 137 per 1,000 births in 1986-87. In the 76 regions its level varied from 214 in north-western uplands of Madhya Pradesh (Chambal ravines) to 17 in Nagaland. The lower limit of the range was probably an underestimate; the next lowest figure was 31 in central coast of Kerala. Figure 7 gives the map showing the regional variation in child mortality. The five class intervals used in the map have equal number of cases. The top 40 per cent of the regions where under-5 mortality exceeded 130 per 1,000 births in the late 1980s, were in Assam, Orissa, Madhya Pradesh, Uttar Pradesh (excluding the Uttarakhand region), north Bihar, eastern Rajasthan, northern parts of Gujarat and West Bengal. In much of Uttar Pradesh, Madhya Pradesh and Orissa, the under-5 mortality was over 150 per 1,000. Regions in south India where child mortality exceeded 130 births per woman were in Hyderabad-Karnataka region, Rayalaseema, and Baramahal region (eastern uplands) of Tamil Nadu. On the other hand, the bottom 40 per cent of the regions where q_5 was under 90 per thousand were either in west coast of India,

adjoining Ghat sections, or in north-western plains and Himalayan region, or in north-eastern India. However, among these, quality of NFHS data for the north-eastern regions appears suspect.

In the case of child mortality too, the 1991 Census provides some data for checking the dependability of the NFHS estimates. The indirect estimates of child mortality from the 1991 Census have been computed at the district level by the census organisation and other researchers [India, Registrar General 1997; Rajan and Mohanaachandran 1998]. We have also independently generated similar estimates from the census data, with only minor changes in estimation methodology. In particular, we have graduated the child mortality estimates (q_2 and q_3) computed from the responses of women aged 20-29 years at the time of the census. Data for older women were not used, as they appear to suffer from serious recall errors. The estimates of under-5 mortality so derived can be aggregated to provide estimates at the regional level. These have been shown in the Appendix Table A3. The census-based estimates refer to a time period just one year later than the NFHS-based estimates (i.e., 1987-88).

Figure 8 shows the scatter plot of the estimated of child mortality derived from the two sources for the 76 regions. Although there is a positive association between the two sets of estimates, the correspondence between the two is not very satisfactory. For most regions, the NFHS-based estimates of child mortality are significantly higher than the census-based estimates. At the national level, the estimated under-five mortality rate is 137 per 1,000 from the NFHS whereas it is 97 from the 1991 Census, though both refer to approximately the same time period. Such a large discrepancy could not have occurred from the sampling errors in the NFHS. Further, as reported earlier, the NFHS estimate is close to SRS estimate for the same time period. Therefore the only conclusion that can be derived is the poor quality of the 1991 Census data on child mortality.

There are, however, a few regions for which the NFHS data imply lower child mortality than the census. These regions are the following: north Malabar and south coast of Kerala, the desert region of Rajasthan, Nagaland, Meghalaya and Mizoram states of north-east India. Among these, child mortality estimates from the NFHS are unbelievably low for the extremely arid region of Rajasthan and for the north-eastern states. They could be a result of the problems in data collection in these difficult regions. Owing to some

recent media attention to the topic, a brief comment may be in order on the low figures found in two regions of Kerala.

Although in the two regions of Kerala the census-based estimates are higher than the NFHS estimates, for the state as a whole, the two sources suggest very similar levels of under-5 mortality rate (47 and 45 per 1,000, respectively). This is because in south Malabar and Hill districts, NFHS estimate is higher than the census-based estimates. In comparison, the under-five mortality rate for the state implied by the SRS child death rates for the same period was lower by about 20-25 per cent (36 per 1,000). However, much larger difference is seen in the estimates of infant mortality, if the census-based child mortality estimate is converted into an estimate of infant mortality, using a 'model' life table. This is because infant mortality estimates derived from indirect methods are sensitive to the assumption regarding the age patterns of mortality within the childhood ages. The estimates of under-

5 mortality are less sensitive to this assumption. Hence they should be used rather than the infant mortality whenever the comparison involves estimates based on indirect methods.

Returning to the subject of regional variations at the national level, the problem is not simply that estimates from one source are considerably lower than the other. There is considerable disagreement on the spatial variation in child mortality levels. The overall correlation between the estimates from the two sources is only 0.70. In our judgment, the major part of the blame for the relatively poor consistency should go to the poor quality of the census data on child mortality. Even in the case of Kerala just discussed, the NFHS appears to provide a more reasonable spatial pattern of child mortality variation than the census, even though the former was subject to greater sampling variability. The strong geographical clustering of regions of high and low levels of child mortality that is seen in Figure 7 could not

FIGURE 17: PERCENTAGE OF WOMEN IN RURAL AREAS WHO WERE VISITED AT HOME BY A HEALTH WORKER EITHER FOR ANTENATAL CARE, OR FOR FAMILY PLANNING FOLLOW-UP SERVICE. 76 REGIONAL DIVISIONS, NFHS, 1992-93

FIGURE 18: PERCENTAGE OF WOMEN REGULARLY EXPOSED TO ANY MASS MEDIA IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

have arisen if the NFHS estimates were subject to large sampling errors. The regional estimates of malnutrition among children, discussed later in this paper, show stronger correlation with NFHS-based estimates of child mortality (0.71), than with the census-based estimates (0.47). Therefore, barring a few instances already mentioned, the regional estimates of child mortality based on the NFHS seem more dependable.

III Proximate Determinants and Programmatic Variables

The proximate determinants are the intervening (or intermediate) variables that the socio-economic and policy variables must influence in order to lower the fertility and mortality levels. From the NFHS data set we have extracted data for three proximate determinants, namely, age at first marriage of women, separation of spouses, and knowledge and use of contraceptive methods. The NFHS also provides data on two other important proximate determinants, breastfeeding and induced abortion. The examination of state-level information on breastfeeding duration suggests that it is not prone to a great deal of regional variation, hence it is not considered here. The data on induced abortions are of suspect quality, and would be subject to large sampling variability if estimated at the regional level. Hence, the

variable was dropped from the analysis.

On proximate determinants of child mortality, we have considered the extent of antenatal care of pregnant women, place of delivery and person attending the delivery, child immunisation and nutritional levels of children. Besides these, we have also extracted data for a few policy variables, such as the extent of home visits made by the health workers and reach of family planning messages through electronic media. The proximate determinants of fertility are first taken up for discussion.

Proximate determinants of fertility: The NFHS has collected direct information on age at first marriage of ever-married women and their husbands from which the mean or median ages at marriage can be computed for various time periods or cohorts. Alternatively, the estimates of 'singulate' mean age at first marriage (SMAM) can be computed indirectly from the age-sex-marital status of the population. Since estimates from the indirect method are likely to be less prone to sampling fluctuations, we have followed the second method.

The mean age at marriage of females was about 19 years at the all-India level. In the 76 regions, the level of SMAM varied from 16 years in the north-eastern uplands of Madhya Pradesh (Bundelkhand/Baghelkhand region) to 25 years in Goa. Figure 9 shows the map of the regional estimates of SMAMs for females. The regional contrasts are striking. The mean

age marriage of females is over 21 years on entire west coast of India, Saurashtra, and in parts of Punjab, Himachal Pradesh, Jammu, Assam, Manipur and Tripura. On the other hand the mean age at marriage is lower than the legal minimum of 18 years in the whole of Rajasthan, Madhya Pradesh, north Bihar and in central Deccan plateau, covering parts of Maharashtra, Karnataka and Andhra Pradesh. It is interesting to note that spatial variations do not respect any state boundaries; nor can the differences be characterised simply as a disparity between the north and the south.

In Table A3 we also have provided data on the proportion of currently married women among all women in the age interval 15-49 years, by region. They show very similar spatial patterns of variation as the SMAMs. Hence they are not discussed here.

Separation of spouses is another proximate determinant that affects fertility. Although the data on it were collected in the NFHS, they were not discussed in the survey reports. Table A3 of the Appendix gives data on currently married women of ages 15-49 years whose husbands were living elsewhere at the time of the survey. It should be noted the NFHS had also covered women who were visitors to the sample households to compensate for the usual residents who had gone elsewhere temporarily. The inclusion of visiting women would overstate the extent of separation of spouses that result from labour

CRISES, REFORMS AND RECOVERY

Experience and Outlook for 2000-2010

An invitation conference

At SCOPE Convention Centre, SCOPE Complex, Lodi Road, New Delhi (India)

3-5 January 2000

Jointly organised by

Faculty of Management Studies, University of Delhi

Indian Industrial Relations Association

International Management Institute

Standing Conference of Public Enterprises

Economies, industries and enterprises all over the world have experienced excessive turbulence recently in their fortunes. Socialist command economies collapsed. Failure of even the miracle market-economies of East Asia and others brought global shock waves all over. Prosperous and stable economies of West Europe experienced high incidence of unemployment. Their social security system came under severe strains. The question that is being asked is: Is social disintegration the price of economic integration?

Financial institutions and capital market demonstrated their malfunctioning. Labour markets faced turbulence. Unemployment, downsizing, deskilling, delayering and performance-linked compensation emerged as familiar recipes of reform. Is labour becoming a redundant resource in the process of globalisation, liberalisation and privatisation?

Technological aids became necessary for competitive efficiency. But the social fall out demanded pointed attention. Can technological change be without tears?

Search for transparency, accountability and better results led to capital reforms and industry specific reforms. Regulatory authorities have emerged in different forms and shapes. Better corporate governance became urgent necessity. Restructuring, mergers and acquisitions, strategic alliances, sickness and closures followed all over. What has been the balance of experiences in issues in this regard? How does one cope with the resultant inequity in the distribution of pains and gains? What are the prospects for a better and brighter future in terms of competitive efficiency, employment effects, and social equity?

The conference would focus on the following areas:

- Policies of financial institutions – international and national – and their impact
- Capital markets and financial institution reforms
- Technology and market led changes in product and labour markets and industry structures
- Enterprise reforms, restructuring and corporate governance
- Skills renewal and social safety nets
- Public sector and public systems reforms – Efficiency and equity issues in disinvestment
- Deregulation and reregulation – Inefficient utilities vs. insufficient regulation

The conference will review and analyse the trends and explore alternative ways to coping up with the emerging challenges.

INVITATION FOR CONTRIBUTING PAPERS

Papers providing comparative analysis of trends in selected sectors with country, industry and enterprise focus are welcome.

Please send suggestions on the theme/sub-themes and proposals for papers. Conference papers on any sub-themes can be sent in word97 format through email along with a hard copy and diskette by separate post latest by **10 December 1999**. It is proposed to publish the conference proceedings in one or more volumes after the conference.

Local hospitality would be provided, on prior information and confirmation, to international resource persons and invited local (Indian) resource persons contributing papers.

Address for correspondence:

FIGURE 19: COMPARISON OF REGIONAL ESTIMATES OF POVERTY AND WEALTH STATUS MEASURES BASED ON HOUSEHOLD ASSETS, NFHS, 1992-93

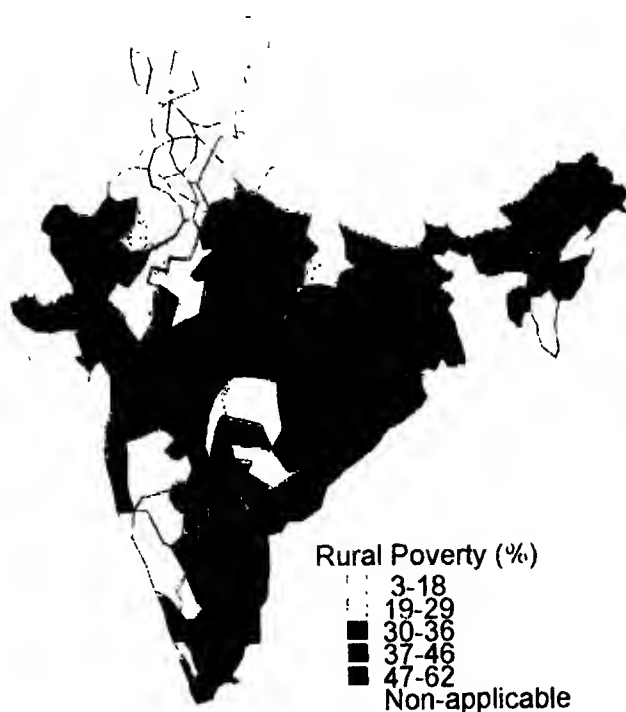

FIGURE 20: PERCENTAGE OF RURAL HOUSEHOLDS WITH AN ASSET INDEX SCORE OF UNDER 5 IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

migration or delayed cohabitation. Therefore we have computed this indicator after eliminating visitors from the sample.

Generally, the percentage of currently married women who were living away from their husbands was less than five. However, a few regions recorded substantially higher percentages of spousal separation. They were Himachal Pradesh (25), Jammu (17), Uttarakhand (22), eastern Uttar Pradesh (21), north Bihar plain (14), south Bihar plain (11 per cent) and Kerala (15). These are known to be regions from where young men go out in search of employment, or join the army, leaving behind their wives

and children. What may however come as a surprise is the extent of separation of spouses suggested by these figures.

Perhaps the most important proximate determinant of fertility is the level of contraceptive use. In India as whole, 41 per cent of currently married women in the age interval 15-49 (or their husbands) were using a method of contraception at the time of the survey. In the 76 regions, the contraceptive prevalence rate varied from 13 per cent in Nagaland to 73 per cent in the central Kerala coast. Figure 10 shows a map of regional estimates of contraceptive prevalence rate derived from

FIGURE 21: COMPARISON OF REGIONAL ESTIMATES OF RURAL POVERTY BASED ON ASSET HOLDINGS WITH PERCENTAGE OF UNDERWEIGHT CHILDREN OF 1-47 MONTHS, NFHS, 1992-93

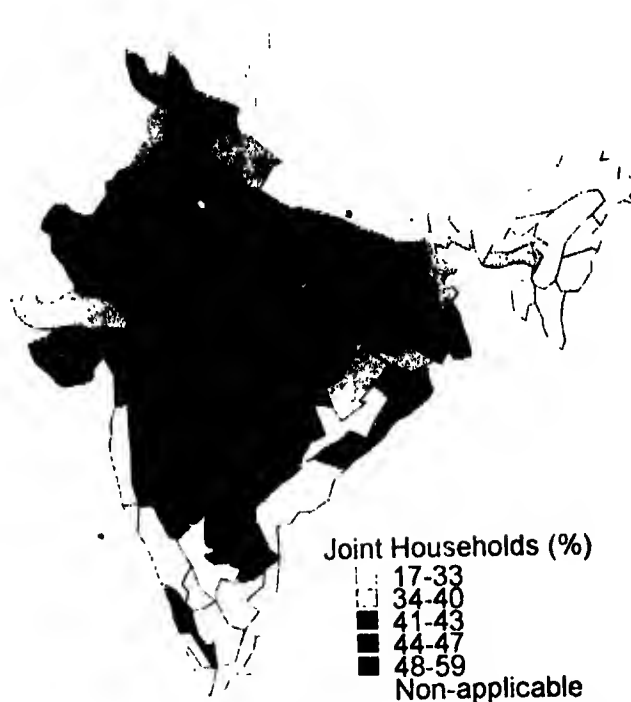

FIGURE 22: PERCENTAGE OF JOINT HOUSEHOLDS IN 76 REGIONAL DIVISIONS, NFHS, 1992-93

the NFHS data. The regional contrast bears some resemblance to the spatial variation in age at marriage of females. Regions with high contraceptive prevalence rates (over 50 per cent) form four distinct blocks: the whole of west coast of India, adjoining hilly tracts, and Saurashtra form one block. The coastal regions of Andhra Pradesh and Tamil Nadu form another block, but much narrower than the one on the west coast. The north-western region comprising of Punjab, Himachal, east Jammu and Haryana form the third block. The fourth block is made up of West Bengal, Tripura and Mizoram, separated by Bangladesh.

The regions of low contraceptive prevalence cover a very vast area. The bottom 20 per cent of the regions, where less than one-third of the women were practising contraception, were in Bihar, Uttar Pradesh (excluding the Kumaon region), and Madhya Pradesh, north of Narmada valley. Outside this mega-region, low contraceptive levels were found in the Rajasthan desert, Tel-Mahanadi region of Orissa and in northern states of north-eastern India (Arunachal Pradesh, Meghalaya and Nagaland).

The composition of users by contraceptive method also shows significant spatial variation. Table A3 shows the percentages of currently married women who are using modern temporary methods (IUD, pill and condom), and traditional methods (periodic abstinence, withdrawal, etc), separately. The percentage of sterilisation users can be obtained from the data as a residual. Figure 11 presents a map showing the spatial variation in the percentage of temporary method users (both modern and traditional) among all method users. At the national level, only one-fourth of the users of contraception were using a temporary method. However, adopters of temporary methods accounted for a sizeable portion of contraceptive users in the entire sub-Himalayan belt running from Punjab to Arunachal Pradesh. Both in the western and eastern extremes of this region percentage of temporary method users accounted for about half of all users.

However in the western extreme, condom use was more common and in the eastern end, traditional method users (mainly periodic abstinence) predominated. In the other parts of the country, temporary method use was sporadic, except in the west coast of India and in the extreme south. Even where it was relatively high, it did not exceed 30 per cent of all users.

The NFHS data on contraceptive prevalence rate by regional divisions can be cross-checked using the data on couple protection rate derived from the service statistics. However, it would not serve any great purpose, except to highlight the many limitations of the official statistics. The NFHS estimates on contraceptive practice are not subject to significant sampling errors and the relevant data were not too difficult to collect. However, it is not clear whether different methods being used have the same effect on fertility. In particular, the protection against the risk of conception conferred by traditional methods and condom use may be limited.

Proximate determinants of maternal and child mortality: Of the four proximate determinants discussed here, the indicators of maternal care would be considered first as they show similar patterns of spatial variation. The data on maternal care were collected in the NFHS for all the births that occurred to women during the four years preceding the interview. We have however used data only for the last birth

that occurred in this period. The bias resulting from restricting the sample to the last birth is negligible, while it considerably simplifies the data analysis. Of the several indicators of maternal care on which the NFHS has provided data, we have selected two, the percentage of women who received antenatal care during pregnancy and percentage of births attended by a trained health professional. In Table A3, data have also been provided on institutional births, but they would not be taken up for discussion here.

In the country as a whole, 65 per cent of the women reported that they had received antenatal care (ANC) during the last pregnancy, but the regional estimates suggest a range of variation from 22 in the extremely arid region of Rajasthan to 100 per cent in the central coast of Kerala. As Figure 12 shows, level of antenatal care was over 80 per cent in most areas of peninsular India. In coastal areas and in the extreme south, the levels crossed the 90 per cent mark. The relatively backward regions in this respect were Marathwada, Hyderabad-Karnataka region and Orissa. Elsewhere in India, relatively high levels of ANC have been reported in north western region, south Bengal and Mizoram. The most backward areas, where ANC levels are under 50 per cent, were Rajasthan, Bihar, northern and eastern Madhya Pradesh, most regions of Uttar Pradesh and north-western parts of Assam valley.

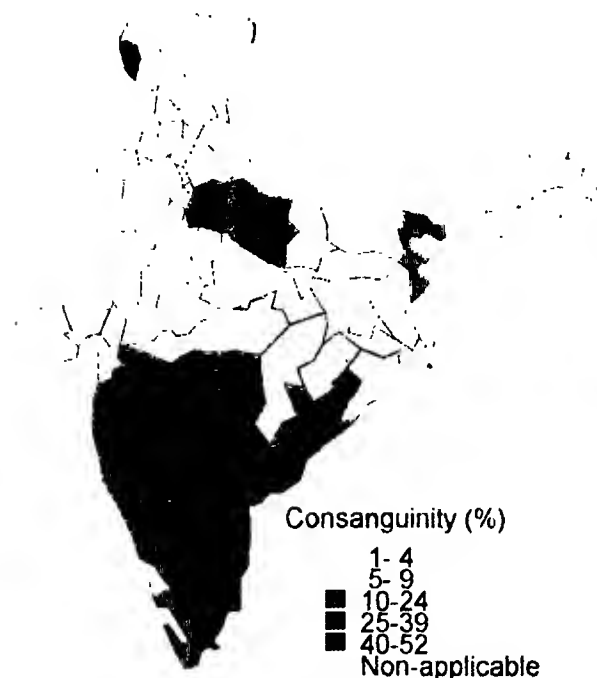

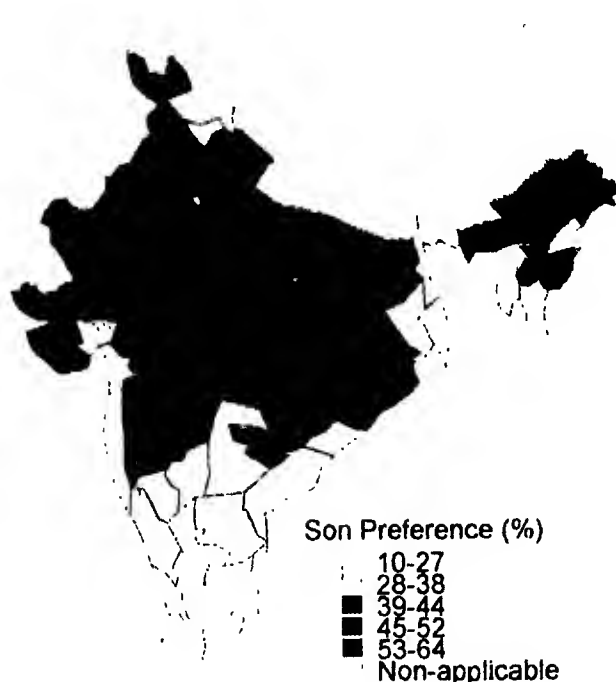

FIGURE 24: PERCENTAGE OF WOMEN WHO WANTED MORE BOYS THAN GIRLS IN THEIR IDEAL FAMILY SIZE. 76 REGIONAL DIVISIONS, NFHS, 1992-93

The data on assistance at deliveries show that 36 per cent of the births were attended by trained health professionals in India as a whole. But regional estimates varied from 12 per cent in desert region of Rajasthan to 99 per cent in the central Kerala coast. The spatial variation is very similar to that of ANC (Figure 13). High levels were reported in almost entire peninsular India (except the central semi-arid stretch, and Orissa). In the continental part, regions reporting high levels of birth attended by trained personnel were either in the north-western region or near the Bay of Bengal. The entire middle stretch starting from western Rajasthan to Bihar was the most backward area in this respect. Assam and northern states of north-eastern India also performed poorly.

We shall now take up for discussion the two indicators related to child health and survival: immunisation and nutrition. The immunisation indicator shows the percentage of fully immunised children among those who were aged 12 to 23 months at the time of the survey. Children who had a BCG vaccination, three polio drops, three DPT and one measles vaccination at any time before the interview have been taken to be fully immunised. The age cut-off of 12-23 months has the effect of reducing the sample sizes considerably (sample per region was in the range of 100-150 children). Nonetheless the variable shows regional pattern of variation similar to that of the two maternal care

variables (Figure 14). Some differences in details are as follows. In the 76 regions the percentage of fully immunised children varied from 12 in Nagaland to 79 in Bist Doab of Punjab. All regions of Maharashtra and Tamil Nadu showed high levels of immunisation, but none of the regions had reached universal immunisation. Generally, the range here was between 50-75 per cent. Interestingly, Kerala lagged behind in this respect, but primarily because of south Malabar and Hill districts, where less than 35 per cent of the children were fully immunised. The entire Andhra Pradesh and northern Karnataka in the south also showed relatively poor levels of immunisation coverage. In the north, the north-western region showed high coverage. The backward regions where immunisation levels did not rise above 25 per cent were in Rajasthan, Bihar, Uttar Pradesh, excluding the Kumaon region, Assam valley and north-eastern states.

One of the significant contributions of the NFHS was in assessing levels of malnutrition among children through anthropometric measures. The weight of children under four years old was measured using a spring balance (Slaier scale), and height was measured in the lying position for children under two years of age and in the standing position for older children. Unfortunately, the height measurement was not taken in a group of states that were in the first phase of the survey.

Therefore we have extracted only weight-for-age data from the NFHS data files for all the children under four years of age.

The percentage of underweight children was estimated by comparing children's weight for age with an international reference population of well-fed children recommended by the World Health Organisation (1983). Children who were more than two standard deviation units below the median of this standard were considered as underweight. The computations were made using the ANTHRO software package of the Centre for Disease Control, Atlanta, US. This programme flags children who had improbable weight (or height) for their age. In the NFHS reports the percentages of malnourished children reported are those that were computed after excluding such children from the sample. The number of such dropped cases was about 6 per cent of all children at the all-India level.

It is, however, not clear as to whether such children should be dropped, as it may lead to selective omission of children whose ages were underreported (or overreported). We have computed the levels of malnutrition by omitting as well as including these children, but have found the differences to be very marginal. In order to maintain the comparability with the figures presented in the NFHS reports, in Table A3 we have shown the percentages of malnourished children after omitting the 'flagged' children, even though

it amounted to significant loss of cases. The weight-for-age data from the NFHS suggest a very high level of child malnutrition in India. While as much as 54 per cent of the children were underweight for their age at the all-India level, less than 3 per cent of children fell into this category in the international standard population.

Figure 15 displays a map showing the regional variation in child malnutrition as measured by weight for age. The percentage of malnourished children varies from 14 per cent in Rajasthan desert to 68 per cent in Chhattisgarh and Bastar region of Madhya Pradesh. Since fieldwork in the desert region of Rajasthan was probably not of high quality, we may take the next lowest figure of 24 per cent in north Malabar (21 per cent if all children are considered) as the best region in India in this respect. But against the international standard population's 3 per cent mark, even this figure seems too high.

The NFHS anthropometric data show relatively better nutritional status of children on the west coast of India, Saurashtra, Coromandel and Andhra coasts, north-western plains and hills, and north-eastern states. On the other hand, relatively poor nutritional status of children is reported from Bihar, Uttar Pradesh, Madhya Pradesh, Orissa, West Bengal, north Gujarat, much of Maharashtra Plateau, Hyderabad-Karnataka region and Rayalaseema.

How do the regional estimates of child malnutrition compare with regional patterns in child mortality? A scatter plot of the two is shown in Figure 16. The overall correlation between the two is 0.71. Given that there are other factors influencing child mortality and malnutrition, this should be termed as a satisfactory correspondence.

Programmatic variables: Unfortunately there are not many programmatic variables on which the first round of NFHS had collected data. A lot more is being promised in the second round of the NFHS that is currently in progress. From the first round, we have selected two variables, the frequency of home visits by the health workers and the media-reach on family planning.

In the NFHS, information on two types of home visits was gathered. First, women were asked whether they had received any visit from a health worker for antenatal check-up during pregnancy for children born during the four years preceding the survey. Second, users of family planning methods were asked whether they had received a follow-up visit from a health worker after acceptance. As home visits are made only in rural areas, the 2 percentages were computed for rural areas of each

region, and are shown in Table A3. In addition, we have computed the weighted average of the 2 percentages to reflect the extent of home visits being made by the health workers in rural areas for either ANC or follow-up services. The combined index has substantially lower sampling error than its two constituents have. Hence it is being used here.

Figure 17 displays the map showing the spatial variation in the home visits made by health workers, primarily by the auxiliary nurse-midwife. At the national level, home visits by the ANM were reported by only 29 per cent of the women who were eligible for such visits. In the 76 regions, this percentage varied from just 2 in Arunachal Pradesh to 61 in southern Karnataka. The regions that fall in the top 20 per cent bracket were in Karnataka, Gujarat, Konkan and coastal Andhra. Overall, the frequency of home visits was above average in peninsular India, including Orissa and southern and eastern parts of Madhya Pradesh. Interestingly, Kerala and parts of Maharashtra fared poorly in this regard. In much of north and eastern regions of India, health workers rarely made home visits even in rural areas. In Assam and north-eastern India, Bihar plateau, and arid regions of Rajasthan such visits are extremely rare.

To explore the reach of mass media, respondents in the NFHS were asked whether they listened to radio at least once a week, watch television at least once a week, and went to cinema at least once in a month. The respondents were also asked specifically, whether they heard a family planning message on radio or television during the month prior to the survey. From answers to these questions it was possible to compute the exposure to each of the mass media, or any of the media, and percentage of women who said that they had heard a family planning message on the electronic media. All these percentages have been shown in Table A3 of the Appendix. Here however, we shall discuss only one of them, percentage of women exposed to any media. Figure 18 displays the map showing the spatial variation in this variable.

At the national level 53 per cent of women reported regular exposure to mass media. But in the 76 regions, the exposure varied from 24 per cent in north Bihar plains to 88 per cent in central Kerala coast. In general, exposure to mass media was very high on the west coast of India, Tamil Nadu, Andhra Pradesh and southern Karnataka. The exposure levels were moderate in Gujarat and interior Maharashtra. In the north, areas of high

exposure were concentrated in north-western regions and around the Bay of Bengal. In much of northern plains and central uplands, media exposure was quite low (under 40 per cent). Obviously, both low exposure to mass media and infrequent field visits by health workers posed severe problems in spreading health and family planning messages in the relatively high fertility regions of northern India.

IV Socio-Economic Variables

From the NFHS data files, we have extracted the following socio-economic variables which we thought could have a significant influence on demographic processes: asset holdings, joint households, female work participation, female literacy, percentage of Muslims, son preference, consanguinity, natal links and numeracy in ideal family size. Among these, data on female literacy and Muslim population have already been discussed. The space and time constraint does not permit us to discuss all of the remaining variables in detail. We shall therefore concentrate on variables on whose spatial variation not much is known yet.

One such variable is income or poverty. The NFHS made no direct attempt to measure income because of the well known problems in collecting this information. However, data on ownership of several household assets and consumer durable goods were collected, from which an index can be constructed to assess the wealth status of households or the standard of living of its members. This measure can be computed by assigning weights to various asset holdings. These weights could be arbitrarily assigned or arrived at by factor analysis. Although factor analytical approach is statistically more rigorous, it does not directly take into account either the substitutability of assets or their market price. A simpler approach that makes the weights inversely proportional to the proportion of population owning the asset is perhaps more appropriate in this case. In order to make the quantity consumed/owned correctly reflect the relative prices, population should be homogeneous with respect to tastes.

Table 3 shows the data on household ownership of some selected assets in rural and urban India. The assets considered are ownership of livestock, irrigated and non-irrigated land, type of house (pucca or semi-pucca), its electrification, and eight consumer durable goods, ranging from clock/watch to motor car. Items that were thought to be largely determined by supply factors were kept out of the list (e.g., access

to safe drinking water). There is considerable difference between urban and rural areas in the structure of asset ownership. Not surprisingly, ownership of land and livestock was much more common in rural areas and consumer durable goods in urban areas. This difference could not solely be due to the difference in urban-rural incomes; parts of it must be due to differences in the structure of economy, and in preference patterns. Land being such an important asset in rural areas, it does not seem proper to compute a composite asset index by excluding it.

Therefore we decided to construct the asset index for rural areas only. Examination of asset ownership patterns in rural areas showed that certain consumer goods such as refrigerator and car would get too high a weight in the composite index if one goes solely on the basis of the inverse of possession ratios. Therefore we assigned a weight to each asset that ranged from a minimum of one to a maximum of three, roughly in accordance with their inverse possession ratios (Table 3). The asset index so constructed had a range of 0 to 29 at the household level. At the regional level, two different forms of this index have been used. First is the mean value of the index, which is a sort of proxy for income (or wealth status). The second is the proportion of rural households in the region that had an asset score of less than five. This is intended as a proxy measure for poverty. The index score of 5 was chosen as the poverty line because 34 per cent of rural households at the all-India level had asset scores lower than this. That the two measures can be interpreted in this manner is borne out by their scatter plot shown in Figure 19. As can be seen, as the mean asset score rises from about four to 10, the percentage of households with asset scores of less than five falls quite rapidly from about 60 per cent to 10 per cent. But further increase in the mean asset score brings only very small reductions in the estimated percentages of households with a low asset score.

The regional estimates of both forms of the asset index measure are given in Table A3. Figure 20 shows the map of the regional estimates of the asset-poverty index. The index varied from 3 per cent in Himachal Pradesh to 62 per cent in southern plateau region of Orissa. A clear east-west divide is discernible in the spatial variation of rural poverty. The index suggests high levels of poverty in Assam, Bihar and on the entire east coast of India. The regions adjoining them, namely, West Bengal, interior-Orissa and eastern Madhya Pradesh, Narmada valley, semi-arid parts

of Deccan Plateau and eastern uplands of Tamil Nadu, also show high levels of poverty. On the other hand, regions with low poverty are to be found in the north-western India, Saurashtra and west coast of India. The only region in the west that shows comparatively high poverty level is the desert region of Rajasthan.

Much has been written about the relationship between poverty and malnutrition. Interestingly however, our regional estimates of the two do not suggest strong correspondence (Figure 21). Although there are regions where both rural poverty and child malnutrition levels are estimated to be high (e.g., Bihar, Mahanadi basin, semi-arid regions of Deccan plateau), the overall correlation between the two is only 0.38. Assuming that our poverty estimates are not grossly misleading, there must be a lot more to the nutritional problem than simply the poverty level. As Sukhatme argued for malnutrition, diet and disease environment matter more than simply the purchasing power of households (e.g., Sukhatme 1987). Our finding that regional estimates of child malnutrition are strongly correlated with child mortality rates, but not with asset holdings of households is consistent with this view.

Another economic variable on which the NFHS has collected data is on current work status of women. As the survey was carried out in different months in different states, the data could be affected by the seasonality factor. Another limitation is that the data refer only to ever-married women in the age interval 13-49 years. At the national level, 31 per cent of the women were working, 12 per cent as unpaid family workers, 16 per cent as employees and 3 per cent as self-employed. Table A3 shows the percentage of women who were economically active and percentage of women who were employed by someone else in the 76 regional divisions. The two indicators show more or less similar patterns of regional variation. Work participation by women was high in Andhra Pradesh, Tamil Nadu and interior parts of Karnataka and Maharashtra; it was relatively low on the west coast of India, and infrequent in much of north India (map not shown).

We shall now turn our attention to a few socio-cultural variables that are commonly thought to have significant bearing on demographic processes, especially fertility levels. One such variable is the prevalence of joint families. The joint family system is expected to promote high fertility because, young women in joint families enjoy less autonomy, costs and care of children are shared, new ideas and innovations are likely to be resisted. Since

the seminal analysis of the 1961 Census data and other ethnographic materials by Kolenda (1987), to the best of our knowledge, there has not been any systematic attempt to study the regional patterns in family structure. We therefore examined the NFHS data on this issue, though the information was not tabulated in the published survey reports. We have used a fairly broad definition of the joint family, wherein more than one married or widowed or divorced or separated persons of the same sex are living together. Thus it is inclusive of 'supplemented-nuclear' family wherein a married son along with his wife lives with a widowed mother or widowed father.

In Table A3 of the Appendix, we have given two relevant statistics in the regard, per cent of households that were joint, and percentage of ever-married women in the age group 15-49 living in a joint household. That the joint family continues to be a fairly common type of living arrangement is revealed by the fact that at the national level 44 per cent of the households covered in the NFHS were joint, and 58 per cent of ever-married women of reproductive ages were living in joint households. Thus the unit of analysis - households versus individuals - matters in measuring the extent of joint family living in India. However both measures suggest similar regional patterns. Figure 22 shows the map of percentage of joint households by regional divisions. The prevalence of joint households varied from 17 per cent in Nagaland to 59 per cent in eastern Uttar Pradesh. The joint households are more common in north India, excluding the sub-Himalayan region. In the south, joint households are more frequent only in Maharashtra plateau and northern Karnataka. They are relatively rare in north eastern-region of India, and in the south, especially Tamil Nadu. Kolenda's hypothesis that joint families are more prevalent in the Gangetic plains than in central India is not supported by our data. However the data confirms the assertion that the proportion of joint families is higher in north Karnataka compared to the Konkan region. In fact, the data suggest that the entire Maharashtra plateau had a high prevalence of joint families.

Consanguinity, marriage between blood relatives, is another significant sociological variable relevant to the fertility of couples and mortality and morbidity of their children. All ever-married women in the NFHS sample were asked whether they were related to their husband before marriage. Although the collected data are not detailed enough to compute an inbreeding

coefficient, they are sufficient to indicate the extent of consanguinity in the population. At the national level, 15 per cent of ever-married women had married a blood relative. Figure 23 displays a map showing the regional variation in consanguinity. The practice appears to be confined primarily to Tamil Nadu, Deccan plateau and coastal Andhra Pradesh. In these regions, the percentage of consanguineous marriages rose to 40 to 50 per cent of all marriages. On the west coast, consanguineous marriages were less frequent, and accounted for only 10 to 20 per cent of marriages. In the rest of India, consanguineous marriages were extremely rare, generally as low as 2 per cent. However, in west Jammu 34 per cent of marriages were consanguineous perhaps due to the custom of cross-cousin marriages among Muslims of this region.

Son preference is known to be another important socio-cultural factor influencing fertility levels in India. The existence of son preference can be demonstrated by several means. The most direct method is to examine the sex composition of ideal family size. The percentage of ever married women who reported more boys than girls in their ideal family size has been shown in Table A3 for each region. Figure 24 displays the map showing the spatial variation in this son preference index. A very clear north-south divide can be observed in the map. At the national level, 42 per cent of women had reported preference for more boys than girls in their ideal family size. The proportion of women wanting more boys than girls varied from 10 per cent in Koppunad region of Tamil Nadu to 64 per cent in Bundelkhand region of Uttar Pradesh. In the entire northern plains and central upland regions, son preference is quite strong and more than 50 per cent of the women reported more boys than girls in their ideal family size. Son preference gradually diminished as one moves south of Satpura hill range, and attained low levels in Tamil Nadu. Interestingly, on this indicator, coastal regions of peninsular India did not outperform the interior regions. In the east, West Bengal, Assam and north-eastern states showed relatively moderate degrees of son preference. There also is a pocket around Himachal Pradesh where son preference is of moderate intensity.

We shall briefly discuss two other indicators on which data were extracted from the NFHS data files. One of these is the percentage of home deliveries that occurred in the natal home of the women. The variable could be used as an indicator of the continued contact of a married woman

Appendix

TABLE A1: REGIONAL CLASSIFICATION OF DISTRICTS AND SAMPLE SIZE BY REGIONS IN NFHS, 1992-93

States and Regions*	Districts in the Region as per 1991 Census	Sample Households	Sample Ever-Married Women
Andhra Pradesh		4,208	4,276
1 North Coast	Srikakulam, Vizianagaram, Visakhapatnam.	544	515
2 South Coast	East Godavari, West Godavari, Krishna, Guntur, Prakasam, Nellore.	1,422	1,384
3 Rayalaseema	Chittoor, Cuddapah, Anantapur, Kurnool.	692	701
4 Telengana	Mahbubnagar, Rangareddy, Hyderabad, Madak, Nizamabad, Adilabad, Nalgonda.	1,012	1,125
5 Godavari Depression	Karimnagar, Warangal, Khammam.	538	551
Assam		3,255	3,006
6 NW Valley	Goalpara, Kamrup, Marigaon, Nagaon.	808	755
7 SW Valley	Dhubri, Bongaigaon, Barpeta, Nalbari, Sonitpur.	1,011	946
8 E Valley and Cachar	Golaghat, Jorhat, Sibsagar, Dibrugarh, Tinsukia, Karbi Anglong, Lakhimpur, Dhemaji, Cachar, Karimganj, Hailakandi.	1,436	1,305
Bihar		4,748	5,949
9 N Plain	Purnia, Araria, Kishanganj, Darbhanga, Madhubani, Sitamarhi, Muzzafarpur, Vaishali, Saran, Siwan, Gopalganj, Pashchim Champaran, Purba Champaran, Samastipur, Saharsa, Madhepura, Katihar.	2,150	2,663
10 S Plain	Begusarai, Nalanda, Aurangabad, Patna, Rohtas, Bhojpur, Khatwa, Munger, Bhagalpur, Nawada, Jehanabad, Gaya.	1,333	1,737
11 S Plateau	Godda, Sahibganj, Dumka, Deoghar, Palamu, Lohardaga, Gumla, Ranchi, Dhanbad, Giridih, Hazaribagh, Pashchim and Purbi Singhbhum.	1,265	1,549
Gujarat		3,875	3,832
12 Saurashtra	Jamnagar, Rajkot, Surendranagar, Bhavnagar, Amreli, Junagadh.	1,012	1,015
13 Kachchh and N Plain	Kachchh, Banaskantha, Sabarkantha, Mahesana.	815	743

with her natal family. In regions where the natal family is expected to take the responsibility of maternal and child care services, they may be the ones who motivate the daughter to accept family planning [Raju 1998]. As sterilisation of females is generally done following delivery, either the direct or indirect involvement of natal family in the decision-making process could be suspected. At the national level, only 14 per cent of the home deliveries were in natal home, but they were generally over 25 per cent in east coast and plateau regions of peninsular India.

Another variable we thought useful from the point of view of fertility analysis is the extent of non-numeric responses to the question on ideal family size. It is claimed that one of the pre-conditions for secular declines in fertility is that family sizes should come within the 'calculus of conscious choice', and the sign that this is occurring can be gleaned from the percentage of women who report 'up to God' and other non-numeric responses to the survey questions on ideal or desired family size [van de Walle 1992]. Therefore we have shown in Table A3 the percentage of women who gave non-numeric responses to the question on ideal family size in the NFHS. At the national level, only 10 per cent of the women gave non-numeric responses, and regional estimates varied from 0.2 to 26 per cent. The high fertility regions of north India did have relatively more women giving non-numeric responses; but some regions in the south too reported comparatively high percentage of such women (Andhra Pradesh, Karnataka and Kerala). Perhaps interviewer biases also influenced the recording of answers to this question.

V

Slums and Affluent Colonies of Delhi

An issue on which data are urgently needed but were not provided in the NFHS reports relates to the health and living conditions in slums of large cities. Small sample size prevented the presentation of such information. While this limitation holds for most cities, the case of Delhi is different. In urban areas of Delhi, a total of 3,377 households and 3,189 ever-married women were interviewed from 225 urban blocks. This sample size should be large enough to permit separate estimates for slum-dwellers. Unfortunately, in order to conceal their identity, codes of primary sampling units (PSUs) of the survey have been randomised before the NFHS data files were made available for public use. Appreciating the need for separate data for slums, we made an at-

tempt to identify the PSUs that were in slum areas by examining the characteristics of respondents. We focused on two characteristics of sample PSUs, literacy level of sampled women and percentage of women who had lived in a village until they were 12 years old (thus migrants to Delhi). Even though the average sample size for a PSU was only 14 women, the two variables had a fairly high correlation (-0.68). PSUs with a literacy rate of under 60 per cent and over 40 per cent migrants among women were classified as belonging to slum areas. PSUs with a literacy rate of over 60 per cent and migrant population of under 40 per cent were classified as belonging to non-slum areas. All other PSUs were categorised as 'semi-slums'. The threshold levels of literacy and migration were so chosen that sample women in slums would be close to the percentage of slum population in Delhi. The end result of this exercise was that 34 per cent of ever-married women in 79 PSUs were classified as slum-dwellers, 25 per cent of women in 54 PSUs as residents of 'semi-slum' settlements and 41 per cent of women in 92 PSUs as living in non-slum areas. In terms of households the distribution was 37 per cent in slums, 24 per cent in semi-slums and 39 per cent in non-slums.

Table 4 gives information on 29 selected indicators derived from the NFHS data files for slums and non-slum areas of the city. Table A3 of the Appendix shows data for a few more variables. For ready comparison, in Table 4 we have also shown data for Uttar Pradesh and Bihar. According to the 1991 Census, these two states accounted for two-thirds of net migrants to Delhi during the 10-year period preceding the census (55 per cent from Uttar Pradesh and 13 per cent from Bihar).

The data on housing conditions show that 63 per cent of slum households were living in pucca houses whereas 87 and 93 per cent of households were living in such houses in semi-slum and non-slum areas, respectively. One would have expected a much worse situation in the slums. This may cast some doubt on the validity of the criteria used for defining a slum. However, it may be noted that 80 per cent of dwelling units in urban Delhi have been classified as pucca in the NFHS. According to the 1991 Census its percentage is even higher (85 per cent). Since about 30-50 per cent of Delhi's population is considered to be living in slums [Mitra 1994], a significant percentage of slum-dwellers must be living in pucca houses.

Even though 90 per cent of dwelling units in slums had an electricity connection, they were overcrowded with 3.4

Appendix

TABLE A2: DETAILED DESCRIPTION OF VARIABLES EXTRACTED FROM NFHS DATA FILES FOR 76 REGIONAL DIVISIONS

Sl No	Variable Name	Description
1	FLIT	Percentage of literate females. The 1991 Census data is for ages 7+ whereas the NFHS data is for ever-married women of ages 13-49 years.
2	MUSLIM	Percentage of Muslims. The 1991 Census data is for all members of the household whereas the NFHS data is for ever-married women of ages 13-49 years.
3	TFR	Total fertility rate. The estimate from the census is for 1990 and from the NFHS is for 1987-88. The 1991 Census estimate was derived from the birth-order distribution of births during the year preceding the census. The NFHS estimate was derived from the births to women 0-9 years before the survey. It may have a slight downward bias owing to exclusion of births to non-surveyed women of ages 50 years and over.
4	q5	Graduated estimate of under-5 mortality rate per 1000 live births. The estimates refer approximately to the period 1986-88. Both 1991 Census and NFHS estimates were derived indirectly from the data on children ever born and children surviving. In the case of census, graduation is based on separate estimates of q2, and q3, and in the case of NFHS it is based on q2, q3 q5, and q11.
5	CFS	Completed family size (i.e. mean children ever-born) of women aged 40-49 at the time of the NFHS, 1992-93.
6	SMAM	Mean age at first marriage of females computed from age-sex-marital status data of the sample population.
7	CMW	Percentage of currently married women in the age interval 15-49 years.
8	CPR	Percentage of currently married women who were using a method of family planning at the time of the survey.
9	MOD	Percentage of currently married women who were using a modern, temporary method of family planning at the time of the survey.
10	TRAD	Percentage of currently married women who were using a traditional method of family planning at the time of the survey.
11	AWAY	Percentage of currently married women whose husbands were not staying with them at the time of the survey.
12	ANCR	Percentage of women who received antenatal care during pregnancy of their last birth that occurred during the four years preceding the survey.
13	PUBL	Percentage of births delivered in public institutions among the last births that occurred during the four years preceding the survey.
14	PRIV	Percentage of births delivered in private institutions among the last births that occurred during the four years preceding the survey.
15	ATTND	Percentage of births assisted by trained health professionals among the last births that occurred during the four years preceding the survey.
16	CIMMU	Percentage of fully immunised children (BCG+3 DPT+3 Polio+ Measles vaccinations) among those aged 12-23 months at the time of the survey.
17	MAL	Percentage of children 1-47 months who were underweight (below -2SD of the WHO/NCHS standard) for their reported age (excludes children of 'improbable' weight).
18	FOLO	Percentage of current users of modern family planning methods in rural areas who after acceptance received follow-up visit at home from a health worker.
19	ANCS	Percentage of women in rural areas who were visited at home by a health worker for antenatal care among those who had their last birth during the four years preceding the survey.
20	AVIST	Percentage of women in rural areas who were visited by a health worker at home either for antenatal care or for family planning follow-up services, among those who are eligible for such visits.
21	KNOW	Percentage of ever-married women reporting the knowledge of at least one modern, temporary method of family planning (includes women who reported the knowledge after probe).
22	M-RDIO	Percentage of ever-married women reporting that they heard a family planning message on radio in the month prior to the interview.
23	M-TV	Percentage of ever-married women reporting that they saw a family planning message on television in the month prior to the interview.
24	M-ANY	Percentage of ever-married women reporting that they heard a radio or television message on family planning in the month prior to the interview.
25	MEAN	Mean score of the asset index. This is a weighted index constructed from the data on household's ownership of irrigated and non-irrigated land, livestock, type of house, its electrification, and possession of eight consumer durable goods. The weight given for each asset was inversely related to the proportion of rural households holding that asset. The index has a range of variation from 0 to 29.
26	BLINE	Percentage of rural households having an asset score of less than 5.
27	WORK	Percentage of ever-married women who reported that they were currently working, aside from own housework.
28	WAGE	Percentage of ever-married women who were employed by someone else.
29	E-RDIO	Percentage of ever-married women who listened to radio at least once a week.
30	E-TV	Percentage of ever-married women who watched television at least once a week.
31	E-CIN	Percentage of ever-married women who went to a cinema at least once a month.
32	E-ANY	Percentage of ever-married women who were regularly exposed to any media.
33	SONPR	Percentage of ever-married women who reported more number of boys than girls in their ideal family size.
34	JHH	Percentage of joint households. The joint household is taken to be one where more than one married/widowed/divorced/separated person of the same sex are living together.
35	MWJH	Percentage of ever-married women of ages 15-49 years living in a joint household.
36	INBRD	Percentage of ever-married women who were married to a blood relative.
37	NATAL	Percentage of home deliveries during the four years prior to the survey that were delivered in the natal home of the woman.
38	NNUM	Percentage of ever-married women who gave non-numeric response to the question on ideal family size.

persons per room. In comparison, the number of persons per room was 2.7 in semi-slum and 1.9 in non-slums. About three-fourths of the slum households had access to piped drinking water and over half of the households had either own or shared flush toilet. Almost half of the slum households had radio or television sets, which seem to have become an integral part of metropolitan living. A little over 40 per cent of slum households owned a bicycle; the same was true for households in non-slum areas. Of course, households in affluent parts of the city also owned motorcycles/scooters (47 per cent) and cars (20 per cent). However, what distinguished the slum and non-slum households the most was the use of gas/electricity for cooking and possession of a refrigerator. Only 20 per cent of the households in slums used gas/electricity for cooking, as against 59 per cent in semi-slums and 82 per cent in non-slum areas. Similarly, only 11 per cent of slum-dwellers had a refrigerator as against 42 per cent of the semi-slum dwellers and 75 per cent of the non-slum residents.

Although living conditions in slums were worse than in non-slums, they were distinctly better than those prevailing in states from where a majority of the migrants come. In Bihar and Uttar Pradesh, only 15-25 per cent of the residential houses were classified as pucca; only 15-30 per cent had an electricity connection; 10-20 per cent had piped water supply; 13 per cent had a flush toilet; 25-30 per cent had a radio; 10-15 per cent had a television set. Only on two indicators residents of the two states had a slight edge over the slum-dwellers in Delhi: With 2.8 to 3.0 persons per room, dwelling units were less overcrowded, and 40-60 per cent of the households had a bicycle. It may, however, be kept in mind that the state-level figures probably give better than actual account of living conditions in places of origin because among migrants in slums the proportion of those from rural areas must be higher than the proportion of the rural population in the state.

On health and mortality also, Delhi slums fared better than the states of Uttar Pradesh and Bihar. The estimated under-five mortality rate was about 122 per thousand in slums, 93 in semi-slums and 54 in non-slum areas around 1986-87. On the other hand, the rate was 154 in Bihar and 183 in Uttar Pradesh. The same picture emerges with respect to maternal and child care. While in Delhi slums 78 per cent of the pregnant women had received antenatal care and 50 per cent of the children were fully immunised, corresponding figures

for Bihar and Uttar Pradesh ranged around 40-50 per cent and 18-19 per cent, respectively. However, there was not much difference between Delhi slums and the two main states of their origin with respect to child malnutrition. If 52 per cent of children of under age four years were underweight for their age in Delhi slums, it was 51 per cent in Uttar Pradesh and 62 per cent in Bihar. Of course, there was a significant difference between slum areas and non-slum areas in Delhi in this respect. The percentage of underweight children was 52 in slums, 34 in semi-slums and 30 in non-slum areas of Delhi.

The situation with respect to fertility and family planning too was not much different. Around 1987-88, the level of TFR was 4.5 in slums, 3.5 in semi-slums and 2.5 in non-slum areas. In comparison, in Uttar Pradesh and Bihar it was 5.3 and 4.8, respectively. A comparison of TFR with CFS indicated that fertility decline in recent years was larger in semi-slum localities (1.2 births) than either in slums (0.6 births) or in non-slum regions (0.8 births). The differentials in fertility levels were associated with variations in age at marriage of females and in contraceptive practice. For example, the mean age at marriage was 19 years in the slums of Delhi, while it was 17 to 18 years in Bihar and Uttar Pradesh; about half the currently married women in Delhi slums were using a method of family planning but only one out of five women in Bihar and Uttar Pradesh was doing so. Interestingly, even the son-preference index showed similar patterns of variation. In Bihar and Uttar Pradesh about 56 per cent of women had reported more boys than girls in their ideal family size, but figures were 40 per cent in the slums of Delhi, 35 per cent in semi-slums and 20 per cent in non-slums. The downward trend in son preference with better living conditions in Delhi is certainly encouraging.

Why do slums of Delhi fare better than the areas from where they receive migrants? Some answers to this question can be found in the differentials with respect to their characteristics. If only 22 to 24 per cent of ever-married women were literate in Bihar and Uttar Pradesh, 34 per cent of the women were literate in slums of Delhi, even though this is substantially lower than the 89 per cent in non-slum areas. Similar differences could also be found in the literacy level of their husbands. The slum-dwellers of Delhi also had a relatively high exposure to mass media. Over 76 per cent of women in slums of Delhi were regularly exposed to the mass media, whereas only 30-35 per

cent of women in Bihar and Uttar Pradesh enjoyed such exposure.

Differences between slums and non-slum areas on a few other social indicators may also be of interest: about 13 per cent of slum-dwellers were Muslim, whereas they constituted 11 per cent of the semi-slum population and only 6 per cent of the non-slum residents. Evidently, poverty was higher among Muslims. The joint households were somewhat more common in non-slum areas than in slums (36 and 31 per cent, respectively). The large difference between the prevalence of joint households among slum-dwellers in Delhi and in their place of origin in Uttar Pradesh and Bihar (56 per cent) shows that urbanisation has led to nucleation of households, probably because of the scarcity of space in the dwelling units. The observed differentials in work participation rate of women were small. There was, however, a suggestion of a U-shaped pattern of variation with affluence in the percentage of women working for wages or salaries; about 11 per cent of women in slums were working for wages or salaries, as against 10 per cent in semi-slums and 13 per cent in non-slums. On the other hand, unpaid work declined with better living conditions: 10 per cent in slums, 9 per cent in semi-slums and 8 per cent in non-slums.

VI Conclusions

The foregoing analysis shows that the rich data from the first NFHS can profitably be analysed at the regional level. The strong geographical clustering of regions on many variables and the gradual spatial progression seen from high to low values prove that sampling variability is not a major obstacle to such an analysis. It has been further shown that the regional estimates computed by pooling the 1991 Census data on indicators on which information can be collected with relative ease, such as on literacy and religion, compare well with those derived from the NFHS. However, on indicators of fertility and mortality, the experience is mixed. On fertility, the levels and regional patterns suggested by the NFHS data are consistent with those obtained indirectly from the birth-order information from the census, except for some north-eastern states, where the NFHS appears to have underestimated fertility levels. On child mortality, the NFHS data not only suggest substantially higher levels than the census, but the indicated regional pattern also differs from that derived from the census data. Even though the estimates of child mortality from the NFHS were subject to greater sampling

Appendix

variability, the major share of the blame for the inconsistency should go to the poor quality of the census data on this subject.

The regional analysis of the NFHS data confirms that fertility has been declining everywhere: among the 76 regions considered in the analysis, there was not even a single one where the decline was not evident. Interestingly, declines in fertility during mid-1970s to late 1980s were not related to the initial level. However, there was a clear regional difference: in the extreme south (covering Kerala, Tamil Nadu, and parts of Karnataka and Andhra Pradesh), west coast of India and Gujarat the decline was more than one birth per woman whereas in the Hindi heartland it was by half a birth or less.

The observed regional variations in the levels of fertility, and the patterns of decline, cast doubts on the validity of any state-specific models of change. One finds four distinct clusters of low fertility regions in the Indian landscape. The two most advanced of these are in the south, along the coastal plains and the interior hill regions. The one on the west coast is both long and broad, and extends even to the Saurashtra peninsula. The narrower region in the east extends up to the north coast of Andhra Pradesh. Both regions become broader at the south end, and converge to form a single region of extremely low fertility. In the north, the cluster of low fertility regions is in the north-western region, comprising of Punjab, Himachal Pradesh, Jammu and northern parts of Haryana and Uttar Pradesh. Fertility levels here are substantially lower than in the Gangetic plains. In the east, the regions around the Bay of Bengal have a lower fertility. This cluster comprises of southern Gangetic delta, Tripura, Mizoram and Manipur. The adjoining regions in Bihar and Orissa too have a relatively low fertility. Such regional clustering is not unique to fertility and contraceptive practice; it is seen also in child mortality, antenatal care, child immunisation, etc.

It is encouraging that even in the so-called BIMARU states, a few regions show some dynamism. They are north-western arid plain and Aravalli hill range in Rajasthan, Malwa and Narmada valley range in Madhya Pradesh, southern plateau of Bihar and the Kumaon region of Uttar Pradesh. The most backward region in each state with respect to eight indicators, asset-poverty, malnutrition, child mortality, maternal and child care, fertility and contraception, and female literacy is shown in Table 5. The table also shows the five most backward regions in India on each of the eight indicators. Finally, an

overall assessment is provided by counting the number of times a region is listed as backward on the eight indicators. According to this assessment, the most backward regions of India are north Bihar plain (Maithila/Tirhut), Bundelkhand, Bhojpur, and south-western plains of Uttar Pradesh, and the extremely arid region of Rajasthan.

Reducing fertility in these regions, and more generally in north India, is a formidable task as they are backward in many respects. They have the highest levels of illiteracy, poverty, malnutrition, child mortality, son preference and joint family living. These problems are compounded by low exposure to mass media and limited extension work carried out by the health staff. In such regions fertility decline is largely guided by a slow process of diffusion, wherein new information and practices get transmitted only through personal contact.

The NFHS data also provide new insights on some old debates, such as the nexus between poverty, malnutrition and disease. The regional estimates of asset-poverty, child malnutrition (measured by weight-for-age) and child mortality show that while there is a strong relationship between child mortality and child malnutrition, that between poverty and malnutrition is weak. The association between malnutrition and disease receives stronger confirmation from the NFHS data than the link between poverty and malnutrition.

The data on the slums of Delhi show that although living conditions and health status of slum dwellers are worse than those of the residents of non-slum areas, they are distinctly better than those prevailing in states from where the majority of migrants to Delhi are drawn. The slum dwellers are particularly better off with respect to type of dwelling units, access to electricity, safe drinking water and flush toilet. They are more likely to own modern electronic goods, such as radio and television. More of their children are immunised and fewer tend to die. Their women are more likely to use antenatal and postnatal care services, and also to adopt a method of family planning. The advantage of slum dwellers seems to be derived from their higher literacy and more extensive exposure to the mass media relative to their counterparts resident in their places of origin. However, it also implies that migration to Delhi would continue until the living conditions in places of origin – mainly in Uttar Pradesh and Bihar – improve to the minimum levels found in cities.

(We are grateful to Pravin Visaria, Director, Institute of Economic Growth, Delhi, for his unflinching support, advice, criticism and patience

during the prolonged period of writing this report. However, the usual disclaimers apply.)

Proximate Determinants of Fertility in India

An Exploration of NFHS Data

Leela Visaria

Variations in fertility are generally examined in terms of socio-economic factors such as education, income, caste, place of residence. These factors can affect fertility only through intermediate variables such as proportion of females married, prevalence of contraceptive use, incidence of induced abortion and the fertility-inhibiting effect on breastfeeding. This article attempts to estimate the values of the proximate determinants of fertility for major states after examining available evidence and interstate variations in these factors.

I Perspective

INDIA, the second most populous country of the world, had a population of 846 million at the time of the 1991 Census and an estimated 950 million at the end of 1997. The implicit average annual growth rate during 1981-91 was 2.1 per cent, only slightly lower than the 2.2 per cent observed during the two decades of 1961-81 [Gol 1993a]. The near-stagnation in the growth rate reflects the downward trends in both mortality and fertility. The continuing welcome decline in the death rate (from about 27 per 1,000 population at the time of India's independence in 1947 to about 10 in 1991) has compensated for the decline in the birth rate, which came down from 45 during the 1950s to 30 in 1991. By 1996, birth and death rates were down to 27 and 9, respectively.

Fertility has declined throughout the country, albeit at a varying pace, as is evident from the data available from the Sample Registration System (SRS) of India [Gol 1993b]. This continuous series of fertility estimates available for nearly 30 years for most of the major states enables us to understand the extent of transition from a relatively high level of fertility to moderate or low levels.¹ As shown in Table 1, among the major states of the country, about 10 per cent of the population (in the two southern states of Kerala and Tamil Nadu with a total population of 85 million in 1991) had already attained a below replacement level or replacement level total fertility rate (TFR) of 2.1 during 1991-93.² In seven other states with a total population of 338 million (40 per cent of the total), the total fertility rate, or the average number of children born to a woman, declined from 6 or more in the 1960s to half that level of close to 3.0 and ranged in a narrow band between 2.8 and 3.1 in 1993. The seven states are Andhra Pradesh, Gujarat, Karnataka, Maharashtra, Orissa, Punjab and West Bengal. Even in the four large north Indian states of Uttar

Pradesh, Bihar, Madhya Pradesh and Rajasthan, with a total population of 336 million (close to 40 per cent of the total), which are regarded as the most backward in terms of demographic transition, the TFR has evidently declined by between 20 to 30 per cent during the past 10 to 20 years and in 1993 ranged between 4.2 and 5.2. Compared to the medium and low variants of the recent 1992 UN projections, [UN 1993, 1994]³ which envisaged for India a TFR of 3.85 and 3.77 during 1990-95, TFR of 3.5 during 1991-93 was nearly 10 per cent lower than the medium projection. At the aggregate all-India level, fertility has declined at a faster rate than was expected by almost anybody.

In 1993, the rural TFR was estimated at 3.8 and urban TFR at 2.8. If rural-urban differences in TFR are presumed to be virtually negligible up to about early 1960s, or before fertility began to decline, rural fertility has declined by about one-third and urban fertility by over 50 per cent from a TFR of 6 in three decades. These figures suggest considerable progress of the order of 54 per cent in rural and 87 per cent in urban areas towards a replacement level of fertility or a TFR of 2.1.⁴ The state-level estimates of TFR in urban areas are often based on a small sample and, therefore, three-year averages are more stable. Such estimates suggest a sharp decline in urban fertility to near or below replacement level not only in Kerala and Tamil Nadu but also in Assam, Himachal Pradesh and West Bengal. Only the four large north Indian states of Bihar, Madhya Pradesh, Rajasthan and Uttar Pradesh reported an urban TFR of between 3.3 and 3.7. This decline in urban fertility, with the urban sector constituting a total population of 215 million according to the 1991 Census (and estimated at 240 million in 1995 [UN 1995]), has considerable significance for the demographic situation in the country as a whole, because continuing interaction between urban and rural populations is likely to generate a fairly strong demonstration effect.

Such variations in fertility are generally examined and understood in terms of socio-economic factors such as education, income, caste, place of residence, etc, and their impact on fertility is measured cross-sectionally or over time, if data permit such an analysis. Research on variables that can explain the maximum variance or on possible pathways that can explain the route to decline in fertility has continued to attract the attention of social scientists, it has also been recognised that socio-economic factors can affect fertility only through intermediate variables, which determine the exposure to intercourse, to conception and carrying the pregnancy to full term such that it results in a livebirth. The analytical framework presented by Davis and Blake (1956: 211-35) nearly 40 years ago listed 11 such intermediate variables. Bongaarts (1982: 179-89) in early 1980s listed seven proximate determinants or the biological or behavioural factors of fertility through which all the socio-cultural and economic processes have to interact with fertility. These are: marriage, natural fecundability or frequency of intercourse, spontaneous intrauterine mortality, induced abortion, post-partum infecundability, use and effectiveness of contraception and onset of permanent sterility [Bongaarts and Potter 1983]. However, the available evidence suggests little variation between populations in the proximate determinants of natural fertility such as the risk of spontaneous intrauterine mortality or in the incidence of permanent sterility or in natural fecundability. Bongaarts demonstrated that 96 per cent of the variance in the fertility levels among societies is explained by the remaining four proximate determinants of regulated fertility or the proportion of females married, the prevalence of contraceptive use, the incidence of induced abortion and the fertility-inhibiting effect of breastfeeding.

In the formulation explicated by Bongaarts, the TFR is expressed as the product of four indices measuring their

fertility-inhibiting effect and the total fecundity rate (TF). The total fecundity rate is the average number of livebirths expected among women who during their entire reproductive period remain married, do not use any contraception, do not have any induced abortion and do not breastfeed their children. In such a hypothetical situation the value of TF is found to vary between 13 and 17, but Bongaarts has suggested the mean value of 15.3 births while testing the model. According to the model,

$$TFR = C(m) * C(c) * C(a) * C(i) * TF$$

where TFR is the total fertility rate, C(m) is the index of proportion of women married, C(c) is the index of contraception, C(a) is the index of induced abortion, C(i) is the index of lactational infecundability, and TF is the total fecundity rate.

Before estimating the values of each of the proximate determinants of fertility for all the major states of India, we need to examine the available evidence on the level and the observed interstate variations in the marriage patterns, breastfeeding practices, use of contraception, and of abortion which affect fertility.

II

Proximate Determinants of Fertility

(a) *Marriage*: The age at marriage (or entry into sexual union) and the proportion of women remaining single determine the number of women exposed to the risk of pregnancy and the duration of time for which they would be exposed to the risk of pregnancy. Throughout the world, women are at risk of pregnancy between the ages of 15 and 50 or for about 35 years. However, this duration is truncated when age at marriage or entry into sexual union is postponed or exit from marriage is advanced due to divorce, separation or death of a spouse. Further, assuming that there is no child-bearing outside marriage, if some proportion of women do not at all enter marriage, the overall fertility is reduced. In India, marriage continues to be both early and nearly universal, although there is some evidence that in metropolitan cities, the proportion of single women in the age group 40-44 may be going up. However, less than 1 per cent of urban women aged 40-44 were reported as single in 1991. On the other hand, age at marriage has been steadily going up for both women and men; for women it has gone up from 16 years in 1961 to 19 years in 1991, or by about one year in a decade.⁵

In a vast country such as India, there are significant interstate variations in the mean

age at marriage. Although throughout the country, marriage for women has tended to be nearly universal, the age of entry into marriage has varied a great deal. Among the major states, the difference between the highest estimate of mean age at marriage of women for Kerala (23.9 years) and the lowest for Rajasthan (17.6 years) was a little over six years according to the 1991 Census data. The proportion of women reported as single in the age group 15-19 was 88.5 per cent in Kerala; it was barely half of that (43.8 per cent) in Rajasthan. In the next age group of 20-24 years, the proportion of women reported as single in Kerala and Rajasthan was 43.4 and 5.8 per cent.

Like most demographic surveys, NFHS has also collected information on the marital status of the sample population for the major states of India. On the basis of the age-specific distribution of women by marital status, singulate mean age at marriage has been estimated for the states. At the time of the tabulation of the NFHS data, the comparable estimates based on the 1991 census were not available. Since the publication of the NFHS data, they have become available and are presented along with the 1981 estimates and those based on the NFHS data, in Table 2. The estimates confirm the upward trend in the mean age at marriage throughout the country.

(b) *Use of contraception*: The major determinant of fertility in modern times in most countries would be the use of contraception to regulate fertility. India has officially accepted a nationwide family planning programme since 1952, but the use of contraceptives did not spread widely for nearly two decades. The programme has, since the late 1960s, been collecting statistics on the distribution and acceptance of four methods provided by the pro-

gramme (condoms, IUD, oral pills and sterilisation) and has been converting them into couple protection rates (CPR-SS) on a yearly basis for all the major states of India.⁶ In India, the couple protection rate has risen from about 13 per cent in 1970 to close to 45 per cent in the mid-1990s. However, we also have three nationwide surveys conducted in 1970, 1980 and 1989, by the Operations Research Group, Baroda⁷ and the NFHS survey of 1992-93, which have provided estimates of method-specific contraceptive prevalence rates for the major states. Compared to the official statistics, the contraceptive prevalence rates based on the more recent surveys have indicated lower use of reversible methods and point to exaggeration or over-reporting in the official statistics.⁸

There is, no doubt, that the use of contraception to lower marital fertility has gone up throughout the country, although regional differences persist. According to the NFHS data, among the major states, contraceptive use ranged between a low of 20 per cent in the largest state of India, Uttar Pradesh, and a high of 63 per cent in the southern state of Kerala. However, in the country as a whole, sterilisation, mostly of females but to a small extent of males also, accounted for 75 per cent of all methods and 85 per cent of all modern methods in use. The trend has been similar throughout the country. The reliance on sterilisation is almost as high in Kerala as in the rest of the country. The only exceptions are the north-eastern states of Assam and Tripura, where close to half of contraceptive users reported using traditional methods such as rhythm. Nearly half of the Kerala couples had resorted to sterilisation. Further, for the majority of the users, sterilisation was the first and the last method of contraception; according to the NFHS 82 per cent of women had

TABLE 1: CHANGES IN TOTAL FERTILITY RATE IN MAJOR STATES OF INDIA

State	Total Fertility Rate			Per Cent Change		
	1970-72	1980-82	1990-92	1971-81	1981-91	1971-91
All India	5.2	4.5	3.7	13.5	17.8	28.8
Andhra Pradesh	4.7	3.9	3.0	17.0	23.1	36.2
Assam	5.5	4.1	3.4	25.5	17.1	38.2
Bihar	-	5.7	4.6	-	19.3	-
Gujarat	5.7	4.4	3.2	22.8	27.3	43.9
Haryana	6.4	5.0	3.9	21.9	22.0	39.1
Karnataka	4.4	3.6	3.1	18.2	13.9	29.5
Kerala	4.1	2.9	1.8	29.3	37.9	56.1
Madhya Pradesh	5.7	5.2	4.6	8.8	11.5	19.3
Maharashtra	4.5	3.7	3.0	17.8	18.9	33.3
Orissa	4.8	4.2	3.3	12.5	21.4	31.2
Punjab	5.3	4.0	3.1	24.5	22.5	41.5
Rajasthan	6.3	5.4	4.5	14.3	16.7	28.6
Tamil Nadu	3.9	3.4	2.2	12.8	35.3	41.0
Uttar Pradesh	6.7	5.8	5.2	13.4	10.3	22.4
West Bengal	-	4.2	3.2	-	23.8	-

not used any other method of contraception before accepting sterilisation. While the use-effectiveness of sterilisation is higher than that of other methods and certainly much higher than that of traditional methods, contraceptive use cannot increase very rapidly because couples adopt it only when they are ready to limit their family size.

(c) *Duration of breastfeeding and length of postpartum amenorrhoea*: It is reasonably well established that breastfeeding is the principal determinant of postpartum amenorrhoea and with the increase in the duration of breastfeeding, the duration of amenorrhoea rises. In order to estimate the effect of amenorrhoea on fertility, information on the duration of breastfeeding is essential. Although breastfeeding in India is known to be almost universal and prolonged, until recently very few surveys had collected information on the duration of breastfeeding and the associated postpartum amenorrhoea. According to the recent SRS data for 1990-92, the average birth intervals in India continue to be rather long, with more than 60 per cent of all second and higher order births reporting an interval of 24 months or more and only less than 5 per cent of the births occurring within 10 to 12 months of the previous birth [Gol 1993b: 25-26].

Jain and Adlakha (1982: 589-606) reviewed the data available from a few surveys conducted in the 1970s and concluded that the average duration of breastfeeding had declined by about two months from 22 months in the early 1970s to 20 months in the late 1970s. In a survey of four districts undertaken in Gujarat in 1989, the estimated mean duration of breastfeeding ranged between 21 and 26 months [Visaria et al 1995: 156]. It is often said that compared to rural women, urban women tend to breastfeed their children for a shorter duration, and the Gujarat data do confirm that the urban women tended to breastfeed their children for a shorter period (by two to three months) than rural women. The studies compiled by Jain and Adlakha did not conclusively support the existence of such rural-urban differentials in the 1970s. The size of the samples of some of the studies was perhaps not large enough to derive stable estimates for rural and urban areas separately.

The NFHS asked a set of questions to women who had children less than four years old which enabled them to derive estimates of median or mean duration of breastfeeding. For the country as a whole, the mean and median duration of breastfeeding was estimated at 26 and 24 months, respectively. However, there were

significant interstate differences in the mean duration of breastfeeding, which ranged from a low of 17 months in Tamil Nadu to 33 months in West Bengal. In the eastern region of the country, women tended to breastfeed their children for a somewhat longer duration than women in most other major states of the country. (See International Institute for Population Sciences, 1995; and NFHS 1992-93, p 279.)

Admittedly, breastfeeding of this long duration does not protect women from conception for the entire duration, partly because women do not exclusively breastfeed the children when they are a little older but supplement breast-milk with other feeds. The NFHS has estimated that in India, the median duration of postpartum amenorrhoea is nine months with a sizeable interstate variation. However, the period of lactational or postpartum amenorrhoea tends to overlap with that of abstinence from sexual relations between spouses. Throughout the country childbirth is almost always followed by several months of abstinence and its duration, which is ritually determined, does not vary a great deal. The NFHS has estimated the overlap between postpartum amenorrhoea and abstinence and derived the duration of net postpartum non-susceptibility for the country as a whole as well as for the major states. For all India, the median duration of net non-susceptibility to conception was estimated to be 10 months.

The NFHS does not take into account the likely overlap between the postpartum amenorrhoea and the use of modern methods of contraception, other than abstinence, because some women do start using contraception prior to resumption of

their menstruation. For example, health workers do encourage women to accept an IUD, within a few months of childbirth. When women have attained the desired number of children, a permanent method like tubectomy is also promoted and accepted a few days after delivery. To estimate accurately the net duration of postpartum infecundability, the overlap between postpartum amenorrhoea and abstinence as well as the use of other contraceptives needs to be estimated. However, in a survey of four districts of Gujarat, the overlap between postpartum amenorrhoea and use of contraception varied only between 1.7 and 2.6 months [Visaria et al 1995: 156].

(d) *Abortion*: The extent to which women resort to abortion has a direct effect on

TABLE 3: TOTAL FERTILITY RATE, MARITAL FERTILITY RATE AND INDEX OF MARRIAGE FOR MAJOR STATES OF INDIA, 1992-93

State	Total Fertility Rate	Marital Fertility Rate	Index of Marriage C(m)
All-India	3.49	4.77	0.711
Andhra Pradesh	2.59	3.50	0.740

Orissa	18.9	19.9	19.1	20.3	21.8	20.5	20.4	21.8	20.7
Punjab	NA	NA	21.1	21.1	21.4	21.2	20.9	21.7	21.1
Rajasthan	15.8	18.0	16.3	17.1	19.2	17.6	17.9	20.5	18.4
Tamil Nadu	19.9	20.9	20.3	20.8	22.1	21.3	20.0	21.3	20.5
Uttar Pradesh	16.2	19.4	16.8	17.7	20.6	18.4	17.9	20.9	18.6
West Bengal	18.5	21.4	19.3	19.2	22.8	20.2	18.1	21.8	19.2

Note: In 1981, Punjab and Haryana constituted one state and although state level estimates of mean age at marriage for these states have been made, those for rural and urban areas are not made.

Sources: Goyal (1988, 97-119); 1981 and 1991 Census; and NFHS 1992-93.

fertility levels, independent of other proximate determinants, because abortion ends a pregnancy. Abortion may be spontaneous or deliberately induced to end an unwanted pregnancy or malformed pregnancy, which may be life-threatening, or to end a pregnancy with a focus of the wrong sex. The extent of spontaneous abortions in a population may depend on the nutritional status of women or maternal health. However, induced abortions depend upon the cultural, religious and societal norms and attitudes as well as on the legal status of abortion in the country. In India, induced abortion has been legal since 1972 and yet there are no firm estimates of the number of such abortions performed in the country. The lack of information stems from the fact that, besides the governmental facilities, many women use private facilities for abortions. Abortions in these facilities are often performed by unqualified health practitioners and are rarely recorded.

In the early 1990s, a study undertaken to understand the extent to which women resorted to abortion in the country, estimated that 11 million abortions occurred in India annually, of which 60 per cent were probably induced and the remaining were spontaneous [Chabra and Nuna 1993: 17-27]. While collecting information on pregnancy history of women, questions on both spontaneous and induced abortions are invariably asked in many surveys. However, it is widely held that the incidence of induced abortion is grossly under-reported in the surveys for a complex set of reasons. There is still a stigma attached to reporting induced abortion. Women or couples often do not inform their immediate relatives about having resorted to abortion and are unlikely to report it to the investigators. Sometimes induced abortions are reported as spontaneous abortions. Even if the reference period of the survey requires women to recollect the outcomes of all pregnancies since marriage until the time of the survey, some events, which do not result in livebirths, are omitted. In the four-district Gujarat study, while 9 to 15 per cent of all women who were interviewed, reported having experienced a spontaneous abortion, only about 1 to 2 per cent reported an induced abortion. The total abortion rate worked out from the reported occurrences ranged between 0.1 and 0.2 per woman, with large rural-urban differences within the districts [Visaria et al 1995: 153].

The NFHS collected information on outcomes of all lifetime pregnancies from

all ever-married women in the survey and noted that women reported 4.5 and 1.3 per cent of all pregnancies as having ended in spontaneous and induced abortions, respectively. The NFHS report admits that the information collected on abortions is likely to be less accurate than on livebirths. In spite of the possibility that the incidence of induced abortion in India is on the increase, its estimates tend to be very low so that the effect of this factor on total fertility is also estimated to be very small.

III Estimation of Proximate Determinants of Fertility

While Bongaarts's analytical framework lends itself well to measuring the impact of proximate determinants of regulated fertility, either over time or between sub-

populations within a region, to understand their individual contribution, data on all these factors were not readily collected in one survey until recently. Pooling information from different surveys poses problems of comparison in terms of sampling design, reference period and geographical coverage of surveys. In India, for the first time, data on marriage, use of contraception, duration of breastfeeding and length of postpartum amenorrhoea and outcome of pregnancies are available from one source – the 1992-93 National Family Health Survey (NFHS). These data enable us to estimate the values of proximate determinants of fertility for all the major states. The state samples of the NFHS were based on the population size of the states and ranged between 2,766 respondent women in Jammu and Kashmir

TABLE 4: CONTRACEPTIVE USE RATE BY METHOD AND INDEX OF CONTRACEPTION FOR MAJOR STATES OF INDIA, 1992-93

State	Contraceptive Use by Method				Contraceptive Prevalence Rate	UI	Index of Contraception C(c)
	Sterilisation	IUD	Oral Pills	Other Methods

Notes: Data are collected from mothers of children born during the three years preceding the survey.

Medians are based on current status.

Non-susceptible is defined as amenorrhoeic or abstaining or both.

and 11,438 in Uttar Pradesh.⁹ With such a sample size, it was possible to derive reasonably stable state level estimates of the contribution of proximate determinants which would help understand the transition from natural to controlled fertility in the 15 major states of the country. (Jammu and Kashmir is not included in this analysis because NFHS was conducted only in the Jammu region and the 1991 Census was not conducted in Jammu and Kashmir.)

(a) *Index of marriage*: The index of marriage $C(m)$ is estimated from the information on total fertility rates (TFR) and total marital fertility rates (TMFR) as reported by the NFHS. These rates are based on the births during the three-year period of 1990-92 before the year of the survey. The index of marriage is estimated as $TFR/TMFR$. The values for the major states of India are shown in Table 3. The value of $C(m)$ measures the effect of age at marriage on fertility and increases with an increase in the age at marriage. In other words, $C(m)$ expresses the effect of non-marriage in terms of a reduction in fertility per woman. As is evident, the interstate variations in TFR ranged between a low of 2.0 for Kerala to more than twice that level of 4.8 for Uttar Pradesh. The total marital fertility ranged between a low value of 3.5 for Andhra Pradesh to 6.0 for Uttar Pradesh.¹⁰

(b) *Index of contraception*: The index of contraception $C(c)$ is estimated from the information on method-specific contraceptive prevalence rates and use effectiveness of various methods. These data are converted into an equation: $C(c) = 1 - 1.08ue$, where u is the contraceptive prevalence and e is the average effectiveness. The value of e is a weighted average, with method-specific prevalence rates as weights. The average effectiveness is assumed to be 1.0 for sterilisation, 0.95 for IUD, 0.90 for oral pills and 0.7 for all other methods, including condoms. The method-specific contraceptive use rates, the average effectiveness and the estimated index of contraception are given in Table 4. The value of $C(c)$ measures the fertility-inhibiting effect of contraceptive use. A high value of $C(c)$ is associated with low use of contraception. If contraceptive practice were absent or completely inefficient, $C(c)$ would be 1.0. Among the states, as one would expect, the estimated $C(c)$ ranges between a high of 0.80 in Uttar Pradesh and a low of 0.36 in Kerala.

(c) *Index of postpartum infecundability*: The index of postpartum infecundability $C(i)$ is derived from the estimates of postpartum amenorrhoea (i) and by using a relationship, where $C(i) = 20/(18.5 + i)$.

Duration of postpartum infecundability is estimated on the basis of responses to a set of questions asked of women who gave birth(s) during the three-year period preceding the survey. The questions related to current postpartum amenorrhoea, if any, and the number of months without menstruation after each childbirth that occurred

in the last three years. Women were also asked about the duration of abstinence from sexual intercourse after childbirth and about the length of breastfeeding of each child born in the past three years. These data have been used to estimate the gross duration of postpartum infecundability, the overlap between postpartum

TABLE 6: VALUES OF SELECTED FERTILITY INDICES FOR MAJOR STATES OF INDIA, 1992-93

State	TFR	$C(m)$	$C(c)$	$C(a)$	$C(i)$	TF
All India	3.39	0.711	0.584	0.991	0.697	11.8
Andhra Pradesh	2.59	0.740	0.492	0.995	0.699	10.2
Assam	3.53	0.608	0.643	0.982	0.680	13.5
Bihar	4.00	0.818	0.755	0.998	0.687	9.5
Gujarat	2.99	0.589	0.490	0.995	0.717	14.5
Haryana	3.99	0.763	0.500	0.990	0.730	14.5
Karnataka	2.85	0.636	0.500	0.993	0.702	12.8
Kerala	2.00	0.485	0.355	0.989	0.775	15.2
Madhya Pradesh	3.90	0.826	0.617	0.996	0.717	10.7
Maharashtra	2.86	0.634	0.430	0.993	0.707	15.0
Orissa	2.92	0.638	0.617	0.995	0.699	10.7
Punjab	2.92	0.529	0.423	0.988	0.873	15.1
Rajasthan	3.63	0.767	0.665	0.994	0.738	9.7
Tamil Nadu	2.48	0.569	0.484	0.971	0.719	12.9
Uttar Pradesh	4.82	0.802	0.802	0.995	0.714	10.5
West Bengal	2.92	0.679	0.453	0.994	0.702	13.6

Notes: $C(m)$ = Index of marriage
 $C(c)$ = Index of contraception
 $C(a)$ = Index of abortion
 $C(i)$ = Index of postpartum infecundability
 $C(t)$ = Total fecundity rate
 $C(m) = TFR/TM$
 $C(c) * C(a) = TM/TN$
 $C(i) = TN/TF$
 where TFR is total fertility rate, TM is total marital fertility rate, TN is total natural marital fertility rate and TF is total fecundity rate
 These can be rearranged as:
 $TFR = C(m) * TM$
 $TM = C(c) * C(a) * TN$
 $TN = C(i) * TF$
 Further simplified, they can be expressed as: $TFR = C(m) * C(c) * C(a) * C(i) * TF$
 $TM = C(c) * C(a) * C(i) * TF$
 $TN = C(i) * TF$

Source: Estimation procedures are based on Bongaarts and Potter (1983, 78-87)

 TF : Total fecundity rate

FIGURE: ESTIMATED AVERAGE TOTAL FECUNDITY RATES (TF), TOTAL NATURAL MARITAL FERTILITY RATE (TN), TOTAL MARITAL FERTILITY RATES (TM), AND TOTAL FERTILITY RATES (TFR) FOR MAJOR STATES OF INDIA, 1992-93

infecundability and abstinence, and the net duration of postpartum infecundability. The estimates of these measures and the index of postpartum infecundability are shown in Table 5.

The effect of postpartum infecundability operates on fertility through changes in birth interval. Bongaarts has estimated that if no breastfeeding and postpartum abstinence are practised, the birth interval averages about 20 months. This is the sum of 1.5 months of minimum postpartum anovulation, 7.5 months of waiting time to conception, 2 months of time added by spontaneous intrauterine mortality, and 9 months for a full-term pregnancy. The index $C(i)$ is thus estimated as $20/18.5 + i$. Among the states, the estimate of $C(i)$ ranged from a high of 0.87 in Punjab to a low of 0.68 in Assam.

(d) *Index of abortion*: The index of abortion $C(a)$ is estimated from the reported lifetime experience of induced abortions, contraceptive use (u) and total fertility rate (TFR) using the equation:

$$C(a) = TFR / (TFR + 0.4(1 + u)TA)$$

Data to estimate the total abortion rate (TA), which is equal to the average number of induced abortions per woman at the end of the reproductive period if induced abortion rates remain at prevailing levels throughout the reproductive period, are not available in the NFHS. Therefore, information on the outcome of all lifetime pregnancies is used to derive approximate estimates of total abortion rate. TA is calculated by multiplying the total fertility rate by the proportion of induced abortions among all live births. The estimates of the index of abortion for all the states are also given in Table 5. As is evident in the table

the values of $C(a)$ in all the states with the sole exception of Tamil Nadu are greater than 0.98. We have therefore not considered the insignificant fertility inhibiting effect of abortion in the model discussed here.

Table 6 gives the values of the indices of the four proximate determinants and the estimates of the total fecundity rates implied by these determinants. The data are graphically depicted in the Figure in terms of fertility inhibiting effects of the proximate determinants for each of the major states of India. The structure of the Figure suggests that if the effect of delayed marriage is removed without any other change in fertility behaviour, fertility level will increase to total marital fertility rate (TM). If the practice of contraception and induced abortion are also eliminated, the fertility will rise to a level of the total natural marital fertility rate (TN). In addition, if women do not breastfeed their children and do not practise postpartum abstinence, the fertility will increase to the total fecundity rate (TF). Fertility is below its maximum value because of delayed marriage, use of contraception, induced abortion and postpartum infecundability induced by breastfeeding and abstinence.

IV Findings and Discussion

Bongaarts has empirically shown that the TF values range between 13 and 17 births per woman with an average near 15 and has suggested that values outside this range are very likely due to some errors in data or estimation procedures.¹¹ For India as a whole, the total fecundity rate was estimated to be 11.8 births, which is

lower than the average of 15.3 by a little over three births. According to the district level Gujarat study cited earlier, the estimated TF values for all the four districts were also lower than 15.3 and ranged between 10.9 and 13.4 births [Visaria et al 1995:146]. While the estimates for nine of the 15 states (Gujarat, Haryana, Kerala, Maharashtra, Punjab, Assam, Tamil Nadu, West Bengal and Karnataka) fall within the range of 13 and 15, the TF values of the remaining 6 states are lower than 12.5 (Table 6). The estimated total fecundity rate in all the four large north Indian states and Orissa and Andhra Pradesh is less than 11 births. The quality of data used to derive the various estimates of proximate determinants needs to be closely scrutinised to understand the extent of errors in the survey in the reporting of age at marriage, duration of breastfeeding, onset of menstruation, etc.

However, the possibility that the natural fecundability of Indian women is lower also needs to be explored. It is sometimes alleged that lower nutrition and higher secondary sterility along with cultural and religious practices leading to a lowering of coital frequency may result in lower fecundability of women in cultures like that of India. In an analysis using various sources, including the ORG and the NFHS data, Jain estimated a value of TF around 13 births for the early 1970s and surmised that a lower value of TF for India is quite plausible because of terminal abstinence, low frequency of intercourse, malnutrition and seasonal migration of men in search of work [Jain 1996]. Some qualitative inquiries do support the view that frequency of intercourse among Indian couples is significantly reduced or even permanently terminated once a son is married and a daughter-in-law is present in the house, even if the woman is still in her early forties. The issue needs more data based exploration. Similarly, separation of spouses on account of migration of men for work would lower the risk of pregnancy and increase the inter-birth intervals even in the absence of use of contraception. More research is needed to fully explore the effect of short-term migration on fertility.

The figure provides some insights into how the proximate determinant model operates. (The values are shown in Table 7.) The major states are arranged according to the estimated value of TF or total fecundity rate. It is evident that the transition from natural to controlled fertility in states such as Kerala, Punjab and Tamil Nadu is accompanied by a large increase in the use of contraception. The contri-

bution of use of contraception to depressing the total fecundity was between 1.5 and 2.5 births in Bihar, Rajasthan, Uttar Pradesh; it was above 7 births in the case of Kerala and Punjab and 6 in the case of Maharashtra. In spite of the fact that the TF estimates for Bihar and Uttar Pradesh are lower than those of Punjab and Kerala, contraception depressed TF by less than 20 per cent in Bihar and Uttar Pradesh but by more than 50 per cent in Punjab and Kerala. (The contraceptive prevalence rate ranged between 20 in Uttar Pradesh and 23 in Bihar and 63 and 59 in Kerala and Punjab, respectively.)

The effect of a decline in the proportions married on the total fecundity or the fertility inhibiting influence of delayed marriage on total fecundity is much less than that of contraception. It ranged between 0.8 births in Madhya Pradesh and 2.6 births in Punjab and did not show a uniform pattern. The estimated value of $C(m)$ or the index of marriage in the states of Madhya Pradesh, Bihar and Uttar Pradesh was above 0.8. At the other end of the spectrum, in the states of Tamil Nadu, Punjab and Kerala, $C(m)$ ranged between 0.57 and 0.48, suggesting that the fertility inhibiting influence of late marriage on TF was relatively high. The states of Gujarat and Assam, with a relatively higher mean age at marriage were also in the latter category of states. However, even in the states with low values of the index of marriage, marriage continues to be universal.¹² The low value of $C(m)$ in states like Kerala, Punjab and Tamil Nadu is largely due to a relatively high mean age at marriage. In the four large north Indian states and in Andhra Pradesh, the age at marriage is lower than the national average. With an increase in urbanisation, spread of education and some of the other urban values through mass media, we can expect the age at marriage of women in these states to go up in the near future. In the more industrialised and urbanised states, some women may also choose a career over marriage and thus decrease the proportion of the married. However, such changes tend to be slow.

Transition from natural to controlled fertility is typically accompanied by a shortening of postpartum infecundability. Women tend to breastfeed infants for shorter duration and resort to using contraception to control fertility. The estimated duration of postpartum infecundability ranged between the high values of 10.6 and 10.9 months in Assam and Bihar and the low value of 4.4 months in Punjab. This factor depressed total fecundity by just about 2 births in Punjab

but close to 6 births in Maharashtra. In Punjab, the limited effect of postpartum infecundability on total fecundity is compensated by greater use of contraception. The relatively large role of this factor in depressing total fecundity implies that there is considerable scope or potential for fertility to increase in states such as Maharashtra, Gujarat and West Bengal if the infant feeding practices change. There is some evidence that the duration of breastfeeding in urban areas is somewhat shorter than in the rural areas. It is possible that the urban influence may spread to rural areas and rural women may also shorten the duration of breastfeeding their babies. If such a decline in the breastfeeding is not accompanied by an increase in the use of contraception, fertility can go up. Also, with a reduction in postpartum infecundability, inter-birth intervals can become shorter, unless there are compensating increases in the use of reversible methods of contraception.

Further, there are indications that the desired fertility is close to or below the replacement level in many parts of the country, including in the areas where the actual fertility is still relatively high. This implies that for attaining or realising that desired goal, couples will have to practise reversible methods of contraception or lower the age at sterilisation. The NFHS data indicate that the median age of women at the time of sterilisation was 27 years. Among those who were sterilised during the two years preceding the survey, the median age was 26.3 years. In states like Tamil Nadu, Maharashtra, Karnataka, Andhra Pradesh, the median age of women, who were sterilised two years prior to the survey, was less than 25 at the time of sterilisation. The implications of such a process or trend need to be fully explored.

Another factor not fully explored in demographic literature relates to the pathways through which India can attain the demographic goal of attaining the net reproduction rate of unity as early as possible. It is argued that significant changes will be required in socio-economic conditions to achieve this goal. However, these changes have to operate through fertility inhibiting processes such as increase in the mean age at marriage or in the proportion of women choosing permanent spinsterhood and in the control of marital fertility through the use of contraception or induced abortion. A countervailing fertility-enhancing factor would be a reduction in the duration of breastfeeding and the consequent shortening of the length of postpartum amenorrhoea. Admittedly, not all these

processes are easily amenable to direct or indirect policy interventions. If, in spite of some increase in the mean age of marriage, marriage continues to remain universal in India, what would be the contraceptive prevalence level required to attain the net reproduction rate of one? If the urban and modern influences contribute to enhancing fertility to a certain extent by reducing the mean duration of breastfeeding, what would be the contraceptive use required to reach the replacement level of fertility?

According to some rough estimates, if we assume no change in the value of all the proximate determinants except for the use of contraception, the TFR of 2.1 or the replacement level can be achieved with rate of contraceptive use rate of 65 to 70 per cent at all India level. It would be very difficult to achieve this level of contraceptive use with major emphasis on sterilisation as a method. However, according to the NFHS data, sterilisation is the most used method of contraception throughout India, accounting for 76 per cent of the current contraceptive prevalence. Modern reversible methods, which accounted for less than 14 per cent of the current use of contraception, would have to be promoted in a big way to hasten the pace of fertility decline.

In order to promote the use of family planning, we have to address the issue of strong son preference with its roots in social mores and which contributes to raising wanted fertility and leads to some unwanted fertility. Measures to weaken the preference for sons include improving the status of women through education and employment.¹³ There are very few direct policy interventions to enhance women's autonomy, and improve their bargaining or negotiating capacity within the household, except education which is sensitive to women's needs and which is provided to both boys and girls from early ages. Equally important is lowering of infant and child mortality. Strong policy intervention on this front would not only enhance the credibility of the health personnel and the government among the people, but would also raise the acceptance of the family planning programme among those who are hesitant to do so. A lower infant and child mortality will help reduce the wanted fertility insofar as the couples try to replace the deceased children and also seek to 'insure' against the loss of children, which often occurs when couple can no longer replace the lost children.

The policy options to raise the age at marriage are limited to influencing the enrolment and continuation of girls in

schools until the age of 14 or so, and an educational campaign to convey the advantages of late age at marriage (and avoiding teenage pregnancies). However, in spite of the rhetoric about universalisation of schooling up to the age of 14, the issue of schooling of girls is closely linked to the availability of schools within the small villages. Parents are often reluctant to send their young daughters to schools in the nearby villages because they fear for their safety. This is a larger social issue resulting from the socio-political climate prevailing in many parts of the country, which cannot be easily tackled by campaigning for education for girl children. Viable, acceptable and high quality alternatives to formal schooling need to be thought about and promoted.

Overall, in the wake of indications from the data available from the Sample Registration System and the NFHS of a faster than expected decline in fertility and the removal of quantitative method-specific family planning targets, the Indian policy-makers must now show flexibility in addressing the needs of the population. The state-specific trends, constraints, and socio-economic-political situation require region-specific policies and programmes especially in states (and districts), which have lagged behind and need to be helped to catch up with the rest of the country.

Notes

[This is an extensively revised version of the paper presented at the seminar on Comparative Perspectives on Fertility Transition in South Asia, organised by the IUSSP Committee on Fertility and Family Planning and held at Islamabad, Pakistan, during December 1996.]

- 1 In some regions of India, the SRS took a little longer to fully establish itself so that estimates of vital rates are either not available for or are underestimated in the initial years. In such cases, an unusual upward swing in vital rates is noted over time implying lower than the true level of decline. Notwithstanding some of these problems, the overall quality of the SRS data is considered quite robust to infer regional patterns and time trends.
- 2 The total fertility rate or the TFR shows the average number of children expected to be born to a cohort of women if at successive ages during their reproductive period, they bear children at the same rate as was observed during a specified period. While calculating the TFR, no allowance is made for any mortality and equal weights are assigned to successive five-year age groups. A crude birth rate, on the other hand, is a weighted average of the age specific fertility rates, with weights based on the age distribution of the population. As a result, the TFR shows a faster decline in fertility than the crude birth

rate of the population.

- 3 The 1994 revision of the UN population projections places the medium and low variants of TFR during 1990-95 at 3.75 and 3.66, respectively. According to the medium variant of the projection, which is recommended for general use, a TFR of 2.10 is expected to be reached during 2015-20. The low variant projects a TFR of 2.01 during 2010-15 and 1.60 during 2015-20. The latter appears an unlikely scenario.
- 4 Rural fertility continues to be higher than urban fertility in all the states. Uttar Pradesh reported the highest rural TFR of 5.5 and the other three large north Indian states reported TFR between 4.9-5.0 during 1990-92. At the other extreme were the two southern states of Kerala and Tamil Nadu, with a rural TFR of 1.9 and 2.5, respectively.
- 5 These are census-based estimates of mean age at marriage, known as singulate mean at marriage. The estimates refer to an average number of years a person remains single under the assumption that age specific marriage patterns remain unchanged in the 10 year period prior to the decennial census [Agarwala nd and Goyal 1988].
- 6 Although the basis of estimating couple protection rates in the official service statistics, for oral pills and condoms is their distribution, for IUD is the reported insertions, and for sterilisation it is the number of procedures performed, these rates are quite different from contraceptive prevalence rates, which are derived on the basis of the responses obtained from the users directly. The two estimates are generally treated as similar.
- 7 The findings of these three surveys are available in: Operations Research Group, *Family Planning Practices in India: The first All India Survey Report* (not dated), *The Second All India Survey Report* (1983), and *The Third All India Survey Report* (1990) Baroda.
- 8 The nature of discrepancies is discussed at some length, on the basis of empirical data, in Visaria et al (1994:293-303).
- 9 The targeted sample for each of the six small north-eastern states was smaller (around 1000 women) than for the other large states. The results of these were pooled to represent the entire north-eastern region.
- 10 The figure of low total marital fertility in Andhra Pradesh is somewhat puzzling. The incidence of childlessness as well as the percentage of menopausal women in thirties in Andhra Pradesh is the highest in the country: in the age group 30-34, the proportion of menopausal women was 8 per cent in Andhra Pradesh as opposed to 3 per cent for the country as a whole and in the age group of 35-39, it was 15 per cent as opposed to 7 per cent for India. More exploration of NFHS data as well as more studies is needed to understand the factors explaining these reported phenomena.
- 11 The total fecundity rate does not vary much because the other proximate determinants of fertility - natural infecundity, spontaneous intrauterine mortality and permanent sterility

- which also influence fecundity cause only modest changes in fertility and differ very little between populations.

- 12 The institution of arranged marriages facilitates universal marriage. The proportion of population remaining single (never-married) beyond age 50 tends to be extremely small (less than 1 per cent among women and just about 1 per cent among men).
- 13 These and other policy issues are discussed in Visaria and Visaria (1996).

Economic Condition and Fertility

Is There a Relationship?

T K Roy
V Jayachandran
Sushanta K Banerjee

The standard of living or economic status data are not always sufficient to understand the complex mechanism of fertility change. A number of other social factors directly and indirectly influence couples' decisions on family size. Statewise analysis of data shows that only in Punjab is there the expected negative association between living standard and fertility change.

IT is difficult to establish any economic theory of fertility which is really universal. This is more obvious for a country like India because of its unique regional economic diversity which can influence fertility transition. The relationship between economic condition and fertility thus remains at best unclear. Once children can be regarded as a special type of commodity, in the economic parlance, a feasible relationship between income and fertility is not difficult to visualise. A rise in income is likely to be associated with higher fertility. The rationale behind this positive income-fertility relationship is that, holding everything else constant, higher income implies greater resources available to support a large family, and if children are assumed to be consumer durables with a positive income elasticity, higher income will lead to the consumption of more children [Becker 1960]. Early research on the subject suggested such a possibility [for example, see Glass 1968; Stys 1957; Driver 1963; UN 1961]. But the value or utility of children has not been invariant over time and space. With a rise in income, a greater concern for the quality of children rather than their quantity may become the dominant concern. And since quality children usually require greater investment than return, a rise in income might lead to reduction in fertility. In fact, a majority of the later studies tend to support this negative association [for example see Easterlin 1975; Bulatao and Lee 1983; Registrar General 1979]. However, in some cases, this negative relationship is interrupted at the top end of the economic scale, that is, couples with very high incomes have a larger fertility than those with high incomes [Bernhardt 1972]. Undoubtedly, how children are valued in a society will be a dominant determinant of the fertility desire of the couples.¹ The form of the utility function, as indicated by Becker who propounded the positive relationship, is determined by tastes which in turn depend on social characteristics like education, religion, ethnicity etc. [Becker 1960].

Thus the economic ends are largely determined by the socio-cultural ends of a society [Caldwell 1977].

However, many of the empirical findings relating to the association between fertility and economic condition, are often criticised because of their flexible methodology. What is more important is the ambiguity in defining the true economic status of a household. Two issues have particular relevance in the investigation of the relationship. The first one is the extent to which the economic status is linked with size of landholding. If economic status is highly linked with the size of landholding and land holding, in general, is operational holding, the overall relation between land and fertility is likely to be positive. A farm family working on larger holding will find additional family labour beneficial through the complementarity of child labour and land holdings [land labour demand hypothesis; Cain 1985]. However, if the holdings are owned and not rented, the relationship may turn out to be negative. In this case, the substitution of land for children on the ground of old age security will lead to a decline in fertility (land security hypothesis).

The other issue is the extent and type of participation in labour force by females. In general, working women are found to have lower fertility. However, this negative work-fertility relationship depends largely on the type of work opportunities available for women. Both the incompatibility of women's role as mothers and workers and the opportunity cost of children are likely to be high if women are engaged in non-familial occupations. The negative work-fertility relationship is likely to depend on the level of education of women. The relationship will tend to be much higher among better educated group of women because of higher opportunity cost.

The pure economic framework evolved by Becker for fertility analysis has no doubt opened new room in the field of demographic research. However, in the

Indian context, studies on the subject are few. This paper attempts to explore the economic rationality of fertility preferences in India. An attempt has been made to examine the linkage separately among couples with varying levels of education, with the supposition that a stronger negative association between economic condition and fertility will emerge among the more educated couples. Data generated by the large-scale National Family Health Survey (NFHS) provide an excellent opportunity to undertake such a study [IPS 1995].

THE SETTING

An important question is what would be the suitable parameter to explore the true economic status of a household. In the literature the economic condition is variously derived either by income and expenditure or by material possessions and standard of living. Compared to income, either expenditure or standard of living is more likely to be influenced by the prevailing modern behaviour and cultural practices. A high standard of living generally means a higher level of income as well as a favourable disposition towards acquiring other commodities that add to one's comfort. More than income, the other two indicators will, therefore, be more relevant in the context of examining the linkage between economic condition and fertility. At the same time, the use of 'current income' in the empirical studies has several limitations. According to Easterlin (1969), in relation to fertility preference, current income is a very poor proxy for economic status, since when parents make decisions about the desired family size, they have in mind not current but the expected or potential income and reliable information on expected or potential income is not possible to collect in a household survey. To avoid this complexity and yet to get a reasonably good approximation to economic status, this study has decided to ascertain the living standard of the household where a woman

lived through an index termed as standard of living index (SLI). It incorporates information regarding household amenities which includes type of house, availability of electricity, source of drinking water, nature of toilet facility, and possession of livestock and consumer durable goods. Finally, a summary index has been derived on the basis of accessibility of these items by assigning weights to each item according to its economic values and importance (see Appendix Table). Although this crude index has its limitation because of some arbitrariness in assigning weights to each item, we are satisfied that it has distinguished households from high to low standard of living, which is the prime purpose of this study.

The other two variables, possession of land and occupation of women, which are relevant in deciding the economic condition have been dealt with separately. In this respect, a household is categorised into three groups on the basis of amount of land it possessed (in this case it refers to the land owned by a household) as land less, with 1-4 acres of land and with five or more acres of land. Since the major purpose is to analyse fertility behaviour, the occupation of a woman is categorised as either working for someone else or not working (which includes those working in family farm/business). As indicated earlier, the relationship between economic condition and fertility has been examined considering two groups of couples, (i) couples with a higher level of education, that is, couples with both husband and wife educated at least upto middle school; and (ii) couples with a low level of education, that is, those who are either illiterate or not having sufficient education (less than middle school).

Although all the major states were covered in the survey, the present investigation is restricted to only four states: Punjab, Maharashtra, Kerala and Uttar Pradesh. Among these four, Punjab is the most prosperous state in terms of economic development. The late-1960s which were marked by the period of 'green revolution' not only established a package agricultural programme (through the introduction of irrigation, high-yielding varieties, fertiliser, pesticides) but also changed the face of Punjab from a state of acute food deficit to surplus. As a consequence, living standards have been rising sharply, along with per capita income. It ranks first among all Indian states both in terms of per capita income (Rs 8,281 at current prices in 1990-91) as well as in annual per capita food production (913.2 kg in 1989-90). The present

demographic change in Punjab is expected to reflect this economic prosperity.

On the other hand, in spite of its economic stagnation Kerala has achieved a unique demographic transition. Contrary to the normal pattern, with the lowest per capita foodgrain production (36 kg in 1989-90) as well as a very low level of per capita income (Rs 3,054 at current prices 1988-89), Kerala has been the most successful state in terms of controlling demographic parameters only through social development.

Although Maharashtra is the second highest ranking state after Punjab in terms of its per capita income (Rs 5,155 at current prices 1988-89), 36.7 per cent of its rural and 17 per cent of urban population still

live below the poverty line. In terms of industrial development, Maharashtra is the most advanced state in India. Contributing 22 per cent of the nation's net value added by the manufacturing sector [CMIE 1991]. However, much of the state income is concentrated only in a few urban pockets of the state which in turn creates extreme inequality within the state [IIPS 1995].

Uttar Pradesh is the most populous state in India with a very low level of per capita income (Rs 2,698 at current prices 1988-89). Most of the state population is still engaged in agricultural activities. The four states, therefore, provide an ideal setting for a fruitful understanding of the linkages between economic condition and fertility.

TABLE 1. MEAN STANDARD OF LIVING INDEX (SLI) AND ITS COEFFICIENT OF VARIATION (CV) ACCORDING TO SELECTED BACKGROUND CHARACTERISTICS FOR SELECTED STATES

Background Characteristics	Kerala			Punjab			Maharashtra			Uttar Pradesh

Notes: 1: BO for the high-CEDU category of medium SLI includes low SLI also.

- Not enough cases to calculate the BO.

Table 1 provides some information about the economic condition of women in the four states.² The average living standard in Punjab is much higher than in the other three states. The ranks of mean level of living are: 20, 14, 13 and 12 respectively in Punjab, Kerala, Maharashtra and Uttar Pradesh. Better economic conditions in Punjab are noticeable in both urban as well as rural areas. The gap between rural and urban women is the least in Kerala and the highest in Uttar Pradesh. However, when we consider economic disparity either in rural or urban areas, the situation is better in Punjab than even in Kerala. Punjab seems to be much ahead of the other three states in having a better economic condition, both in terms of the level and its distributive aspect. Among rural areas of the four states, Maharashtra shows the lowest living standard as well as the maximum inequity. The ownership of land in rural areas, as can be expected, leads to better living condition. This is particularly visible in Kerala and Punjab. In Uttar Pradesh and Maharashtra, where landholding is much more widespread, the standard of living of women possessing 1-4 acres of land is marginally higher than that of the landless. In fact, it is surprising to note that in these two states, the living condition of households with more than five acres of land is even lower than that of the landless households in Punjab. Landless households are a heterogeneous group consisting of agricultural labourers, businessmen and those engaged in service sector. The agricultural prosperity in Punjab has not only benefitted those having land but also contributed to the rise of a wide range of agro-based and other industries which create off-farm employment opportunities for many [Das Gupta 1995]. However, the variation in the standard of living is maximum among the landless and this is true in all the four states.

Table 1 also reveals a strong relationship between education of couples and standard of living of their households, the educated couples having a much higher standard of living compared to the less educated ones. A very small proportion of women were working for someone else. This was particularly true in Uttar Pradesh and Punjab, where the per cent of women working for someone else was 3 and 6 respectively. In all the four states, the living condition of households where women were working for someone else was lower than that in households where they are not working outside. It seems that poor economic condition is the cause for women to go out and work for someone else.

TABLE 3 DESIRED FAMILY SIZE, CURRENT USERS, AND UNMET NEED FOR FAMILY PLANNING FOR WOMEN ACCORDING TO THE LIVING STANDARD AND COUPLES' EDUCATION (CEDU) FOR SELECTED STATES

Our basic interest is to find out the impact of living standard on fertility. The most important question here is: What should be the indicator of fertility? Available literature in this direction has suggested that indices of actual fertility, measures of family size preferences, and different aspects of family size decision making might be used as dependent variable [Namboodiri 1972]. Keeping this in view, two indices for actual fertility, mean number of children ever born and births of different orders per 1,000 women have been computed for women who were married for at least 10 years.³ On the other hand, in order to understand family size preferences, three different variables such as desired family size, proportion of current users of any family planning method and unmet need for family planning have been considered.

How fertility might be related to economic condition can be gauged from Table 2. According to this table, among the less educated couples in Kerala, the average parity does not decline with increase in the level of living. However, in Punjab, the average number of children among women in the 'high' category of living standard was 3.8, which is considerably lower than that among women in the lower level of living. In Maharashtra and Uttar Pradesh, though a declining trend is visible, the difference in the number of children born by level of living is not substantial. The relationship between level of living and fertility appears to be stronger among the educated couples, particularly in terms of the difference in fertility between women in the low and high categories of living. It is apparent from Table 2 that education of couple plays a more dominant role in influencing fertility than the standard of living. Also, there is an interaction between education and standard of living in affecting fertility, the effect of level of living is stronger in the educated couples compared to the less educated ones. The variation in the number of children per woman tends to be more among the low level of living, particularly for less educated couples.

Fertility as measured by births of different order per 1,000 women also suggests that among the less educated group, the decline with living condition is only marginal, except in Punjab. In Kerala, with an increase in the level of living, a greater proportion of the couples (less educated) continues with reproduction and have higher order births. For example, among the high living group, out of 1,000 women 758 have three children, and 466 have four or more children, whereas women

among the low living category, 722 and 397 women have three and four or more children. The finding seems to support the observation that the urge to adhere to the norm of having two children does not diminish with the increasing standard of living. But this is evident only among the less educated group of couples. Thus among the less educated couples, the relation between economic status and fertility might tend to be U-shaped as indicated by Bernhardt (1972). According to her, higher fertility among the highest income bracket can be observed largely because they tend to have greater uniformity in adhering to the social norm of having two children [Bernhardt 1972]. That is, a greater proportion of these women proceed to have at least 2 children. For this group, the results also tend to suggest that childlessness declines with better living condition.

As has been indicated earlier, the relationship between actual fertility with economic condition may get vitiated

because of the failure on the part of women (especially the disadvantaged group) to exercise control to achieve the desired family size. It is, therefore, pertinent to examine how the family size preferences vary with the economic condition. The ideal family size for a woman – how many children she would want in her lifetime if she could start all over again – was ascertained in the NFHS. It is true that fertility ideals of women will be influenced by their actual family size, particularly, it may be over estimated by women whose actual family size is large. The over estimation is likely to occur because the women tend to rationalise their actual fertility behaviour. To obviate this, we have examined the relationship between the ideal family size and economic condition by considering women who have two or fewer number of children and are aged less than 30 (Table 3). These women are still in the process of family building. The family size preferences of the younger women show a declining trend with a rise

1 : For Punjab other religion refers to Sikh only.

@ : Not considered separately because they are small in number. Hindus include all religious groups other than Sikhs.

@@ : Not considered separately because they are small in number. Hindus include all religious groups other than Muslim

++ : Due to small size low and medium categories of SL1 have combined.

in the standard of living. This is true in Punjab, Maharashtra and Uttar Pradesh but in Kerala the relationship is not very clear. The table also reveals a strong negative association between education of couples and their desired family size.

Information on family planning behaviour is also provided in Table 3. There exist some differences in either the current use of contraceptive methods or the unmet need⁴ for family planning by living condition and education of couples. But they generally tend to be small and do not suggest that the high fertility among the disadvantaged group could be because of their inability to control fertility. The unmet need for family planning among couples with a low level of living is higher than among couples enjoying a high level of living in Punjab, Maharashtra and Uttar Pradesh. It is possible that the strong negative relation between the level of living and fertility observed in Punjab might decline to some extent if the unmet need by level of living becomes uniform.

To have a better understanding of the relationship between fertility behaviour and standard of living, regression analysis has been used. The results are shown in tables 4 and 5. Regarding actual fertility (children ever born among women with at least 10 years marital duration) and standard of living (Table 4), the results suggest that, in general, with an improvement in economic condition, the fertility tends to decline. This is true in the case of Punjab and Maharashtra. In Kerala, there exists a significant negative interaction between education and standard of living in influencing the fertility. In other words, the reduction in fertility with the economic condition is significantly higher among the educated group compared to less educated couples. In Uttar Pradesh, however, the fertility is significantly higher among women belonging to the medium standard of living compared to those with a low level of living. But fertility is even lower among women of Uttar Pradesh with a high standard of living than among women enjoying a low standard of living; and the reduction is significant in the case of the educated group (the interaction between high standard of living and education of couple is negative and significant). The finding, therefore, reveals that fertility is significantly lower among women with a high standard of living than among those with the low standard of living in all the states. Further, this reduction in fertility, as hypothesised earlier, is more perceptible among the better educated group of couples.

The relation between landholding and

the fertility also turns out, in general, to be negative. Higher landholding leads to lowering of fertility. This is particularly true in the case of Punjab which is agriculturally the most prosperous state. This is also true in Uttar Pradesh, though the difference in fertility between women living in households with more than 5 acres of land and those with no land is statistically significant only at 10 per cent level (Table 4). In Kerala, landholding shows no relationship with fertility [Zachariah 1984; Zachariah et al 1994; Zachariah and Irudaya Rajan 1997] and in Maharashtra, on the other hand, the fertility is found to be higher among couples with more than five acres of land than among the landless. As indicated earlier, landholding is positively associated with standard of living. Also, there is a strong association between education of a couple and size of landholding. While the percent of educated couples declines substantially among the landholders in Punjab, Maharashtra and Uttar Pradesh, in Kerala it is just the opposite. In Kerala, the percent of educated couples is almost double among the landholders compared to that among the landless. This multicollinearity between the three variables (education, landholding and standard of living) makes the correct assessment of their individual effects somewhat difficult. In fact, the standard of living and landholding are integral part of overall economic condition of a household, particularly in the rural areas. If the two variables are combined, there is no doubt that the resultant indicator of economic condition will not show a positive relation with fertility and in all likelihood will have a negative relationship.

Another point which is noticeable from Table 4 is that mortality tends to make a significant difference in the level of fertility. The rate is much higher (statistically highly significant) among women who experienced child loss compared to those who did not have such an experience. This is true for all the four states. The significance of this can be understood better by the fact that 54, 30, 24 and 17 per cent of couples in Uttar Pradesh, Maharashtra, Punjab and Kerala had experienced child loss. The experience of child loss was lower among the educated group, almost half of that in the less educated group. In fact, this is one reason why the effect of education reduces substantially as experience of child loss is controlled in the regression. If instead of children ever born, children surviving are considered, the difference between the educated and less educated couples would narrow down

substantially. The experience of child loss was, however, not found to be associated with either the standard of living or landholding.

The effect of child loss on fertility may not exactly represent the effect of mortality on fertility. There is a reverse effect of fertility on mortality. Although the exact magnitude of the effect may be debated, it is certain that there is a tendency among mothers, who experience child loss, to replace the deceased children and that a decline in mortality will help in accelerating the fertility decline [Syamala and Roy 1994].

The regression coefficient of work status indicates that fertility among the working women is either same (in Kerala, Punjab and Maharashtra) or higher (in Uttar Pradesh) than that among non-working women. However, it is interesting to note that the interaction between work status and education is negative and significant in Uttar Pradesh and Maharashtra. The negative work-fertility hypothesis is substantiated in these two states only in the case of educated couples. Among the less educated group, the relationship is either absent or positive. Of course, the positive relationship between work and fertility may in fact be an artifact of the effect of fertility on work status. Less educated women with higher fertility may have greater compulsion to earn for subsistence.

The broad findings of the analysis of fertility preference (shown in Table 5) agree with that of the actual fertility. In Punjab, Maharashtra and Uttar Pradesh, the ideal family size declines with better living condition and this trend does not change with the couples' education. The desired number of children declines significantly with the education of couples. In Maharashtra, like actual fertility, the fertility preference of the younger cohort also shows a positive relationship with land holding.

CONCLUSIONS

To summarise our findings data on the standard of living (economic status) is not always sufficient to understand the complex mechanism of fertility decline. A set of other social factors are at work which directly or indirectly influence the couples' decision on family size. Thus there can be no such thing as a purely economic theory of fertility [Caldwell 1977].

Among the four states under investigation, only Punjab displays the expected negative association between living standard and fertility change. The impressive record of economic development prior to

the social development in Punjab gave rise to new security of life and livelihood, which was a crucial factor that enabled people to have the confidence adopt universal fertility control [Das Gupta 1995]. This is also evidenced by the fact that landholding has a strong negative relationship with the fertility only in Punjab. The same line of findings in case of Punjab can also be observed from the study of Nag (1984). However, the unmet need for family planning was found to be higher among households with a low level of living. To the extent that this unmet need is met by the programme, the negative relationship between economic condition and fertility in this state will become weaker. But at the same time it needs to be mentioned that the variation in fertility preference by standard of living suggests that the negative relationship will continue in future.

The negative relationship between standard of living and fertility is also evident, though to a lesser extent compared to Punjab, in the other three states, and it is more pronounced in the case of the better educated group. Except in Kerala, fertility preference also declines with better living condition in the other two states. In the

case of Kerala, the attitudes of couples towards ideal family size have not at all been influenced by the living standard. Perhaps, the uniform social development and better diffusion of the programme [Mari Bhat and Irudaya Rajan 1997] has led to the universalisation of small family size norm in this state.

Notes

- 1 There can be a difference between the desired fertility and the actual fertility performance. Fertility desire among the economically disadvantaged group may be low, but due to high cost of contraception (economic as well as psychological, including lack of knowledge and accessibility of contraceptives) their actual fertility may be high. The positive relationship between economic condition and actual fertility, it is argued, will emerge stronger in societies where contraceptives are widely accessible. On the other hand, the actual fertility performance of the poorer group may get adversely affected by their lower fecundity, which tends to be related to health condition, nutritional deficiency, occurrence of fertility impairing diseases and health care seeking behaviour during pregnancy and child birth.
- 2 By economic condition of women, we mean the standard of living of households in which they live.
- 3 The latter index provides information on the proportion of women having at least i ($i = 1, 2, 3, \dots$) births.

APPENDIX TABLE: SCORES FOR THE VARIABLES USED IN THE COMPUTATION OF STANDARD OF LIVING INDEX (SLI)

Variable	Scores		
1 Separate room for cooking	Yes	= 1

Religion-Specific Differentials in Fertility and Family Planning

K Moulasha
G Rama Rao

The relationship between religion and fertility behaviour has prompted much interest, especially in the context of the rising population in developing countries. In India data reveal that the fertility rate among Muslim women is significantly higher than for Hindu women which may in the first instance be attributed to such practices as post-partum abstinence and the length of amenorrhea after child birth. Clearly, however, there are more complex socio-economic reasons for the differential behaviour of the two communities that needs to be better understood.

RELIGION has a more significant influence on demographic behaviour in developing countries than in more developed countries. A high level of fertility has been associated with the religious prohibition of the use of birth control and values about the importance of children, priority of the family and gender. In this context, the reduction of fertility differences among religious groups suggests a decline in the influence of religion on the choices of persons about childbearing and contraceptive use [Chamie 1981]. The rapid population growth in the developing world has led to an increased interest in religious values that may affect efforts to reduce fertility levels [Goldstein 1970] and the relationship between religion and fertility behaviour. The subject continues to be discussed in India since the 1950s.

In order to explain the religious differentials in fertility, social scientists and demographers have formulated four major hypotheses [Goldscheider 1971; Chamie 1981]. They are: (i) the 'characteristics' (or assimilationist) hypothesis; (ii) the 'particularised theology' hypothesis; (iii) the 'minority group status' hypothesis; and (iv) 'interaction' hypothesis. Advocates of the 'characteristics hypothesis' argue that religious differentials in fertility are essentially a result of differences in the demographic, social and economic attributes of the members of religious groups. In contrast, supporters of the 'particularised theology' proposition contend that religious differentials in fertility are due to differences in religious doctrine. For example, in a summary article on Muslim natality, Kirk (1967) argued that Islam has been a more effective barrier to the diffusion of family planning than other religions. El-Hamamsy (1972) and Omran (1973) suggested that in order to understand the higher fertility of Muslims, greater importance should be given to the effect of the belief system on the behaviour level and existing socio-economic condi-

tions in their respective countries and less to Islamic theology. The third proposition 'minority group status' views fertility differentials among various religious groups within the larger context of fertility and social organisation. Its advocates maintain that insecurity of minority group membership depresses fertility below that of the majority group when (1) acculturation of minority groups has occurred in conjunction with the desire for acculturation; (2) equalisation of social and economic characteristics occurs and/or social and economic mobility is desired; (3) no pro-natalist ideology is associated with the minority group and no norm discourages the use of efficient contraceptives [Goldscheider 1971]. Chamie's (1981) 'interaction' hypothesis maintains that fertility differentials depend on the interaction between the socio-economic levels of the religious groups and the local orientations of these groups toward procreation and fertility control.

India is a country with a pluralistic religious society. Among them, Hindus form a majority with 82 per cent, followed by Muslims with 12 per cent [RGI 1991]. Therefore, the discussion is confined only on Hindus and Muslims of India as the changes in the reproductive behaviour of these two groups will influence the demographic as well as the political scenario of the country. In this paper, an attempt has been made to study the fertility and contraceptive practices of these two communities as observed from National Family Health Survey (NFHS). The analysis is based on interviews with 79,640 currently married (69,570 Hindu and 10,070 Muslim) aged 13-49 years. The proportions of Muslim women among the younger age (13-14, 15-19 and 20-24 years) were slightly higher than those of Hindus.

The religious composition of India has been changing and the proportion of Muslims has been steadily increasing for decades. Data from different decadal

censuses show that except during 1941-51, the growth rate of Muslims has been higher than that of Hindus. The higher growth rate of Muslims prior to 1951 was perhaps due to conversion, but since in recent periods conversion of Hindus to Islam has been rare, the observed differentials in growth rates between Hindus and Muslims must be attributed to differences in the components of population growth, viz. fertility, mortality and migration. Although Hindus were more migratory than Muslims in the past, it is unlikely that the effect of this component on the overall growth rate of the two communities has been significant. According to the 1951 Census, the share of Muslims in the total population was 9.9 per cent and it has increased to 12.1 per cent in 1991; whereas the proportion of Hindus has declined from 84.9 to 82 per cent during the same period. Therefore, the observed variation in growth rates between these groups remains to be explained in terms of differences in mortality and fertility [Visaria 1974; Balasubramanian 1984]. Generally, the higher fertility of Muslim is believed to be primarily responsible for their higher growth rate [Kulkarni 1996].

The growth of population of different religious groups is determined by the various social and economic characteristics of the respective groups. Information about such differentials is necessary to identify the factors and assess the prospects for change in the composition of population in various groups. It is also helpful in identifying the major determinants of the fertility level of the population. Above all, it provides clues about future fertility trends of the population.

Background Characteristics

Place of residence: One in four Hindus lives in urban areas whereas among Muslims the proportion is one in three. To study the difference in their social condition, their literacy level has been con-

sidered as a key variable. It is found that the proportion of literates among Hindus is slightly more than among Muslims. If we look at the educational attainment by religion, Hindus have done better than Muslims. Data regarding the educational status of the two groups by place of residence show no significant difference in the literacy rate of rural Hindus and Muslims but in urban areas, 65.3 per cent of the Hindus were literate whereas among Muslims, the percentage was 47.9 (Table 1). The data suggest that the Muslims did not go for higher education as compared to their counterparts and stopped their schooling at an early stage. The possible reason for the educational backwardness of Muslims is their lower socio-economic condition. Work status of the spouses shows that irrespective of religion, nearly all of them participate in economic activity because most of them are in the prime working ages. A sizeable proportion of the Hindus (43 per cent) worked in agriculture, and production and transportation (26.3 per cent); the corresponding figures for Muslims were 26.6 and 39.6 per cent respectively. Details regarding those spouses engaged in agriculture show that more Muslims were farming rented land while Hindus cultivated their own land. It shows the relatively poor condition of the Muslims. Data regarding the respondents' work status reveal that only 15 per cent of the Muslim women participated in work whereas for Hindu women the figure was 34 per cent. Among the workers, the percentage of women working for cash was less among Muslims. Distribution of respondents' occupations by religion shows that the Hindu respondents, like their spouses, mostly participated in agriculture (65.7) and production/transportation (21.9 per cent) while among Muslim respondents, an identical 42 per cent worked in the two sectors.

Fertility and Its Preferences

The NFHS estimated fertility levels, trends and differentials among Hindus and Muslims. The current and cohort fertility levels show that Muslims have a higher fertility than Hindus (Table 2). On an average, Muslim women have 1.1 children more than Hindu women. It is often argued that religious differentials in fertility may be due to socio-economic differences among the different religious groups rather than religious affiliation itself. However, to measure the role of socio-economic conditioning influencing the religious differentials in fertility, it is examined with the level of education. At each level of education, the TFR of

Muslims is higher than that of Hindus. Among the first three educational categories, TFR of Muslims is 23-26 per cent higher than that of Hindus. The difference was even larger (43 per cent) among women who had studied up to high school and beyond. Thus controlling for the effects of education only decreases religious differentials to some extent, but the difference exists. It should be mentioned that fertility generally declines sharply with increasing education in both religious groups.

Differentials in the number of children everborn and surviving indicates that Muslim women had given birth to 0.6 child more than their Hindu counterparts. Interestingly, among the children everborn to Muslim women, the sex ratio at birth was slightly favourable to female as compared to that among Hindus. The difference between the average number of children everborn and surviving was the same (0.4 children) among both Hindus and Muslims. Surprisingly, though the Muslim women gave birth to a slightly more number of children than Hindus, the quantum of child loss was the same among both the groups. In other words, the Muslim women had a lower rate of child loss than Hindus.

Birth intervals are an important indicator of the pace of child bearing. Earlier studies have shown that children born too close to a previous birth have an increased risk of dying, if the interval between births is less than 24 months [Govindasamy et al 1993]. Among the major determinants of fertility, lactation amenorrhoea and postpartum abstinence are significant. The duration of postpartum amenorrhoea following birth is closely associated with the duration of breast feeding which tends to suppress the resumption of ovulation. Conception can also be delayed by prolonged postpartum amenorrhoea and abstinence. The total period of protection against conception from amenorrhoea or abstinence or both is defined as the non-susceptible duration. Table 3 shows that median birth interval during the five years preceding the surveys was around two months higher among Hindus. Overall, 29 per cent of Muslim births occurred within 24 months of the previous birth while the corresponding proportion among the Hindus was 25 per cent. As shown in Table 4, the relatively shorter median birth interval of Muslims probably reflect the cessation of breast feeding and the consequent shortening of the period of postpartum amenorrhoea. The median duration of postpartum amenorrhoea, postpartum abstinence and postpartum non-susceptibility was longer among Hindus. To be

precise, among Muslims, the duration of PPA is one month shorter and postpartum abstinence is 0.7 month lower and postpartum non-susceptibility is 1.1 month shorter than among Hindus. It is to be mentioned here that though the Koran emphasises that the mother should suckle her children for two full years, it seems to be overlooked by the Muslim women for some reasons.

Childbearing at Younger Ages

There has been a growing worldwide concern over the fertility of women under the age of 20, primarily because of its

TABLE 1: AGE AND EDUCATION OF EVER-MARRIED WOMEN BY RELIGION

adverse health and social consequences [The Alan Guttmacher Institute 1998]. High adolescent fertility seems to affect the health of teenage mothers and their infants. It has also emerged as a social issue, particularly in developing countries, because early childbearing may cause an interruption of education, resulting in low future income through fewer labour force options and a larger completed family size.

As shown in Table 5, the proportion of ever married women in the age 13-19 among Hindus and Muslims was 10.7 years and 11.7 years respectively. Overall, around 58 per cent of ever married teenage women had started their childbearing before reaching the age of 20. The corresponding percentage of Muslim women is six points more than that of Hindus (62.3 per cent compared to 56.8 per cent).

Onset of Childbearing

The onset of childbearing is an important indicator which reflects prevailing fertility trend. Median age at first birth among Muslims was 18.9 years as compared to 19.5 years among Hindus. Muslims begin childbearing at a slightly younger age than Hindus (Table 5). Another important determinant of fertility level, age at last birth, also shows that Muslims continue childbearing into their late 30s and 40s. The likely reason for Muslims having a lower age at first birth and a higher age at last birth than the Hindus seems to be their less frequent use of contraception. The difference between the median age first birth and the last birth implies an estimated average reproductive life of 14 years for Muslims, whereas this span is three years shorter for Hindus. As of 1992, the effective reproductive span (difference between age at first and last child) among women in Kerala was only 4.33 years whereas the same span for Rajasthani women was 14 years [Mishra and Irudaya Rajan 1997].

Family Planning

In a country like India, success of the family planning programme is entirely dependent on the strategy of the programme to suit and meet the need of the different groups of inhabitants. It is naive to expect that all people will respond to a programme in the same manner. So it would be meaningful if we go into the details of knowledge, attitude and practice of family planning by religion as it will be useful for policymakers and programme administrators.

According to the NFHS, in India, modern methods of contraception are more exten-

sively known than the traditional methods. Substantial differences are noted with regard to the knowledge about methods by religion. Table 6 reveals that a slightly higher proportion of Muslim women had knowledge about contraceptive methods than Hindu women. The proportion of Muslim women knowing any method of contraception and also a modern method of contraception was higher than that among Hindus. However, the level of knowledge about sources of contraceptive methods was lower among Muslims.

Table 7 shows the level of contraceptive use among currently married women who had reported that they knew at least one method of family planning. Although a higher proportion of currently married Muslim women reported knowledge of at least one method of family planning, the proportion of those reporting current use of any method was considerably lower

than that among Hindus, particularly for permanent methods (Hindus 32.7 per cent, Muslims 16 per cent). A similar picture emerged with respect to the current use of modern methods. On the other hand, the current use of modern temporary and traditional methods was slightly higher among Muslims than among Hindus. It is clear from this table that religious differences in contraceptive use are quite significant. These differentials may partly reflect the relationship between the level of education and contraceptive use; a part of these differentials may disappear once the level of education is controlled. The same table also shows that the religious differential in contraceptive use rate tends to narrow as the educational level of the women increases. The use of any modern temporary method is, however, higher among Muslims than among Hindus in each educational category. The analysis

suggests that religious differences in contraceptive use persist even after controlling for education. This information corroborates the earlier findings that Muslims prefer modern temporary methods rather than sterilisations or abortion and also that Muslims too like to control their family size.

Exposure to Family Planning Messages and Its Acceptability

To assess the spread of family planning messages through various mass media, respondents were asked whether they had heard or seen any messages to promote family planning on radio or television. Although a majority of the Muslims live in urban areas, their exposure to family planning messages was a little lesser than that of Hindus. The proportion of Hindus having heard a message on radio and televisions was slightly higher than that of Muslims. The acceptability of the family planning messages was also higher among Hindus than among Muslim women (Table 8).

Discussion and Attitudes of Couples Towards Family Planning

The non-sterilised currently married women who knew a contraceptive method were asked how often they had talked with their husbands about family planning in the year before the survey. An identical percentage of Muslim and Hindu women had a discussion with their spouses. There is difference in the extent of discussion of family planning between them but more number of Muslim women discussed about family planning more often in the last year than their counterparts (Table 8).

Couples' opinion on approval of family planning is one of the determinants of acceptance of any contraceptive method by women. Information on attitudes towards family planning was obtained by asking non-sterilised women whether they and their husbands approved or disapproved of it. The proportion of Muslim couples having a positive attitude towards family planning was around 10 per cent lower than that of Hindus (Table 8).

Fertility Preference

Children provide certain invaluable satisfactions to parents. Invariably all religions emphasised about the positive functions of having children. Thus, there has been resistance to human interference with fertility from all major religions. Information regarding the potential demand for family planning shows that the desire to have more children in comparatively higher among Muslims than among their

Hindu counterparts. Interestingly, 61 per cent of the Muslim women who had two living children did not want additional children, whereas the corresponding percentage for Hindus was 39 (Table 9).

Ideal Number of Children

The key factors influencing fertility of married women are the number of children they desire. Table 10 shows that the ideal number of children desired by Muslim women was higher than that of their Hindu counterparts in each age group. The average number of ideal children reported by Muslim women of each age group was higher than was reported by their Hindu sisters, but the differences between the two group widened with increasing age.

Unmet Need for Family Planning

The total unmet demand for family planning was higher among Muslim women than among Hindu women. According to the NFHS, one-fourth of the Muslims who either did not want any more children or wanted to wait two or more years before having another child, were not using contraception. These corresponding percentage for Hindus was 19 (Table 11).

Fertility Planning

The TFR can be divided into 'wanted' and 'unwanted' portions. The unwanted portion of fertility relates to the birth about which the mothers reported that at the time she became pregnant, she did not want to have any more children; the wanted TFR

TABLE 8: DIFFUSION OF FAMILY PLANNING BY RELIGION (Per cent)

Exposure to FP Messages	Hindus	Muslims
Radio and television	41.7	40.0
Acceptability of messages	68.3	64.3

comprises all other births, that were wanted later than they actually occurred. Religious differences in wanted and unwanted components of the TFR and in ideal family size are given to facilitate comparison.

Considerable differences in all three measures are evident by religion (Table 12). TFR, TWFR and ideal number of children among Muslims are comparatively higher than among Hindus. The TFR of Hindus (3.30) is 28 per cent higher than the total wanted fertility rate (2.58), whereas, the corresponding percentage for Muslims is 32.

According to NFHS, Muslim women had 1.1 children more than Hindu women. The possible reason could be the longer reproductive span of three years than Hindus. Muslims also have reported a shorter period of post-partum amenorrhea and post-partum abstinence than Hindus. Muslims have a lower mean age of first birth and higher age of last birth consequently resulted in more number of reproductive years than their counterparts. Muslims were found to be less inclined to use modern contraceptive methods and they preferred to use the modern tempo-

Economic and Caste Criteria in Definition of Backwardness

K Srinivasan
Sanjay Kumar

While the NFHS was conducted with the primary objective of collecting data on reproductive status, it has generated considerable data on caste and economic conditions. An analysis of this data set shows that there are wide differentials in the economic conditions of the socially backward castes and classes. This raises vital questions on the role and relevance of caste-based privileges.

I Introduction

A UNIQUE feature of the Indian society is the caste system. The stratification of the Indian population into sub-groups defined by caste, which is determined by birth, has been in existence for thousands of years. It is now considered one of the major social hurdles in the development of the nation. The social distance between the caste groups varies from state to state, but generally there is a well established hierarchy of castes that can be considered under four broad headings, namely, brahmins, kshatriyas, vaisyas and shudras, and such a stratification can be traced back to the Vedas. It appears that the major stratification in terms of castes ('varna') was originally based on occupational division without a vertical social hierarchy. However, over the centuries the 'varna' system seems to have expanded and became rigid with many subcastes ('jatis') springing up within each major category. There are innumerable subcastes among brahmins, kshatriyas, vaisyas and shudras, and the differentiation between the subcastes within a major caste category has also widened over the years. Most of the marriages even today take place within a subcaste and intercaste marriages are socially not yet accepted.

Social reformers rose in revolt against the rigidities and injustices springing from the caste system. A particularly evil practice is that of treating many caste groups as 'untouchables' or social outcasts. During the past few centuries, many social reformers have agitated, written and canvassed against the evils of the caste system. Prominent among such social reformers are Sant Ramdas in Uttar Pradesh, Guru Nanak in Punjab, Raja Ram Mohan Roy in West Bengal, Basavappa in Karnataka, Narayana Guru in Kerala and Periyar in Tamil Nadu. One of the most recent crusaders of social reforms in the country was Mahatma Gandhi, who fought for the emancipation of the down-

trodden castes as a part of the independence movement. Gandhi called the poorest and lowest among the caste hierarchy, who are considered untouchables by the rest, 'Harijans' or children of 'Hari' (God). Another historic figure championing the cause of downtrodden caste groups was B R Ambedkar, the architect of the Constitution of India.

With the attainment of independence in 1947 and the strong views of Mahatma Gandhi prevailing within the Congress Party, the Constitution of India in 1950, adopted special provisions for the uplift of the weakest in the caste hierarchy.

Articles 341 and 342 of the Constitution included a list of scheduled castes (SCs) and scheduled tribes (STs) for whom special benefits were to be given to uplift them from their continued backwardness in society because of the caste structure. Those castes which were considered to be at the bottom end of the social order in the country were identified state by state for special benefits through reservations in educational institutions, employment, subsidised food, political representation in legislatures and the parliament. The special privileges were intended to help the backward castes/tribes to join the

mainstream of national development. The lists of SCs and STs originally promulgated as part of the Constitution of India, have been modified, amended and supplemented from time to time, and a more recent updated series has been published in the Scheduled Castes and Scheduled Tribes Orders (Amendment Act) 1976.

The Mandal Commission, which went into the question of reservations had also included many other castes, that were not covered in the list of SCs and STs, in the category of other backward castes (OBCs) and recommended special privileges to them in order to lift them from their socio-economic backwardness. The OBCs were identified by the central government as common list and by each state as a special state list.

II

Data and Method of Analysis

In this context, it is necessary to examine how far some of the castes, which have been receiving these special privileges over the past 50 years, have improved their conditions, and to study whether the differentials in economic conditions between the caste groups have narrowed down. The data collected in the 1931 Census were the last comprehensive body of information on the economic conditions of different castes in the country. Though information on caste was collected in the 1951 Census, it was not analysed for various reasons and the information on caste was not collected in the subsequent censuses. The classification of OBCs by the Mandal Commission in 1980 was based on the economic conditions of households in the 1931 Census. The National Family Health Survey (NFHS) has provided an opportunity to study the relationship between caste and economic condition. NFHS was conducted with the primary objective of providing reliable and comparable esti-

mates of fertility, infant mortality, contraceptive use, reproductive health, family size desires, etc., for the states of India. In addition to questions on these topics, information was also collected on caste of the head of the household and economic conditions of the household, such as type of house, source of lighting, availability of protected water, toilet facility, modern objects owned, viz, watch, radio, bicycle and literacy levels of the members of the household. Thus this data set presents a

unique opportunity to study the differentials in socio-economic indicators by caste.

For the present analysis, data from the states of Uttar Pradesh, Bihar and Tamil Nadu, have been used; the number of households covered in the survey from the above states was 10,110; 4,748 and 4,287 respectively. The survey work in UP was carried out between October 1992 and February 1993, in Bihar during March-June 1993 and in Tamil Nadu between April and July 1992. The survey provided a unique opportunity to analyse the economic conditions and other demographic characteristics of the households by caste.

From the data compiled in the NFHS, we identified a group of castes in each of the three states which are considered to belong to (i) scheduled castes, (ii) other backward castes, and (iii) other castes. These are based on the list of SC/ST or OBC published either by the state or by the centre. Those castes, in each of the broad categories, which have at least 50 households in the sample were included in the analysis. The data for selected castes were analysed to estimate their literacy rates and economic conditions of the households. The following six factors were

used to study the household-level economic conditions:

(1) Whether there is an adult literate person in the household: code 0 if none, 1 otherwise;

(2) Whether the house in which they are residing, is kutchra: code 0 if yes, 1 otherwise;

(3) Whether the house is electrified: code 0 if not electrified, 1 otherwise;

(4) Whether there is a toilet facility, owned or shared, for the household: code 0 if no such facility, 1 otherwise;

(5) Whether the household possesses irrigated land: code 0 if no, 1 otherwise; and

(6) Whether any household member possesses any of the following objects – a watch, a radio, or a bicycle: code 0 if none, 1 otherwise.

For each household in the selected caste group, data on six items were compiled from the NFHS from the households selected. A household economic score was computed on the basis of these six items in two steps: by scoring as 0 and 1 against each item and summing them up. Obviously, households with a score of zero are very poor and have practically no material possessions. For the purpose of this analysis, we considered the households with a score of 0 and 1 as 'most poor', 2 and 3 as 'poor' and 4, 5, 6 as 'not poor'. The economic conditions of households in the categories of SC, OBC and other castes were studied as defined above. The analysis was carried out separately for households from the rural areas and combined with urban households. The findings are presented below.

III Level of Poverty

Tables 1A, 1B, 1C present the percentage of households without a single literate adult member, resident in kutchra houses, without electricity, with no toilet facility,

without irrigated land, and with no modern objects owned, studied separately by each variable. The findings for the three states can be summarised as follows.

Uttar Pradesh: For the state as a whole, 76 per cent of the households have no toilet facility, 66 per cent have no electricity in the households, 52 per cent are living in kutchra houses, 44 per cent have no irrigated land, 29 per cent with no adult literate member and 27 per cent have no modern objects, such as watch, bicycle or radio. These are miserable conditions indeed but they are far worse for the SC,

slightly better for the OBC and relatively better for the forward castes. For example, in rural areas, among chamars (SCs), 99 per cent of the households have no toilet facility, compared to 90 per cent among brahmins; 89 per cent of chamar households have no electricity compared to 64 per cent among brahmins; 73 per cent live in kutchra houses compared to 47 per cent among brahmins. In other words, the conditions of chamars who have been recipients of many privileges such as free education, housing loans, priority in employment, etc, for over 50 years now do not seem to have improved by these privileges. The differentials between the chamars and the brahmins are still quite wide. Among kumhar castes, which is considered an OBC, the conditions of households are similar to chamars, 43 per cent were without any literate adult member, 70 per cent live in kutchra houses, 86 per cent were without electricity, 95 per cent were without toilet facility, 32 per cent without irrigated land, 29 per cent had no modern objects. Here also special privileges for the OBCs do not appear to have had any impact on their lifestyles so far, though they have had special benefits during the past 20 years.

FIGURE 3: PROPORTION OF 'MOST POOR' IN TAMIL NADU

Table 2A presents the distribution of households classified as 'most poor', 'poor' and 'not poor' in terms of the scoring procedure defined earlier. According to the scoring criteria, about 18 per cent of the households can be categorised as most poor (with a score of 0 or 1 in the 0-6 scale) and as expected, the percentage is higher in the rural areas, 21 per cent. In the rural areas, the percentage in 'most poor' category is 42 among pasis who are SCs, 22 among kumhars who belong to OBCs and 7 among brahmins (Figure 1). The disparity remains very high between the SCs, OBCs and the forward castes both in the rural areas as well as rural-urban combined population.

However, an interesting finding from these two tables is the existence of strong differentials among castes within the SC category. For example, the percentage of 'most poor' in the rural areas is 42.1 among pasis, 33.2 among chamars, 32.6 among dhobis, who all belong to SC category. Similarly, among OBCs, there is a variation in the proportion of 'most poor' from 33.3 to 17.1 among three caste groups considered. Thus, it appears that there are not only wide variations between the major caste groups but also between castes within the SCs, OBCs and even forward castes. Grouping of SCs into one category for the purposes of providing special benefits does not appear to be a reasonable and logical procedure when there are strong intercaste variations in economic conditions emerging within SCs, OBCs and forward castes.

Bihar: Bihar appears to be the poorest of the three states considered. In the whole state, 80 per cent of the households have no electricity, 79 per cent have no toilet facility, 67 per cent live in kutch houses, 66 per cent have no irrigated land and 44 per cent have no modern objects, such as watch, bicycle or radio, 37 per cent of the households do not have a single

adult literate member. The conditions in Bihar appear to be far worse than in Uttar Pradesh.

Differentials among the SCs, OBCs and the forward castes are quite striking as in the case of UP. For instance, in the rural areas, 99 per cent of the chamar households have no toilet facility compared to 73 per cent of rajputs and 75 per cent of brahmins. The differentials are more striking in terms of literacy: while 53 per cent of the chamar households in the rural areas have no adult literate member in the family, it was 40 per cent for yadavs, who belong to OBCs and 9 per cent among

brahmins. Similar differentials exist with regard to each of the six items.

Table 2B provides the level of poverty in Bihar measured as 'most poor', 'poor' and 'not poor' categories for different castes as defined earlier. In the state as a whole 39.5 per cent of the households belong to 'most poor' category, and as expected their percentage was higher in the rural areas at 47.1 per cent. The castes belonging to the SC category have significantly higher proportion in the 'most poor' category compared to the castes in OBC category, which, in turn, is higher than the proportions for the forward caste category. For example: the percentage in the 'most poor' category in the rural areas was 67.2 per cent among chamars (SC), 50 among kumhars (OBC) and 7.1 among kayasthas who belong to forward caste category (Figure 2).

As was observed in the case of UP, even within the category of SCs, there is a substantial degree of variation in the proportion considered 'most poor' among different castes. For example, while this percentage is 67.2 among chamars, it is 50 among dhobis. The distribution of the three categories, 'most poor', 'poor' and 'not poor', varied among the castes within each category of SC, OBC and others. Among OBCs, the percentage in the 'most

poor' category was 50 among kumhars compared to 37.5 among teli. Even in the forward category in the rural areas, the percentage of 'most poor' was 15.1 among rajputs compared to 7.1 among kayasthas.

Tamil Nadu: In the state as a whole, 82 per cent of the households have no irrigated land, 71 per cent have no toilet facility, 36 per cent have no electricity, 37 per cent live in kutchha houses, 34 per cent have no modern objects (watch, bicycle or radio) and 21 per cent of households have no adult literate member. As expected, conditions are worse in the rural areas. Tamil Nadu has a long history of social welfare and development programmes aimed at abolition of differentials by castes. Such programmes go back to 1920s, more than two decades before independence. However, data from Tables 1C, 2C reveal that there still exist sizeable economic differentials between castes. This is a major surprising finding from the study. For example, in rural areas, among paraiyas, 97 per cent of the households have no toilet facility compared to 25 per cent among brahmins; 58 per cent live in kutchha houses compared to 10 per cent among brahmins; 62 per cent of the households have no modern objects (watch, bicycle or radio) compared to 5 per cent among brahmins, and 42 per cent of the households have no single adult literate member compared to only 5 per cent among brahmins. These large differentials in economic conditions between the paraiyas and the brahmins, in spite of more than 75 years of efforts of different political parties and bureaucracy to bridge this gap, are surprising and disappointing. The policies aimed at narrowing intercaste differentials in the state do not seem to have yielded the desired results.

Table 2C provides the level of poverty in Tamil Nadu among different caste groups. There are strong differentials in the proportion considered 'most poor' between the SCs, OBCs and the forward castes. Surprisingly, the differentials appear to be larger in Tamil Nadu than in UP and Bihar which did not have similar long-standing programmes to reduce economic differentials among caste groups. For example, in the rural areas, 47.4 per cent of the paraiyas are in the 'most poor' category compared to 0 per cent among brahmins and 4.2 per cent among pillais, both of which belong to forward caste category. An interesting finding is that even among the various castes within the SC category, there are very wide differentials. For example, while 47.5 per cent of pallas in rural areas (SC category) are found to be 'most poor', only 24.3 per cent

of kallans (also SC category) are in the most poor category (Figure 3). Similarly, there are significant differentials among the different castes within OBCs and within the forward castes category.

IV Caste and Poverty

There still exist sizeable differentials in the economic conditions of households categorised in terms of their social backwardness as SCs and OBCs and forward castes. These differentials are observed in all the three states considered in the study – UP, Bihar and Tamil Nadu.

Among these three states, Tamil Nadu has a long history of Dravidian movements to abolish the caste differentials encouraging intercaste marriage, anti-brahminism and providing assistance to SCs and OBCs. However, the assistance has not narrowed the differentials in the economic conditions between the caste groups in the state.

There exist wide differentials in the proportions of 'most poor' and 'poor' households between different castes within each category, SC, OBC and forward castes considered separately.

The time has come to reconsider the continuation of the special privileges in terms of, admission to schools, employment, targeted food subsidy, etc. on the basis of caste criterion alone. It seems more appropriate to target these benefits and incentives on the basis of criteria of poverty. For example, the households which are considered 'most poor' in our classification system, with score of 0 or 1 in a 0-6 scale taking into account conditions of literacy, type of house, source of energy used in the house, toilet facility, possession of land, and modern objects deserve to be given special attention in order to pull them out of abject poverty. This seems to be a valid and useful approach to share the benefits of development directly with the poor. Combining up of caste considerations with economic criteria for targeting the poor, does not seem to have worked during the past five decades in terms of tangible improvements in the economic conditions of the various caste groups.

In the present context of liberalisation of the economy and provision of social welfare benefits to the poor under the common minimum programme, it is necessary

to identify the most poor groups in the country especially in the rural areas and offer special benefits to them to bring them out of their state of abject poverty. This should be done irrespective of caste considerations such as SC, OBC and forward caste. Reports from earlier studies have revealed that the benefits given to a particular caste group may be totally absorbed by a 'creamy layer' and may not filter down to all the needy people within the caste.

Admittedly, the data used in this study were not compiled for the type of analysis presented above, but our findings highlight the point that economic criteria should form the basis of any welfare programmes including poverty alleviation programmes. The benefits of such programmes may not reach very needy people if they are targeted on the basis of caste considerations.

The generalisation is based on a limited number of households and selected castes in the sample. We have used the data to study mainly the differentials between different subcastes in the major caste category and between major castes groups. There is a need for conducting special studies on the interrelationship between caste and economic status.

Proposals for Occasional Papers

National Bank for Agriculture and Rural Development (NABARD) invites proposals from eminent economists/experts for preparation of Occasional Papers on following topics.

1. Role of Infrastructure in the Development of NFS.
2. Role of Informal Rural Financial Markets.
3. Role of Extension Support for promoting non-farm activities.
4. Growth and prospects of Handloom Sector in India.
5. Capacity Building of Panchayati Raj Institutions in Rural Development.

The proposals should indicate the objectives, methodology and scope of the paper and the total budget. The assignment shall be completed within six months from the date of its acceptance, against suitable honorarium upto Rs. 45,000 subject to the usual terms and conditions. The proposals may be addressed preferably within a month to the **Chief General Manager, Department of Economic Analysis and Research, NABARD, Jeevan Seva Complex (Annexe), 3rd Floor, P.B. No. 16926, S. V. Road, Santacruz (W), Mumbai – 400 054.**

Gender Preference Contraceptive Prevalence

Evidence of Regional Variations

P M Kulkarni

In India there are marked state and regional variations in gender preference. Its effect on contraceptive prevalence is far more complex than has been understood. Regions of strong gender preference do not necessarily show an adverse impact on contraceptive prevalence. What are the reasons for the lack of an expected concordance at the various levels of gender preference?

PREFERENCE for children of a particular sex is known to be quite strong in several countries, including India. In many societies, there is a preference for sons over daughters and hence son preference has been discussed frequently in the literature. But preference for daughters or for a particular sex composition of children has also been observed and hence one could examine gender preference as such. When efficient fertility regulation measures are available, such preference can influence fertility appreciably. The quantum of such impact depends on the nature and degree of gender preference and the extent to which such preference is translated into effective contraceptive use. It must be noted that gender preference is primarily attitudinal and would be expressed as a desire for a particular sex composition of children, or as the desire for a minimum number of children of a particular sex, or as the desire for the next child to be of a particular sex. Such a preference could be fitted into the total desired family size or the preference could itself dictate the total size. The preference could be translated into practice by deciding to continue childbearing until the desired number of children of a particular sex are born (and are surviving) and to stop once the desired number is achieved, provided, of course, that fertility regulation is feasible and acceptable. It is also possible that some couples stop childbearing to avoid a less preferred sex composition even when the desired composition has not been achieved. There are more serious implications of gender preference. Gender discrimination in child care (especially the neglect of the girl child) can influence child survival; female infanticide is an extreme form of such discrimination. Sex selective abortions can influence both fertility and sex ratios. But this is possible if the technology of sex detection is accessible and abortions on such grounds are permissible or possible/available. In the present paper, we concentrate only on the impact of gender

preference on contraceptive practice and through it on fertility.

A number of studies have examined the fertility impact of gender preference in India. Some of the early investigations found the impact to be quite small [Repetto 1972; Sarma and Jain 1974]. A few later studies, however, found the impact to be significant. Das (1987) analysed parity progression ratios (PPRs) from the data in a survey that covered parts of Gujarat and observed that the ratios at a given parity do vary considerably with the sex composition of living children. An examination of contraceptive practice also yielded a similar picture. Couples with a large number of sons or with a balanced sex composition tended to have lower PPRs and higher contraceptive prevalence than couples with a small number of sons. The effect was stronger in rural areas than in urban. Rajaretnam and Deshpande (1994) used the Arnold method to assess the impact of gender preference on contraceptive practice in a few districts of Karnataka and found that the impact was substantial.

Given the diversity within India, both gender preference and its fertility implications are likely to vary across the country. The National Family Health Survey (NFHS) carried out during 1992-93 included questions on preference for the sex of children as well as on contraceptive practice and fertility. The tables provided in the NFHS state reports and the computerised data sets available to researchers make it possible to obtain indicators of gender preference and its contraceptive impact and fertility consequences for various states.

The National Family Health Survey was carried out in 25 states of India as a series of state level sample surveys; with a common schedule except for minor modifications for individual states. A total of 38,562 households were covered and 89,777 married women of reproductive age were interviewed. The sample size in each state exceeded 2,700, except for the

six states in the north-eastern region in which the sample size was about 1,000 [for details, see IIPS 1995].

This paper first examines the indicators of gender preference from the NFHS tabulations for states in India. All the states except the six north-eastern states in which the sample sizes were small and Jammu and Kashmir, which was not fully covered in the survey, are included in the analysis. This discussion is followed by an assessment of the degree to which such preference influences contraceptive practice. The fertility implications of the elimination of gender preference are also discussed.

GENDER PREFERENCE

Gender preference can be expressed in various ways; to obtain a good summary measure can become difficult. The most appealing way to measure the preference is through the Coombs methodology which obtains a preference ordering of various sex compositions [Coombs et al 1975]. In practice, however, there are difficulties since the procedure involves a series of hypothetical questions, which are difficult to ask in a large survey. Therefore, most major surveys, including the NFHS, did not include Coombs type of questions. One can only obtain less sophisticated indicators based on the available information.

There were two questions on gender preference in the NFHS: Q 504 about the preferred sex of the next child and Q 517 about the preferred sex composition of the number of children desired in whole life. Q 504 reads: "Would you prefer your next child to be a boy or a girl or it doesn't matter?". It was asked only to those currently married women who had expressed a desire to have another child. Those who responded: a 'boy' or a 'girl' in response could be considered to be having a specific gender preference. Lahiri (1975, 1977) has called such a preference as 'sex cognisance' or 'sex consciousness'. An index on this can be constructed at the aggregate

level as 'the number of women who have specified a particular sex as preferred as per cent of all women who were asked the question' and is denoted here as I_1 . In the survey, many responded that the sex of the child is 'up to God'. Such a response would normally be taken to indicate a lack of specific preference. However, since the question provided a clear alternative, 'it does not matter', such an interpretation would not be correct. Therefore, the per cent specifying a particular sex was re-computed after excluding the 'up to God' responses from the denominator and denoted as I_1^* . The percentage distributions of responses to Q 504 for the 17 states are given in Table 1, and the indices I_1 and I_1^* in Table 2.

Q 517 reads as "How many of those (the desired number of) children would you like to be boys and how many girls?" and was asked to those ever married women who had given a numerical response to a previous question on the number of children desired in whole life. The responses are listed as 'boys', 'girls', 'either'. The sum of the means of desired number of boys and girls as a percentage of the mean of the total desired number of children gives an indicator of gender preference, labelled as I_2 . The means are given in Table 1 and the indicator I_2 in Table 2.

The indices used are admittedly crude. However, together, they do give an idea of the level of gender preference. The relative level can be seen from the ranks given in Table 2. Clearly, there is a broad regional pattern. Sex preference is quite high in the north-central and eastern states - Rajasthan, Uttar Pradesh, Madhya Pradesh, Assam, West Bengal, Orissa, Bihar, as well as in Punjab, moderate in the western-northern states (except Rajasthan) - Karnataka, Himachal Pradesh, Haryana, Gujarat and Maharashtra, and low in the southern states - Kerala, Tamil Nadu, Andhra Pradesh, as well as in Goa and Delhi.

Though the indicators relate to gender preference and combine preferences for male as well as female children, it is clear from Table 1 that the inter-state differentials are primarily a result of differentials in son preference. In the southern states, there is less asymmetry in gender preference (the preference for a male child is less than three times that for a female) as compared to many of the northern-central states in which the corresponding ratio is over five. The ratios of the ideal number of male children to the ideal number of female children are also lower in the southern states. Clearly, though parents value sons much more than daughters in

all the states, the tendency is less strong in the southern region. The prevalence of consanguinity and the fact that a married

woman maintains frequent contact with her natal home in the southern region [Karve 1968; Dyson and Moore 1983]

TABLE 1: RESPONSES TO QUESTIONS ON GENDER PREFERENCE, NFHS

Gujarat	56.1	10.5	70.5	8	84.6	15
Haryana	56.1	10.5	60.9	12	88.5	9.5
Himachal Pradesh	59.2	8.5	67.5	9	87.5	12
Karnataka	59.2	8.5	64.7	11	88.5	9.5
Kerala	55.2	12	58.2	14	74.1	18
Madhya Pradesh	65.7	4	81.3	3	96.8	3
Maharashtra	54.4	13	60.6	13	88.0	11
Orissa	62.5	6	66.7	10	96.7	4
Punjab	64.5	5	73.7	7	92.3	7.5
Rajasthan	73.6	1	84.5	1	100.0	1
Tamil Nadu	46.1	17	50.8	17	76.2	17
Uttar Pradesh	61.7	7	81.6	2	97.0	2
West Bengal	70.8	3	78.1	5	92.3	7.5
India	59.6		71.0		93.1	

Notes: The indices I_1 , I_1^* and I_2 are computed from Table 1 as given below:

I_1 = Percentage who prefer the next child to be of a specific sex.

= Col (1) + Col (2) of Table 1;

I_1^* = Percentage who prefer the next child to be of specific sex, after excluding 'up to God' response from the denominator.

= $100 \times [\text{Col (1)} + \text{Col (2)}] / [\text{Col (1)} + \text{Col (2)} + \text{Col (3)}]$;

I_2 = (Mean Ideal no of Sons + Mean Ideal no of Daughters) as a percentage of Mean Ideal Family Size.

= $100 \times [\text{Col (5)} + \text{Col (6)}] / \text{Col (8)}$.

perhaps contributes to the relatively high value attached to daughters in the south than in the north.

IMPACT ON CONTRACEPTIVE PREVALENCE

The impact of gender preference on fertility has conventionally been examined with the help of parity progression ratios (PPRs). A comparison of the PPRs at different sex compositions gives an indication of the impact of preference. However, the PPRs are influenced by past fertility and their analysis may not give a good idea of the impact in a population in which fertility regulation is relatively recent and desired family size has been changing in the recent past [for a discussion, see McClelland 1979; Arnold 1985]. McClelland (1979) considered a conjoint dominance procedure as well as a stopping rule measure that would not have some of the problems of the PPR analysis. But his procedures require data on the Coombs kind of preference ordering which are rarely available in surveys. On the other hand, a method proposed by Arnold (1985) provides a simple way to assess the fertility impact of gender preference from data that are commonly available. It involves computing an 'expected' contraceptive prevalence rate in the absence of gender preference. It is done by simply assuming that all couples with a given number of living children would have the contraceptive prevalence rate which is the highest for any sex composition with the same number of living children. In other words, it is assumed that one of the sex compositions is the most desired and hence has the highest prevalence level and in the absence of gender preference all couples with the same number of living children would have the same prevalence level. Criteria other than contraceptive prevalence can also be used in the same manner. Though the Arnold method has some shortcomings pointed out by Bairagi (1987), especially if there is heterogeneity in preference, the effect of such a heterogeneity would be quite small in practice [Arnold 1987]. Hence, it was decided to use the Arnold approach in the present paper.

The NFHS has provided tabulations of contraceptive prevalence by sex composition of living children. From these, the expected prevalence rate (in the absence of gender preference) can be easily computed. The NFHS tables are available for 0, 1, 2, 3, and 4 or more living children. The tables also give method-specific prevalence rates. For most methods except sterilisation, the prevalence level is quite low. Besides, the interest is not in the

prevalence of a particular method. Hence, only the prevalence of any modern method and the prevalence of sterilisation (either male or female) are used in computations. The actual and expected prevalence levels are given in Table 3 for each of the states. The difference indicates the depressing impact of gender preference on contraceptive prevalence.

At the all-India level, 36.3 per cent of couples of reproductive age were using a modern contraceptive. But had there been no gender preference, the use would have been higher by 4.7 points, at 41.0 per cent. There are large inter-state differences in the impact of gender preference. The contraceptive prevalence in the western-northern states, Gujarat, Himachal Pradesh, Haryana and Maharashtra, is severely depressed, by 8-10 points, but the effect is minuscule in the southern states—Andhra Pradesh, Kerala, Tamil Nadu, as well as in Delhi, Assam, Uttar Pradesh, and Goa (2-4 points). Since modern contraceptive use in India is dominated by sterilisation, the impact on per cent sterilised is fairly close to that on the use of modern methods.

As noted in the introduction, some assessments of the impact of gender preference have been made earlier. Sarma and Jain (1974) analysed the data from a national survey conducted in 1970 by the Operations Research Group and examined gender preference and contraceptive practice. Though the Arnold approach was not used (the Sarma-Jain paper precedes the development of the Arnold method),

it is possible to compute the Arnold measure from the tabulations in Table 7 of the Sarma-Jain paper. According to the survey, 12.2 per cent of the women were using some contraceptive, whereas, in the absence of gender preference, 15.4 would have used it. The effect is thus only 3.2 points. Note that the overall contraceptive use was small at the time.

For Gujarat, Das (1987) used PPRs for the assessment of the impact; but it is possible to compute the expected contraceptive prevalence level from a table provided in Das' paper (Table 3, p 524). The computations show that for southern Gujarat, the contraceptive prevalence rate would have been 72 per cent in the absence of gender preference against the actual rate of 61.9 per cent; thus the impact of gender preference was very high, 10.1 points. In Baroda city, the impact was moderately high, 7.2 points. These estimates are quite close to those from the NFHS for Gujarat (9.5 points) though Das' study refers to a date around 1980 whereas the NFHS refers to 1992.

In Karnataka, Rajaretnam and Deshpande (1994) found the impact of gender preference on contraceptive prevalence (computed using the Arnold method) to be 7.6 points in a district in the western part of the state, and 9.6 points in northern districts. The estimate based on the NFHS for Karnataka is much smaller, around 5 points. There is a large degree of heterogeneity within Karnataka. The northern districts, closer to Maharashtra, appear to be substantially affected by gender preference.

TABLE 3: ACTUAL AND EXPECTED CONTRACEPTIVE PREVALENCE RATES

State	Any Modern Contraceptive			Sterilisation		
	Actual	Expected	Difference	Actual	Expected	Difference
AP	46.5	49.0	2.5	44.7	47.1	2.4

Punjab	51.3	59.1	7.8	34.0	44.9	10.9
Rajasthan	30.9	36.6	5.7	27.7	34.0	6.3
Tamil Nadu	45.2	48.5	3.3	39.5	42.9	3.4
UP	18.5	22.2	3.7	13.1	17.0	3.9
West Bengal	37.3	44.2	6.9	30.6	37.2	6.6
India	36.3	41.0	4.7	30.7	35.7	5.0

Notes: Actual: As reported in the NFHS, for 1992-93; from the NFHS reports for various states.
Expected: Expected rate in the absence of gender preference, computed using the Arnold method [Arnold 1985] from Table No. 6.5 of the NFHS reports for various states.

ence as Maharashtra is. It is likely that the impact of 5 points for Karnataka is an average of high values in the northern region and low values in the southern region (closer to Tamil Nadu); a disaggregated analysis of the NFHS data may provide a clarification.

FERTILITY IMPACT

The results presented above refer to contraceptive prevalence rather than fertility per se. But the impact on contraceptive prevalence can be translated into fertility impact via the Bongaarts proximate determinants framework. The C_c term in the Bongaarts model, the index of non-contraception, is given by $(1 - 1.08 u_e)$ where u is the contraceptive prevalence rate and e is the contraceptive effectiveness rate. In order to see the impact of the elimination of gender preference, the C_c value can be recomputed using the expected prevalence rate (given in Table 3). The expected TFR value can then be computed from the actual TFR and the ratio of the actual and expected C_c values (for details, see Rajaretnam and Deshpande, 1994). Since contraceptive use in India is dominated by sterilisation, e would be only slightly less than 1, and a value of 0.96 has been assumed here. The results are given in Table 4.

The elimination of gender preference would reduce the TFR for India from 3.39 to 3.13, a decline of 8 per cent. For states like Himachal Pradesh, Maharashtra, Gujarat and Punjab, the decline would be large, over 15 per cent. However, in the case of low fertility states like Kerala, Goa, Andhra Pradesh and Tamil Nadu, the decline would be only marginal. As a result, the elimination of gender preference would bring fertility in Maharashtra, Himachal Pradesh, Gujarat and Punjab in line with a level comparable to Tamil Nadu-Andhra Pradesh and be near replacement. On the other hand, in high fertility states like Uttar Pradesh, Bihar, Assam, and Rajasthan, there would not be much fertility decline even if gender preference is eliminated.

A recent paper by Muthurayappa et al (1997) has examined the fertility impact of son preference on the basis of an analysis of the PPRs; the results are quite close to those obtained here using the Arnold approach.

DISCUSSION

The existence of a strong gender preference in India has been well known. The NFHS data show that though such a preference is observed in all the states, there are notable inter-state variations in its

degree. Further, gender preference has adversely affected contraceptive prevalence in all the states though this influence (and the consequent effect on fertility) also varies across the states. One would expect a close correspondence between the degree of gender preference and the fertility impact of such preference. The results in the paper show that this is true at one end of the spectrum; wherever gender preference is mild, as in Kerala, Tamil Nadu, Delhi, Goa, and Andhra Pradesh, the contraceptive prevalence is not much depressed and the fertility impact is very small. However, in some of the states with a strong gender preference, for example Uttar Pradesh and Assam, the impact on contraceptive prevalence is quite small. And in Rajasthan, Bihar, and Madhya Pradesh, the contraceptive (and fertility) impact is not so low, yet it is not commensurate with the extremely strong gender preference. On the other hand, in states like Maharashtra, Gujarat, Haryana and Himachal Pradesh, a moderate gender preference also appears to make a large impact on contraceptive prevalence and consequently on fertility. What are the reasons for the lack of an expected concordance at moderate and high levels of gender preference?

As long as the family size is high, most couples would have the minimum desired number of children of a sex as well. From simple calculations, it can be seen that for a couple with four children, the probability

of having at least one son is 15/16, and of at least one son and at least one daughter 14/16. As a result, there would be little

TABLE 5: ACTUAL AND EXPECTED PERCENTAGES NOT DESIRING ANY MORE CHILDREN

State	Per Cent Not Desiring Any More Children

UP	4.82	4.59	6.5
West Bengal	2.92	2.58	11.6
India	3.39	3.13	7.7

Notes: Actual: As reported in the NFHS, for a three year period preceding the survey, i.e. 1989-92; from IIPS (1995).

Expected: Expected value in the absence of gender preference, computed by substituting the expected prevalence rates (any modern contraceptive) given in Table 3 in the place of the actual rates in the C_c value in the Bongaarts model.

need to continue childbearing in order to achieve the minimum number of children of a sex and hence gender preference may not influence fertility much. On the other hand, a small family would be less likely to meet the minimum requirements of children of a particular sex. Only about half the couples with two children are likely to have one son and one daughter, and 3/4 would have at least one son. Naturally, many of those who wish to have some minimum number of children of a particular sex would like to continue childbearing. Even a moderate gender preference could then have a large fertility impact. This is probably what is happening in states like Gujarat, Maharashtra, Himachal Pradesh and Haryana.

What about Uttar Pradesh and Assam in which a very strong gender preference does not seem to make much impact on fertility? It must be noted here that though the impact of gender preference on contraceptive use as estimated from the Arnold measure is very low (3-4 percentage points) in these states, given the low level of contraceptive prevalence (below 20 per cent), the impact could, in fact, be termed relatively high. However, when the tendency to regulate fertility itself is very low, the impact would also be low in absolute terms, (as measured by the Arnold method) since even strong gender preferences are not translated into fertility behaviour to a notable degree. To some extent this is the case in Bihar and Rajasthan as well.

In order to see what would happen if fertility preferences are put into practice (that is, all couples who want no more children adopt modern contraception), responses to a question on the desire for additional children were tabulated in a manner similar to that of contraceptive, by the sex composition of living children. The Arnold method was then applied to these to obtain the expected percentage of couples desiring no more children (on the assumption that the per cent not desiring any more children for all couples with a given number of living children is the same as the maximum for any sex composition at that number of living children). The results are given in Table 5. It can be seen that in almost all the northern-central-western states, gender preference has a large impact on the desire for additional children. This suggests that once contraceptive practice becomes more widespread in these states, including Uttar Pradesh, a continuing strong gender preference would have a large impact on contraceptive prevalence and on fertility.

A comparison of the results of earlier studies with the more recent ones also points towards the same inference. Around 1970, the desired family size was large, the contraceptive practice was low and the gender preference had very little impact on contraceptive prevalence (3.2 percentage points as computed from the Sarma-Jain paper). However, the effect on desire for additional children was noticeable even at that time. Computations from the data in Table 7 of the Sarma-Jain paper show that whereas 50.7 per cent of couples did not want additional children, the percentage could have been 57.4 in the absence of gender preference, a difference of 6.7 points. Over time, contraceptive practice increased considerably, as did the fertility impact of gender preference as seen from the NFHS and other evidence. Since there is no reason to believe that the degree of gender preference itself has increased, the temporal changes do demonstrate how the quantum of fertility impact of gender preference can depend on the level of contraceptive prevalence as well.

Preference for the children of a particular sex, especially for sons, is strong in India as a whole with notable regional variations in the degree of such preference and its fertility impact. The analysis of the NFHS data indicates that in states like Maharashtra, Himachal Pradesh, Gujarat and Punjab, gender preference has stalled the fertility transition. The elimination of gender preference could reduce fertility substantially in these states bringing it close to the replacement level or at least to the level of the southern states of Tamil Nadu and Andhra Pradesh which exhibit only a mild gender preference. To some extent, this is true of Karnataka and West Bengal as well. In the central-northern states the gender preference is even stronger than in the western states, yet the fertility impact of such preference is low now because the contraceptive practice is also low and the desired family size is large. But these states have also experienced non-negligible fertility declines in the recent years and if family size desires fall further and fertility regulation becomes more common, the fertility in these states would continue to decline in the near future. The experience of other states indicates that at some stage, the strong gender preference will also begin to make a larger impact on fertility. As a consequence, the fertility transition in these states is also likely to stall above the replacement level at some point in future unless gender preference itself declines.

[This is a revised version of a paper presented at the XIX Annual Conference of the Indian Association for the Study of Population, in February 1996, at the MS University, Vadodra. The NFHS organisation at the International Institute for Population Sciences kindly made the NFHS data diskettes available. Thanks are due to the various agencies involved in the NFHS that collected and compiled the data making these easily accessible. Useful comments were received from S Irudaya Rajan, S Lahiri and T Rajaretnam. Suggestions from Pravin Visaria on an earlier version have been quite valuable in the revision.]

Demographic Transition in Maharashtra, 1980-93

Sanjeevane Mulay

The main thrust of the article is to evaluate demographic transition in Maharashtra, especially during 12 years from 1980-92, on the basis of data made available by two national surveys on fertility and mortality rates, and family health. The study shows that despite high contraceptive prevalence in Maharashtra, there is a very moderate decline in birth rate, in the state. Better reproductive health facilities leading to reduced foetal losses, lesser childlessness and reduced breast-feeding, can be said to be the main factor contributing in increase in fertility. In such situation, only strengthening of IEC component of the family welfare services can result in decline in fertility in Maharashtra.

It is a worldwide experience that socio-economic development is closely associated with the pace of demographic transition. Modern sectors of economic activity, spread of education and modern atmosphere in urban areas definitely help in bringing about a faster decline in fertility and mortality.

Maharashtra is a highly urbanised state with high income levels and also has the highest level of urbanisation among major states of India (38.7 per cent according to the 1991 Census). Further, the female literacy in Maharashtra is also quite high (52.3 per cent) and is next to Kerala. Credit naturally goes to social reformers like Maharshi Karve, Gopal Ganesh Agarkar, Mahatma Phule and many others who fought for women's development. During early twenties, pioneering efforts in the field of contraception were made by R D Karve and Shakuntala Paranjapye. This leadership was maintained even later, when the first vasectomy camp was held in Maharashtra. The state has got several awards for its best performance in family planning. Today also, the family planning programme in Maharashtra is one of the efficiently administered programmes.

With this background, it would not be wrong to expect that an efficient programme and a conducive social structure would lead to rapid fertility decline. Whether this has happened in Maharashtra is the main issue under discussion. The present paper has two broad objectives: (a) to examine whether the state has been successful in achieving substantial fertility decline till now; and (b) to study the various stages of transition. We shall briefly examine the mortality trends too.

The database for the study covers all available data on vital rates for Maharashtra since early fifties. Census, sample registration system and various fertility surveys conducted in Maharashtra have been extensively used. We divide the study into two parts. The first part deals with the demographic transition for the pre-1970 period while the second part deals with

the demographic transition in the post-1970 period.

DEMOGRAPHIC TRANSITION: PRE-1970 PERIOD

As far as the information on vital rates are concerned, it is known that before the SRS started giving annual estimates, only the decadal estimates given by the census actuaries were the main source of data on vital rates. According to these estimates, Maharashtra had a birth rate of 41.2 per thousand and a death rate of 19.8 per thousand during 1951-61. The birth rate was close to stagnant and was 39.6 in 1961-71, and the death rate decline to about 17. During 1971-81, the birth rate came down to about 33 and the death rate was 12 per thousand. Thus, we could observe that till 1970, the decline in birth rate was very slow, while the death rate declined quite sharply. This is the initial stage of transition. It is quite clear that because of the successful public health programmes and advancements in medical sciences, the deaths were fewer and fewer. But it is surprising to observe that the rising levels of education, income and urbanisation could not reflect in the decline in fertility rates. In such a situation, one wonders whether this 'no decline' is real; if it is real, is it an effect of unidirectional 'on decline' or is it an effect of offsetting of the factors leading to increase in fertility and those leading to decrease in fertility? Such an assessment needs detailed information regarding age specific fertility rates at different points of time. Obviously, the census reports do not give such details. Fortunately, demography division of the Gokhale Institute, Pune, had conducted a number of demographic surveys in early fifties and sixties and has provided valuable information on fertility and associated factors.

The first survey was conducted in Kolhapur city in 1950. It was followed by the survey in rural and urban areas of Pune district in 1951 and 1952, to be followed by surveys in rural and urban areas of

districts of Nasik, Satara and Kolaba in 1953-54. In 1955, surveys were done in rural areas of Ahmednagar, Ratnagiri, Belgaum, West Khandesh, Parbhani and Gulharga districts. In 1961, a survey of 1 per cent random sample of the residents of Pune city was done. These surveys were followed by an innovative work which was in the form of a survey and re-survey of same sample households in six villages of Satara district, with a gap of 12 years. The objective of this study was to assess the demographic changes during period as long as 12 years, i.e., 1954-66. From these surveys, three types of data sets are available. One gives the data on age specific fertility rates (ASFRs) for rural and urban areas of Nasik, Satara, Kolaba and six rural communities. The second data set gives the comparison of ASFRs for Pune city for 1951 and 1964, and the third data set gives the information on fertility rates in rural areas of Satara district for 1954 and 1966 (Tables 1 and 2). The information is truly valuable in the sense that one could have a genuine assessment of fertility transition in urban areas (Pune city experience) and that in rural areas (experience in rural Satara), during a period when there were no other sources of getting such detailed information on vital rates.

The data relate to years 1952-55 and show similar fertility patterns. The urban fertility shows slight variations. The total fertility rate (TFR) varies between 4.1 and 5.0 for rural areas while it moves from 3.6 to 4.8 for urban areas. Whatever the differences, they are mainly for the ages 18-22 and 23-27.

Table 2 gives an important piece of information on fertility transitions in rural and urban areas during a period of 12 years: the data for Pune city are based on the 1 per cent random sample surveys conducted in the city in 1951 and 1964. The rates are based on 957 and 1266 married women, respectively. Number of adjustments were made for making the comparison valid. On the basis of these adjusted data it was found that the decline

in the birth rate would be the order of 21 per cent. Other sources such as the family planning performance statistics and the vital registration records were used to assess the fertility decline and finally it was concluded that the decline in birth rate in Pune city during 1951-64 was of the order of 15-20 per cent.

Table 2 also gives the data on ASFRs for 1,485 and 1,847 married women from 1,694 households conducted at survey (1954) and re-survey (1966) in six villages of Satara district. This study has a distinctive feature, namely, that the same households are contacted after a gap of 12 years and hence an important factor, i.e., the effect of the difference in sample characteristics is controlled. As the table shows, there is a decline of 9 per cent in the TFR. The decline in fertility rates of younger women is larger (72 per cent). This could be due to rise in age at marriage. There are evidences to show that the age at marriage has risen substantially (from 14.5 to 16.2 years). The fall in fertility rates of other age groups could be explained by two factors, namely, the practice of family planning (FP) and the fall in the incidence of widowhood, the two factors acting in opposite direction. The total marital fertility rate (TMFR) had declined by about 8.5 per cent. The exercise of isolating the effects of rise in age at marriage, practice of family planning and fall in the incidence of widowhood showed that there was about 7 per cent fall in fertility due to rise in age at marriage, about 8 per cent fall due to FP practice and a rise in fertility of the order of 6-7 per cent due to fall in the incidence of widowhood. In other words, if there was no change in the incidence of widowhood, the fertility would have fallen by about 15 per cent. But because of the increased survival, there was a rise in fertility which counteracted with factors leading to decline in fertility.

As Bhat (1998) comments,

It appears that fertility rate rose substantially during the 1950s as mortality levels began to fall. According to my estimates the total fertility rose by at least one birth per woman and the resulting increase in the CBR accounted for about half of the rise in the growth rate of population between 1941-51 and 1951-61. It is possible that some regions in India experienced this rise in the level of natural fertility more than the others did and became laggard in the process of fertility transition. In explaining the regional differences in fertility in India, greater attention ought to be given to the levels that prevailed before the onset of fertility decline.

To summarise, firstly, the available information on the fertility transition in urban areas shows that there was a fall in fertility of the order of 15-20 per cent, and secondly, the data for rural areas show that the fertility decline was about 10 per cent, and an important finding relating to this decline is that a substantial effect was due to rise in fertility on account of fall in incidence of widowhood. As stated in the beginning this period was of sharp declines in mortality rates which have led to a significant declines in incidence of

widowhood ultimately leading to increase in fertility.

DEMOGRAPHIC TRANSITION: POST-1970 PERIOD

For the post-1970 period, the SRS is an important source giving information annually on crude birth rate (CBR), crude death rate (CDR) and IMR. The ASFRs are also available for all states for every year. This information forms a strong base for studying fertility transition. The only thing to be remembered is that the estimates for the beginning years might suffer due to under-registration. Table 3 gives the data on CBR and CDR from the period 1970-95. It shows that the decline in CDR is fairly smooth, coming down from about 12 per 1,000 to about 7 per 1,000. The trend in CBR is not at all smooth. It slides down from 32 in 1970 to about 26 in 1977, rises to 30 in 1984, and then starts declining again. As Kulkarni (1994) states, there are three phases of demographic transition [rather fertility transition] in Maharashtra. The first phase covers the period 1971-77, where the fertility declined mainly due to strong push to sterilisation programme during emergency period, the second phase (1977-84) shows the impact of setback to

the programme as the effect of excesses exercised during the emergency period, and the third phase (1984 onwards) is a normal period without excesses or setbacks. Table 4 describes the phenomena in quantitative terms.

It could be observed that the fertility trends are different for rural and urban areas. For instance, in case of both fertility measures, namely, CBR and TFR for rural areas, the decline for the first period (1971-77) is higher than the recent period (1984-91), while for urban areas the decline in CBR has reverse order and decline in TFR is same for the two periods. However, it also should be remembered that the estimates for 1971 could be underestimates. As Bhat et al (1984) have estimated, the CBR for 1971-80, according to SRS was 29.1, while estimated CBR was 31.2. Similarly, as argued by Srikantan and Balasubramanian (1994), the SRS estimates, especially for urban areas, were affected by the changed sample for the period around 1980-84. However, on the whole, it could be said that the fertility decline during 1984-91 was of a slower pace. Is this the universal phenomenon? It was observed that for Kerala, declines in the two periods were of the same order while for Tamil Nadu, the decline in the recent period was much sharper.

Under such circumstances, the question arises as to what could be the reasons for the peculiar trend in Maharashtra. Could family planning performance explain it or are there any other factors responsible? Table 3 also gives the data on couple protection rate (CPR) for the period 1970-94. It shows that the CPR for 1970 was 15 per cent and it increased up to about 31 per cent in 1976 leading to an increase of 16 percentage points. On the other hand, for the recent period it rose from 40 per cent to 54 per cent. Although we are aware that the relationship between increase in performance and decline in fertility would differ at different stages, it can definitely be said that there are other non-programme factors which would be responsible for the slower pace of decline during the recent period. Some clues could be obtained through the examination of age specific marital fertility rates (ASMFRs), which would go beyond the overall measures of CBR and TFR. Table 5 gives the ASMFRs for the years 1971-93.

It is clear that the women in younger age groups have not experienced declines in fertility; on the other hand, there have been significant increases in fertility rates. The sharp declines were observed particularly for the ages above 35. It is also observed that the decline in TMFR during 1984-91

was much less than that during 1971-77. If we examine the shares of different age groups in the fertility declines during the two periods, maybe, something more could be revealed. There are two main differentials between the pattern for the two periods. For the latter period, the increases and decreases for different age groups are larger, with concentration for the ages 20-34, while for the first period, the pattern is more of a spread out type. The age group for which increase in fertility was observed has shifted from 15-19 for the earlier period to 20-24 for the latter period.

These observations reflect a squeezing in effect. Further, higher increase in fertility for the latter period shows that the factors leading to increase in fertility have become more dominant. Improvement in health conditions of women and effects of modernisation could be the main reasons. The fantastic progress of MCH programme in Maharashtra supports the above conjunctures. Similarly, probably because of reduced lactation and relaxation of taboos on intercourse etc, the birth-intervals would have reduced and hence the squeezing effect. However, because of lack of direct information on these phenomena, the explanations would have remained at the level of conjunctures. But we have a golden opportunity to get to the root causes of the slower decline in fertility in Maharashtra, in the form of two statewide surveys conducted in Maharashtra in 1980 and in 1992. This is the period, when the process of fertility decline had slowed down. These surveys being mainly devoted to fertility and family planning, information is available in great details. In the next section, which concerns with the comparative scenario for 1980 and 1992, is expected to throw much light on the fertility trends in Maharashtra during the recent past.

NATIONAL FERTILITY AND MORTALITY SURVEYS

The National Fertility and Mortality Surveys (NFMSs) were originally planned to be conducted as a series of comparable demographic surveys in all the states in India. In the event, Maharashtra is the only state for which NFMS has been conducted so far as envisaged by the Population Research Advisory Council (PRAC).

The major objectives of NFMS, Maharashtra, were to estimate fertility levels and differentials among the three rural regions and the urban zones of the state; to examine the linkage between fertility and its proximate determinants such as age at marriage and contraception;

to identify and to assess the importance of socio-economic factors affecting fertility; to find the attitudes towards FP and its prevalence by methods and to estimate mortality levels and differentials by rural regions and urban zones, giving special attention to infant and child mortality.

In this survey data were collected from about 7,500 families spread over 100 villages and 104 urban blocks of the state. The field work was conducted during June to December, 1980, and the draft report was ready by the end of 1982. The survey, at all its stages, analysis and report writing was undertaken by the Population Research Centre (PRC) of the Gokhale Institute of Politics and Economics, Pune.

For comparable state estimates in the NFMS, the PRAC of the government of India had recommended that about 1,200 families should be interviewed for every 11 million population. On this scale, the Maharashtra survey was expected to obtain about 6,000 interviews. Moreover, for each domain of study, the sample should be large enough to provide separate estimate. The present survey was expected to yield estimates for the three rural regions of Aurangabad division, Nagpur division and western Maharashtra and for urban centres other than Greater Bombay, and Greater Bombay. A total of 7 654 families were contacted. The distribution of the sample

families was roughly in proportion to their population. In selected families, all married women in the reproductive ages of 15-50 were interviewed. This resulted in 8,874 interviews of eligible women. The *de jure* members of the family usually living and eating together were defined to be the family unit. For instance, a woman visiting her parents' home for delivering her baby was to be included in her husband's family, if it fell in the sample. Fifty families each from the selected villages and 25 families each from the selected urban block were to be selected.

Two questionnaires were used in this survey. One was for the selected family and the other was for the eligible woman in the family. The family questionnaires seek information on the general characteristics of the family such as caste and religion, principal and subsidiary family occupation, income, migration status, living condition and possession of consumer goods. The other questionnaire contained detailed information about the eligible couple, fertility history, information about knowledge, attitudes and practice of family planning, ideal family size, etc. Two sections of the questionnaires were meant for women who had a delivery during five years preceding the survey. In this section, questions were included regarding place of delivery, location, post-partum amenorrhoea and immunisation.

The analysis was directed towards the following major topics: comparison of the demographic profile of Maharashtra from NFMS with census; background family characteristics; current birth, death and growth rates; age distribution; age at marriage and fertility differentials of currently married women; FP attitude and practice; indirect estimation of fertility and mortality specially infant and child mortality and the assessment of the quality of data.

NATIONAL FAMILY HEALTH SURVEY

The National Family Health Survey (NFHS) Maharashtra, 1992-93 was undertaken with the principal objective of providing state level and national level estimates of fertility, infant and child mortality, the practice of family planning, maternal and child health care and the utilisation of services provided for mothers and children. The NFHS in Maharashtra was expected to cover 4,000 eligible women. Assuming the non-response rate at 12 per cent, a sample of 4,400 households was drawn. Finally, 4,063 households and 4,106 eligible women were contacted.

Three types of questionnaires were used in the NFHS: the household questionnaire, the woman's questionnaire and the village questionnaire. The household questionnaire seeks information about usual members and visitors, household amenities, data on births and deaths during preceding two years and information on whether any member of household suffered from tuberculosis, leprosy, blindness, malaria or any physical impairment during preceding three months. This information was collected for the usual residents of the households as well as the visitors.

The woman's questionnaire was used to collect information from eligible women, i.e., all ever-married women aged 13-49 years including visitors as well as usual residents. The questionnaire seeks information on respondents' background, reproduction, contraception, health of

children (under four years), fertility preferences, husband's background and woman's work, height and weight of

children under four years and knowledge about AIDS. The village questionnaire was used to collect information on the villages selected in the NFHS sample. It collected information on various amenities available in the village including electricity, water, transportation, and educational and health facilities.

The description of the two surveys was given in detail to enable the reader to probably judge the quality of the data. It is quite clear that the conduct of the NFHS was more systematic and more rigorous in comparison with NFMS. It should be recalled that NFMS, 1980 was conducted single handedly by the PRC, Pune while NFHS involved three agencies, namely, the PRC, IIPS and the CO. There are merits and also demerits of both of these procedures. With a single agency doing the work, uniformity and consistency can be maintained. On the other hand, number of agencies coming together to conduct the survey could lead to problems arising out of differences in understanding. Particularly, the CO, in every case were not knowledgeable people as far as demographic surveys are concerned and hence did not have an insight into demographic data, while organising such a massive survey. In addition, the CO for Maharashtra was from Hyderabad and hence was not familiar with the demographic and related trends in Maharashtra. This could have affected the office editing of the questionnaires done in the CO's office at Hyderabad. However since utmost efforts were taken to maintain the quality of the information, the above-mentioned factors might not have contributed appreciably. On the other hand, for NFMS, 1980, since the conduct of the survey, processing of the data and report writing was done by a single agency - the PRC, Pune, knowledgeable in demographic surveys, there seems no risk of committing mistake on account of ignorance.

HOUSEHOLD CHARACTERISTICS

Housing characteristics such as source of drinking water, lighting facility and sewerage facility are discussed (see Table 6). It is interesting to note that the percentage of households getting tap water has nearly doubled. The progress in rural areas is remarkable; the percentage of families with tap water has increased from 12 to 67. The progress in the availability of electricity is also of a similar order. However, if we look at the figures for latrine facility, we come across an equally remarkable failure. The percentage of households with 'no latrine' has increased for urban areas and has declined only

slightly for rural areas. The worsening of living condition in Greater Bombay which accounts for nearly one-third of the urban population of Maharashtra is the reason for deterioration of urban areas. Further NFMS data showed that the percentage of households with 'no latrine' was about 17 percent for Greater Bombay and 4 percent for the other towns of the state.

There are two proxy variables which could give an idea about the economic standard of the household: the occupation of the family/head of the household and the ownership of assets such as land and consumer durables. Both the surveys have information on these. But for reasons unknown, the NFHS has not even tabulated the information on occupation. Thus, we remain with only the ownership of assets as the indicator of economic conditions (Table 6). The percentage of households with no land and land less than 6 acres has increased. This shows that ownership of land, a rural asset is gradually declining. On the other hand, the ownership of consumer goods such as car, TV, refrigerator has tremendously increased, even in rural areas. The percentage of households owning these goods has increased from a negligible 1 percent to 11 percent in rural areas. This increase obviously is due to the ownership of TV. The aggression of the electronic mass media could be helpful in educating the people, if utilised properly. However the other stuff that is shown on the TV, is so glaring that it could wipe off the one-two minute long educational messages.

Age distribution: The information on the age distribution of the two surveys is useful not only for assessing the changes indicative of fertility decline, and change in the proportion of eligible women, but also for checking age reporting. As Bhat (1995) argues, "In most fertility surveys there is a tendency to move women out of the eligible age range (13 to 49 years in NFHS) to reduce the workload of the interviewer. But in the NFHS, there is an irregular dip in the age interval 50-54, which the survey takers attribute to over compensation that resulted from the warnings issued to enumerators against such a practice. However, a careful examination of the NFHS data suggests the presence of continuous under reporting in the age range 10-45 that resulted perhaps from a tendency of transferring women out of the lower end of the eligibility range."

Bearing the probable effects of errors in age reporting, if the age distributions are compared, we arrive at the following conclusions. There is no change in the

TABLE 9: CONTRIBUTION OF FERTILITY DECLINE BY FOUR COMPONENTS, 1970-82

Variable	Effect
Proportion of women in reproductive ages	$GR_1 (W2/P2 - W1/P1) = 0.001394$
Age structure	$(\sum (A_{2i} - A_{1i}) M_{1i} F_{1i}) W1/P1 = 0.000871$
Marital status composition	$(\sum A_{1i} (M_{2i} - M_{1i}) F_{1i}) W1/P1 = -0.000878$
Marital fertility	$(\sum A_{1i} M_{1i} (F_{2i} - F_{1i})) W1/P1 = -0.004489$
Total effect	$= 0.001394 + 0.000871 - 0.000878 - 0.004489$ $= (-) 0.003102$ or 3.102 per thousand

proportion of population in the age groups 0-9. It is recalled that the population in ages 0-9 for 1992 is the survivor of 1982-92, while for 1980, it is 1970-80. The trend of birth rates in Maharashtra has shown that the decline in birth rate 1970-80 was sharper than that of 1982-92 and hence 'no change' in population 0-9 could be expected. The proportion of population in the age group 10-14 shows a decline for both rural and urban areas. This population in 1992 is a survivor of the births in 1977-82, while for 1980 it is the survivor of births during 1965-70. The birth rate for 1965-70 was naturally higher than that for 1977-82 and hence the decline in the percentage. There is not much change in the proportion of population above age 60.

Nuptiality: Marriage is of particular interest, not only because of its importance in its own right, but also because of its influence on fertility and population growth. Marriage patterns are also important from a sociological point of view and they are inextricably linked to the status of women in the society.

The changes in the nuptiality pattern during 1980-92 will be examined through simple measures such as proportion married in different age groups, the singulate mean age at marriage and the average age at marriage. After examining the trends, the trends in the differentials according to education and caste/religion also will be assessed. The changes, if any, in the differentials are important for our study, since they demonstrate the progress in different social groups.

If we analyse the proportion of married women for different age groups for both rural and urban areas, it is seen that except the age group 15-19, for all other ages, the proportion has declined, which is an expected trend. However, it is surprising to note that the youngest age group 15-19, which is expected to show the maximum change, is not showing any change. To the contrary, it is showing slight increase in the proportion for both rural and urban areas. Although the period of 12 years may not be long enough to expect significant change in the marriage age, which increases very gradually, 'no change' in the youngest group is not expected. As discussed earlier, it was observed that the age of women reported in NFHS (for women aged 15-30 years) is, on an average, an year less than the actual age. This means that if 36 per cent of women aged 15-19 are married, the percentage actually refers to 16-20. Examination of the steep rise in proportion married in the younger ages indicates that an error of 0.5-1 year may lead to a

significant adjustment in the proportion married. For example, according to NFHS, the percentage married is 6.5 for the women aged 13-14 years, 36.5 for women aged 15-19 years and 78.3 for women aged 20-24 years. If we plot the trend, plotting 36.5 against 18.3 (assuming under reporting of 0.8 years) and not against 17.5 and similarly plotting 78.3 against 23.5 and not 22.5, and then read off the percentage for 17.5 and 22.5 representing the age groups 15-19 and 20-24, we find that they are 30 and 75, respectively. With adjusted figures for proportion of married women, the age at marriage rises by 0.7 years. The error due to misreporting of ages in rural areas is of one complete year. Thus, we could say that the age at marriage of women in rural areas would rise by an year. For urban areas the adjustment is not of a significant direction and order. Hence, we presume that there is no significant mis-statement of ages in urban areas.

With the above adjustments, one could come to the conclusion that the average age at marriage which was 16.6 years in 1980, has increased to 17.0 (median age at marriage) and has not declined to 16.4 as per the report of the NFHS. Further, the age at marriage for rural women also would be corrected to about 16.3 instead of 15.3 years. This would reduce the rural-urban gap. The singulate mean age at marriage which showed a very meagre increase of half an year from 1981 to 1992-93, also would show some appreciable increase, if adjusted for mis-statement of ages.

Differentials by caste, religion and education: Assuming justifiably that the mis-statement of ages would be similar for all groups of the women, the differentials are examined below. Table 7 gives the data on differentials from NFMS and NFHS. The analysis being different in the two surveys, strict comparison is not possible. The NFMS report gives the differentials in terms of percentage ever married, while the NFHS report provides in terms of median age at marriage. The median age at marriage was same for Hindus and Muslims for the age group 20-24 in 1992, while in 1980 the percentage ever married for Muslims was lower than the majority of the Hindu castes. So far as the caste is concerned, the 1980 report shows that there was not much difference between percentage ever married for the ages 20-24 (84.3 per cent for other Hindu castes and 89.7 per cent for SCs and STs). On the other hand, the NFHS report has shown that the median age at marriage for SC/ST was 15.4/15.5 and that for the other castes was 18 years. It is interesting to observe these contrasting observations.

Though the Hindu-Muslim differentials have been wiped off, the caste differentials have widened.

It is found that in 1980, the proportion ever married for the age group 20-24 declines from 96 for illiterates to 87.6 for women educated up to seventh standard, and declines further to 59.5 for women with educational attainment above 8th standard. It means that the attainment of education beyond 7th standard makes the real difference in marriageable age. On the other hand, the difference in median age at the marriage for women in the age group 20-24 as revealed by the NFHS reports show that the progressions from illiterates to middle school and from middle school to the higher educational grades are equally important. It is observed that the median age at marriage for illiterates is 15.1 years, while that for women with middle school is 17.7 and for women with higher education, it is definitely higher than 20 years. These observations indicate that during the period of study, the tendency of marrying at a little higher age has developed even among the illiterates and less educated. In brief, the age at marriage is not that static as was revealed by the reported figures of NFMS and NFHS.

Regional variations: The NFMS has collected valuable information on regional variations. It would have been possible to compare the regional differentials, if the NFHS sample would have been adequate enough for regional estimates. However, an attempt is made to examine the changes in the regional variations with the help of data on evaluation surveys conducted by the PRC, Pune in rural areas of various

TABLE 11: MEAN NUMBER OF CHILDREN EVER BORN BY EDUCATION

Urban Maharashtra	25.5	25.0
Entire Maharashtra	30.4	29.0

districts of Maharashtra during 1980-92. The PRC, Pune, has carried evaluation surveys in Nasik, Solapur, Pune, Sindhudurg and Nanded districts. The surveys had a sample of about 2000 households each. Except Nanded, the other four districts are from western Maharashtra, while Nanded is from Marathwada region. It is observed that unlike Marathwada, the western Maharashtra and Nagpur division (Vidarbha) show similar trends. Our evaluation surveys have not covered any district from Vidarbha, and hence comparison could not be made for Vidarbha. But the above observation may enable us to have some broad conclusion on the basis of the trends in western Maharashtra. It is seen that Sindhudurg resembles the position of Kerala among the states of India. Western Maharashtra includes other developed districts like Sangli, Satara and Kolhapur, which are close to Pune district. It means that the proportion of married women, especially in the ages 15-19, which is an indicator of nuptiality, would be definitely lower for them for the recent period than that found for western Maharashtra in 1980. This observation suggests that the conditions in western Maharashtra are rapidly changing while there is no change in Marathwada region. Disparity by regions also could be one of the probable reasons for the slow progress in demographic transition in Maharashtra.

FERTILITY AND RELATED VARIABLES

A major objective of the NFMS 1980, and NFHS 1992, conducted in Maharashtra, was to estimate fertility levels in rural and urban area of Maharashtra. Detailed information was collected about current and past fertility levels, cumulative fertility, differentials by socio-demographic characteristics, birth intervals, postpartum-amenorrhoea, etc. The information on births during the reference period of two years and the birth history of women formed the base for calculating the fertility indicators such as CBR, ASFR, TFR, etc.

In case of NFMS, two types of adjustments were done, while calculating the birth rate. Firstly, because of the selection of voter's list as a sampling frame, a bias had arisen in the selected sample. Thus, to remove the effect of this bias, weights were applied to each household. Secondly an estimate of 'response error' was obtained on the basis of re-interviews in 44 villages and 33 urban blocks and this was added as a correction factor. The correction for response error could not be applied to ASFR, ASMFR or TFR. The weights for removing the bias of the

sampling frame were however applied for calculating the age-specific rates. The different estimates of CBR and TFR at the two surveys and SRS are given in Table 8.

Out of the various estimates of CBR for 1980, the one (adjusted and corrected for response error) which should be compared with the NFHS estimates, based on the individual woman's birth history, one could say that the CBR has declined from 30.4 to 26.7 for the entire state, meaning thereby that it has declined by about 12 per cent. This decline is about 14 per cent in rural areas and 4 per cent in urban areas. For comparison let us examine the CBR from SRS. It is seen that the NFHS rates are very close to the SRS estimates, while the NFMS rates for 1980 are higher than the SRS estimates. The SRS rates compare well with the weighted rate based on household information.

A better picture of fertility can be obtained by examining the ASFR and the TFR, which are not affected by the age structure of the population. For NFHS, the ASFRs and the TFRs are based on births during the three-year period preceding the survey, while for NFMS they are based on the births during the reference period of two years (see Table 8). It is noticed that the decline of TFR is 24 per cent in the entire state, of about the same order in rural areas and 14 per cent in the urban areas. The order of decline in TFR is much higher than the decline in the CBR. This shows that at the individual level, fertility is declining but is not reflected in the decline in birth rate.

These observations lead us to two kinds of analyses. One is directly relating the contribution of different factors explaining the decline in birth rate and the other

relates to examining the decline in TFR in Maharashtra in comparison with those found in other states and judging its adequacy. It is observed that Andhra Pradesh, Himachal Pradesh, Karnataka, Punjab and Tamil Nadu had TFR (1979) close to TFR of Maharashtra, i.e. 3.6 per woman. If we examine the decline in TFR in these states it is found that except in Karnataka, it is higher than that in Maharashtra. Tamil Nadu especially has shown a very sharp decline. In short Maharashtra, as could be seen from the latter section on family planning, though being a best performing state and having a high level of female literacy, has not been successful in reducing its birth rate. Some clues could be obtained from the 'decomposition' of birth rate decline into various factors using the standardisation technique.

DECOMPOSITION OF FERTILITY DECLINE IN MAHARASHTRA, 1979-91

The standardisation technique was applied to both the NFMS 1980, NFHS 1992. It is recalled that the estimate of CBR for 1980 was 28.5. However, when the data were taken from individual cards and adjustments were made, the estimate of CBR comes up to be 29.8. The NFHS reports that the birth rate was 26.7 per 1000. Thus, we have to explain the decline of 3.1 points in terms of the four components, namely, the proportion of women in the reproductive age span 15-49, the age structure of the women within the reproductive ages, the proportion of married women and the ASMFRs.

The proportion of women in the reproductive age span has increased from 23.1 per cent to 24.2 per cent. The changes in this parameter occur on account of changes in fertility and improved survival. Increase in this ratio leads to a positive effect on fertility. The changes in the age structure are not significant. As far as the marital status composition is concerned, it is expected that the proportion of married should decline more sharply in the younger ages. But surprisingly it is observed that there is no change in proportion of married for the youngest age group, i.e., 15-19, and also the decline is not remarkable for the next age group too. It was observed that there is no change in the age at marriage during the intervening 12 years. If the age at marriage increases, it reduces the proportion of married couples in the population, while with improvement in health condition, the incidence of widowhood declines, giving rise to the increase in the proportion of married couples. This ratio was 165 per 1000 in 1980 and has increased to 169 in 1992. It means that the effect of reduction in widowhood has outweighed the effect of increase in age at marriage. In short, the changes in the nuptiality pattern are in the direction of increasing the fertility. Lastly, the most important component, i.e., age specific marital fertility rates has to be examined. It is observed that for the first age group the ASMFR has actually increased and for the second age group the decline is as good as none. In fact, the age group 20-24 is the one with peak fertility. Hence if the women in this age group use family planning methods in large proportion, sharp decline in fertility could be expected. The increase in the marital fertility rate for the first age group is remarkable and equally not expected. Although explanations can be given for this phenomenon in terms of improvement

in women's health, leading to reduction in foetal losses, withdrawal of taboos, reduction in breast feeding, etc., the amount of increase observed in this case may go beyond the effect of above factors. In this connection, it is necessary to look into other probable reasons.

Bhat comments, "A careful examination of the NFHS age data suggests the presence of continuous under-reporting of age in the range of 10-45 that resulted perhaps from a tendency of transferring women out of the lower end of the eligibility range. In reproductive ages, the proportion of female population reported above any age is consistently smaller in the NFHS than the SRS. The deficit of females in the NFHS indicates that there was a net downward transfer of females across the age in the surveys. The average age difference shows that in the reproductive ages, the NFHS women at a given age are older by about a year than the SRS women reported at that age. Because the NFHS women are older, they have higher parities than the SRS women at the same reported age. Although the estimated age difference may be small, it could still be critical at younger ages because of the steepness of the fertility function at these ages. If the NFHS fertility rate for ages 15-19 years actually refers to ages 16-20, it could easily explain a 50 per cent rise in fertility." If we assume Bhat's argument to be true, we would be able to explain the unexpectedly high fertility rate for the ages 15-19. If an adjustment for 50 per cent rise is made,

the adjusted ASMFR for 15-19 would be around 275, which would seem reasonable and its difference with 1980 figures could be explained by the factors mentioned earlier.

However, for the purpose of decomposition, the reported rates only are used since the adjustments cannot be probably done in exact terms. The effects of the four components contributing to fertility decline (measured as decline in birth-rate) during 1979-81 are given in Table 9. Coincidentally the observed change is also 3.1 per 1000. Thus it appears that the observed change is entirely explained by the four factors.

In this context, it would be worthwhile looking into any other studies on fertility transition in Maharashtra, which are based on the other sources such as SRS [Srinivasan 1994; Kulkarni and Kumar 1995]. According to Srinivasan, there was a decline of 7.5 points in the birth rate for Maharashtra during 1972-89, out of which 5.9, that is about 78 per cent of the decline that was explained by the four components. The decline in marital fertility explained 89 per cent, the changes in age structure 10 per cent and changes in marital status composition explained 33 per cent. The changes in the proportion of women in reproductive ages led to a positive contribution of 55 per cent. The contributions do not exactly compare with our findings but it is not also expected, since firstly the period is different, longer and the explained decline is only 75 per cent. It is presumed

Total	31.0	2.5	46.2	6.3

that the unexplained part could be explained with the help of interactions but sometimes this unexplained part has assumed fairly large amounts. For instance in Karnataka, only 57 per cent of the decline is explained. In our opinion unless the explained contribution is above 90 per cent, nothing can be said about the role of various factors with confidence.

Kulkarni and Kumar's study (1994) for Maharashtra divides the period 1971-91 into three phases of transition - 1971-77, 1977-84 and 1984-91. Although, the data reveals that these three periods show clearly distinct trends, namely, a sharp decline during 1971-77, increase in fertility during 1977-84 and then a gradual decline during 1984-91, in our opinion the sharp decline in fertility up to 1977, particularly during 1976 and 1977 and the subsequent increase thereafter are not natural events, and hence, we wonder how far such demarcations would be proper.

Another comment on studies using SRS estimates would be that SRS rates during 1970s suffered from underestimation. When special techniques are applied to measure the contribution of different factors, the extent of coverage has to be of similar order at the two points of time. The third phase 1984-91 in the study by Kulkarni and Kumar seems to be free from both the errors mentioned above. Further it also compares with the period covered by NFMS and NFHS.

DIFFERENTIALS IN FERTILITY

After describing the trends in fertility, let us examine the differentials in these variables revealed by the two surveys. As mentioned earlier, the NFMS analysis is presented mostly in terms of CBR and mean parity and hence the differentials for 1980 would be examined in terms of CBR and parity, while the NFHS differentials would be examined in terms of TFR and parity. Table 10 gives the data on CBR differentials by caste and religion for 1980 and TFR differentials for 1992-93. The notable finding that emerges from this comparison is that the Hindu-Muslim differentials have increased quite significantly. It would be clear from the section on family planning performance, the programme has been performing at almost the same level in rural and urban areas and there is very little differential in the performance of various castes but the differential between Hindus and Muslims is still very wide. Under the garb of personal law, the Muslims are desisted from using contraception and hence, the wide gap. Even for differentials by residence and caste, it could be said that

they should have reduced over time with the expectation that as the FP programme progressed, it should cut across all the demarcations in this society. In Table 11, mean number of children ever born has been compared for women with different educational attainments from the two surveys. Although the educational categories are slightly different, a broad comparison is possible. It is found that the trends are similar. Not only the trends but also the values of parities do not differ much between the two surveys.

Regional variations: On the basis of the proportion of urban and rural population, some rough estimates were obtained for birth rates of rural areas using Bhat's estimates. It was observed that the rural areas of western Maharashtra had a birth rate of about 27 per thousand population, Marathwada had a birth rate of about 36 and Vidarbha about 29 in 1987. Compared to the NFMS estimates in 1980, these estimates show different orders of decline.

The above estimates fairly tally with the estimates we had obtained from our surveys for some districts. The average birth rate for western Maharashtra from our surveys was 28.3 for 1985-88 and for Marathwada it was 34 for 1989. Our survey of the Marathwada region shows that the region is lagging behind the other regions on both counts - the demand for FP methods and the efficiency of provision of FP services.

the surveys in respect of knowledge, practice, source of supply, the characteristics of the acceptors, reasons for non-use, future intentions, etc.

It is needless to mention that R D Karve from Maharashtra was the pioneer of the FP programme in Maharashtra. In 1970, Maharashtra occupied second position in FP performance next to Punjab with 17 per cent of the women being acceptors. However, from 1974 to 1985 Maharashtra stayed at the top with more than 50 per cent of the couples protected. It was followed by Punjab, Haryana and Gujarat. In our judgment with the introduction of cu-T in the programme, Punjab surpassed Maharashtra. Also Kerala and Tamil Nadu surged ahead as Maharashtra lost its rank during last 10 years. From the data for 1980-92, the slow progress of the FP in the state can be gauged.

In 1980, the percentage of protected couples was 33.4, which has increased to 52.5 in 1992-93. In 1980 the urban performance was slightly better than the rural performance (Table 13). But in 1992, thanks to the efficiency of the FP department and its network of PHCs, the rural performance has surpassed the urban one. Still after 12 years, the contribution of spacing methods is not remarkable. The performance in spacing has increased from 2.5 to 6.4 only. As a check on the quality of data let us compare these figures with the service statistics. According to the service statistics the percentage of couples protected was 34.5 for 1980 and 55.2 for 1992. The differences between service statistics and surveys are not significant. However, if we examine the prevalence by methods, the differences widen. For example, the performance of sterilisation

FAMILY PLANNING

Information about FP and use of contraception is of practical use to policy makers and programme administrators for formulating policies and strategies. Detailed information was collected in both

TABLE 18: REGIONAL ESTIMATES OF FAMILY PLANNING ACCEPTANCE

BCG	25.7	70.5	39.5	87.2	86.3	86.9
Triple	17.3	39.1	23.8	81.6	84.1	83.1

is 46 per cent according to the NFHS, 1992, while service statistics report it as 41 per cent and the performance of spacing methods is about 6 per cent according to survey and 14 per cent according to service statistics. The reasons are obvious. The incompleteness in registration of sterilisation carried out in private sector in the service statistics, while the over-reporting of use of spacing methods in the service statistics is an established practice [Visaria, Visaria and Jain 1994; Zachariah et al. 1999].

Having assured ourselves about the genuinity of the reported performance, it would be interesting to examine the trends in other related characteristics. The 1992-93 NFHS shows that female sterilisation is the best known, followed by male sterilisation, IUD, oral pill and lastly the condom. In 1980, the levels of knowledge were quite low (15-20 per cent) for spacing methods. During 12 years, the levels of knowledge have risen remarkably. But it is surprising to note that the simplest contraceptive like the condom is known by only 57 per cent of the women. The simple reason behind this is that it is a male method, while most of the FP acceptors happen to be females.

Regarding the source of supply it was observed that in 1980, 75-80 per cent of the users of condom and oral pills had bought these from the chemist, while in case of IUD the contribution of private hospitals was 60 per cent (Table 14). In 1992, the contribution of the private sector in case of condom has remained same, while for oral pills and particularly for IUD the role of government has increased. Both these observations indicate the government's increasing role towards propagating female methods of FP. In case of sterilisation the share of private sector has increased from 15 to 20 per cent. Even in urban areas the share has not increased significantly indicating that currently, the government is the main caterer to needs of FP despite people fast losing their faith in the government.

Characteristics of the acceptors: Since 1980 the proportion of users of spacing methods was very low, the report contains detailed information about only sterilised couples. Hence the comparison of the characteristics would be done only for the sterilised couples. The age at sterilisation and the number of the living children at sterilisation are important to indicate the probable impact of the performance. In 1980, only 15 per cent of the sterilised couples had wife's age below 24 years. This percentage has increased to 45 per cent. The median age at sterilisation has

come down from 30 years to 25.6 years. This points towards a substantial decline in fertility as a result of adoption of terminal methods at a younger age. However, this would be true only if a similar trend is observed in case of number of living children at sterilisation.

In 1980, the percentage of sterilised couples with more than 3 children was 90, while for 1992 it has reduced to 80. This reduction is not as impressive as the reduction in the median age at sterilisation. What are the reasons for such lack of consistency? Clearly, the norm about desired number of children and that too sons, has not have reduced. As regards the distribution of sterilised couples by number of sons, we find that in 1980, the percentage of sterilised couples with one son was 19 and it has increased to 30. But at the same time, the percentage of sterilised couples with no son was 2.4 and has increased to 3. These figures clearly indicate a preference for son. In this connection, some additional information regarding the sex-composition of the children of the sterilised couples was compiled for the two surveys and is given in Table 15.

In 1980 among couples with only one child the percentage of the sterilised was 3.4, while the percentage of the sterilised having one son was 4.3. These percentages for 1992 have become 5.8 and 8.6 respectively. The percentage of the sterilised with two children was 16.6 in 1980 and has increased to 37.4 in 1992. The increase is substantial. But if we examine the data with respect to sex-composition of children, we find that the increase is almost contributed by increase in the proportion of the sterilised with two sons. The proportion of sterilised couples with two sons has increased from 21.6 to 55.2. The same for two daughters has increased only from 6.8 to 9.5. The tremendous gap between the performance with sons and daughters patently discloses the preference for son in Maharashtra. This could be the condition in other states also [Irudaya Rajan, Mishra and Vinala, 1996]. Hence, we looked into the NFHS data for all other states and when we compared our data with those for a state like Tamil Nadu, which has a similar fertility level in 1980 and has many other characteristics like female literacy of similar order as that of Maharashtra, we were surprised to find that in Tamil Nadu, the percentage of the sterilised with only two sons was 50, while that with only two daughters was as large as 30. Why should Maharashtrians long for sons so intensely? In this connection we would like to draw attention to various conjectures put forth

by different demographers for the recent success in Tamil Nadu. Some of them explain it in terms of social capillary theory. The high aspiration about children lead the parents to keep the family size under control and these aspirations might be a fall out of the exceptionally large proportion of Tamilians watching movies, which present omnipotent heroes. We do not quite agree with the 'movie hypothesis' but the combination of aspirations coming out of higher literacy and poverty representing the incapability to bring up bigger family could have led to the rising acceptance of FP. In this context an interesting study by Krishnamoorthy and others (1996) based on focused group discussions and indepth interviews looks for the causes of fertility transition in Tamil Nadu. The discussions do not indicate any significant role for political mobilisations. Rather aspiration for good quality of life for children seems to be the answer. Different groups in the society aspired for small families for different reasons. The urban upper classes tried to maintain their social and economic status against the social awakening caused by the Dravidian movement and the reservation policy of the government in education and employment. The large middle class, because of better transport network could get access to the benefits of development and hence aspired for few educated children against more uneducated children. Lastly, for those in the lowest rung, awareness about their rights and opportunities for upward mobility, made it necessary to limit the family size.

Bhat (1995) has explained the Tamil Nadu phenomenon not in terms of lack of preference for son but the fear of begetting daughters in the process of waiting for a son. The exorbitant dowries and the cost of education of a girl naturally creates such fears and hence leads to termination of childbearing at lower parity. On the other hand the situation in Maharashtra is quite different. The rural areas of Maharashtra might be better than the rural areas of Tamil Nadu and dowry is not a stumbling block in settlement of marriages. Hence, the Maharashtrian couples can afford to bear daughters before begetting a son. According to Arnold's measure of excess of births due to gender preference, Maharashtra stands at 14.6 per cent, while this measure is about 6.8 per cent for the south Indian states. The measures for Punjab, Haryana and Himachal Pradesh are above Maharashtra. To sum up, though the performance of FP has risen substantially, in quantitative terms, it has not improved qualitatively.

In continuation of our efforts to explain the decline in fertility during 1980-92, we have applied Bongaart's model of proximate variables. Bongaart's has demonstrated that 96 per cent of the variance in the fertility levels is explained by four proximate variables: *em* – the proportion of married females; *ce* – the prevalence of contraceptive use; *ca* – the incidence of induced abortion; and *cl* – the fertility inhibiting effect of breast feeding.

In this formulation, the TFR is expressed as the product of four factors and the total fecundity rate (TF). We have applied this model to data for both 1980 and 1992 and have tried to assess the relative contribution of different variables. In absence of data on induced abortions we have assumed no change in the effect on account of induced abortion. Table 16 gives the results. It is observed that the decline in fertility due to contraception is substantial but is counteracted by the increase in fecundity rates represented by TF. The TF has increased from 11.2 to 14.6. These estimates are not foolproof since the model has limitations and the effect of induced abortions has not been considered at all. But in our opinion, since the changes in factors giving rise to increase in natural fertility have been observed in Maharashtra there is a possibility of increase in TF. For instance, although it could not be proved with evidence, the incidence of spontaneous foetal losses must have reduced, giving rise to increase in the number of live births. Bongaart's model takes into account only the induced abortions with a view to consider the contraception among the women with induced abortion.

Further, the reduction in post-partum amenorrhoea, which to an extent is represented in the index of lactational infecundity, would also give rise to exposure to conception and hence the value of TF. On the basis of NFMS and NFHS we would get some account of the decrease in the duration of post-partum amenorrhoea. It is observed that the duration has decreased from 11.8 months to 8.5 months. In short, there are some factors which give rise to increase in fecundity rate and which have shown significant changes over time. The application of Bongaart's model has shown that there are some factors which have led to rise in the fecundity of the women. In brief, the in-built momentum for maintenance of fertility levels has counteracted the efforts for decline in fertility and hence visible decline in fertility in Maharashtra appears to be low in view of substantial contraception.

In this context, the question arises as to how Tamil Nadu at same level as of Maharashtra did not face problems due to fertility inhibiting factors. Kulkarni (1995) has applied Bongaart's model to the data for Tamil Nadu for the period 1983-92, and arrives at implied values of TF as 11.1 and 10.9 births per woman, implying that there is no counteracting force against decline in fertility. We do not have any direct evidence in support of this observation. But we would like to argue out the case of negligible decrease in foetal losses in Tamil Nadu. As against six per cent foetal losses and still births for Maharashtra, Tamil Nadu has this percentage around 11. Similarly the proportion of infecund women is higher in Tamil Nadu. If infecundity is defined as the proportion of childless women of ages 40-49, then it is 3.1 per cent for Tamil Nadu and 1.8 per cent for Maharashtra. Thus, as a conjecture, we could say that the apparent failure of Maharashtra as against the success of Tamil Nadu could mainly be due to the differential nature of the fertility inhibiting factors in the two states. It does not mean that there is no scope for improvement in the FP programme in Maharashtra. Efforts should be made to motivate couples to reduce their preference for son. There could be doubts as to whether this comes under the activities of the family planning programme but its HIC component could be directed towards this. Unless the son preference reduces, significant progress in the performances does not seem to be a possibility in near future.

DIFFERENTIALS IN FAMILY PLANNING PERFORMANCE

The trends in the differentials in family planning acceptance for different groups would reveal the changes in the spread of FP programme in various strata of the state. The three prominent social characteristics are religion, caste and education. The differentials by caste and religion and changes over time reveal the hold or absence of it, of the social institutions while the changes in differentials by education would show the changing influence of education on acceptance of FP methods (see Table 17). Generally younger women are more educated but since they have yet to complete their families, they do not use family planning. The older women, who on the other hand have completed their family sizes, lack knowledge and awareness. This pattern changes with rising use of spacing methods and awareness among illiterate women. In Maharashtra both these developments

have taken place and hence we do not find any difference between prevalence rates of illiterates and educated.

As far as the effect of religion is concerned, the gap between Hindus and Muslims has widened. The ratio of CPR for Hindus to Muslims has increased from 1.38 to 1.57 during 1980-1992. In any development programme, as it proceeds, all the lagging groups get involved and the disparity reduces. In case of Muslims, the gap widens, showing that Muslims have not been sufficiently involved in the programme. There is no need to elaborate on the reasons for this observation. Interestingly, the caste differentials with regard to FP have reduced over time. The scheduled castes have come on par with other castes, while scheduled tribes are somewhat behind in an option of FP methods. The ratio of CPR for other castes to that of the tribes has reduced from 1.26 to 1.09. In this context let us examine the trend in regional variations. Since in Maharashtra the differences between rural and urban performance are not wide, we can compare the rates for rural areas in 1980 with rates for entire areas of 1992.

Regional variations: To repeat, the NFMS has given estimates by rural region and urban zones. If we could get the estimates of contraceptive prevalence by region for 1992, it would indicate the regional progress in the field of contraception. The evaluation and intelligence division of the ministry of health and family welfare has given estimates for districts of couples effectively protected (see Table 18). It is seen that the regional gaps have been reduced as far as practice of contraception is concerned. Thanks to the bureaucratic efficiency, the services have reached even in the interior areas of Maharashtra.

Maternal care indicators - ante-natal care: Ante-natal care refers to pregnancy related health care provided by a doctor or a health worker in a medical facility or at home. Ante natal care can contribute significantly to the reduction of maternal morbidity and mortality because it includes advice on diet and the provision of iron and folic acid tablets to pregnant women. In the NFHS each woman who had a live birth during preceding four years was asked details about the health workers' ante-natal visits. The number of ante-natal care visits and timing of the first ante-natal check-up are important for the health of the mother and outcome of the pregnancy. Ideally, for normal pregnancies, ante-natal care visits after confirmation of pregnancy should be scheduled at intervals of four weeks until the last month and weekly

thereafter. However, it is often difficult to observe this schedule. Under these circumstances, a minimum of four ante-natal visits are recommended, one each during the third, sixth, eighth and ninth months of pregnancy.

In India, the tetanus toxoid immunisation programme for expectant mothers was initiated in 1975-76 and was integrated with the expanded programme on immunisation (EPI) in 1978. In 1986, the universal immunisation programme was started with an important objective to protect all pregnant mothers against tetanus. Provision of iron and folic acid tablets to pregnant women as prophylaxis against nutritional anemia forms an integral part of MCH activities in India. It is recommended that a woman should take 100 tablets of iron and folic acid during pregnancy and the health workers are instructed accordingly. In NFHS, detailed information was collected regarding place of delivery, attendance at delivery, ante-natal visit, etc. But NFMS, 1980 had very limited information on items, regarding registration for ante-natal care, reason for no registration and visits by the government workers (see Table 19 for details).

In 1980, in rural areas where only 16 per cent of the women had registered, only 1 per cent of the cases the government workers had paid visits. Further, the main reported reason for no registration was 'no need' in case of 50 per cent of the cases. For urban areas the percentage of registered cases was as high as 83. In 1992, the picture has changed altogether. Thanks to the UIP, even in the rural areas, 78 per cent of the women are getting antenatal care, while in urban areas, 90 per cent of women getting ante-natal care. In short, the government of Maharashtra has attained tremendous success in the health programme for mothers and children.

SLAMMING UP

The present paper has attempted to evaluate the demographic transition in Maharashtra since the 1950s. The study is divided into two parts. First part deals with the transition during the pre 1970 period; while the second part deals with the transition in the post-1970 period. The data for the pre-1970 period have mainly been taken from the fertility surveys conducted by the Gokhale Institute, Pune. They provide two interesting data sets, which enabled us to examine the fertility transition in rural and urban areas of Maharashtra.

The National Fertility and Mortality Surveys conducted in 1980 and the National Family Health Survey conducted

in 1992 provide us an opportunity to access the demographic trends during these 12 years. This study has special importance since Maharashtra, in spite of its high contraceptive prevalence is showing very moderate decline in birth rate. The reasons for such stalling of birth rate decline could be identified with the help of these two statewide surveys with adequate gap. The information on birth and death rate and contraceptive prevalence could otherwise be obtained from SRS and the service statistics. However, the surveys are expected to be more reliable and have information on various other related items, which probably could not be obtained from SRS or service statistics.

The comparison of birth rate and TFR for the two points of time revealed only a moderate decline of 3 points (from about 30 to 27 per 1000) in the birth rate and a decline of 0.9 points in TFR. The decomposition of birth rate into factors such as age structure, marital status composition, marital fertility and the proportion of women of reproductive ages led us to conclude that the slow pace of decline in birth rate is due to fairly large contribution of factors leading to increase in fertility.

It is recalled here that the transition during 1954 to 1966 had an effect of fall in the incidence of widowhood, which was the influence of rapidly declining mortality rates during the 1950s. Now, for the transition during 1980s, we again find that the effect of factors leading to increase in fertility is quite significant. In this case, these factors are in the form of reduced foetal losses, lesser childlessness and reduced breast-feeding. These are closely related to the reproductive health of the woman. Thus, we find that the transition in the earlier period was affected by overall better survival, while for the latter period, better reproductive health could be the main factor leading the increase in fertility.

If the state desires to accelerate the decline in fertility, obviously, it cannot do anything with respect to the effects due to improvement in health and hence it has no other way other than strengthening the IEC component of the family welfare services through which the couples could be motivated in a desirable direction. The current target free approach is trying to improve the programme qualitatively. But it is too early to speculate about the success of the new approach. We hope that proper steps are taken and once again Maharashtra reaches the top position befitting the pioneering work by R D Karve.

Reproductive Health Information in India

What Are the Gaps?

Shireen J Jejeebhoy

Although the NFHS has succeeded in updating and enhancing our data base, it has not been able to address some major reproductive health issues that lend themselves to being dealt with in large surveys. Among them, maternal health status and morbidity, and their correlates; quality of care concerns and women's ability to exercise reproductive choice are areas where data gaps continue to exist.

THE current focus on reproductive health in India marks a global recognition that reproductive health needs have been largely neglected and that the consequences of this neglect have been profound, particularly for women. It also marks a recognition of the need to re-orient India's traditional population programme to go beyond demographic targets, contraceptive prevalence, and female sterilisation, to a more comprehensive focus on reproductive health needs and services, particularly those that respond to reproductive health needs in ways which are sensitive to the socio-cultural constraints women and adolescent girls face in acquiring services and expressing health needs.

Despite the interest in reproductive health in India, and despite major national level data gathering exercises, information on the reproductive health situation continues to be incomplete and patchy [Jejeebhoy 1997]. A major limitation in addressing reproductive health needs has been the paucity of good data. The objective of this paper is to summarise the contribution of the recently concluded National Family Health Surveys (NFHS) to enhancing what is known about reproductive health and choice in India; and to highlight the considerable data and information gaps that remain.

REPRODUCTIVE HEALTH: THE SITUATION AND DATA GAPS

The NFHS was undertaken with the principal intention of providing state- and national-level estimates of fertility, infant and child mortality, the practice of family planning, maternal and child health care and utilisation of services provided for mothers and children, rather than reproductive health more generally [IIPS 1995]. The survey has generated a wealth of national- and state-level data in these areas. Yet, from a broad reproductive health perspective, the contribution of NFHS has been quite limited: for assessing many

aspects of reproductive health, data are simply unavailable; for others, we continue to rely on indirect estimates or small community level investigations. Below I discuss various aspects of reproductive health in India, the available data, their sources, and continuing gaps.

Safe, effective, affordable and acceptable methods of family planning of choice: By far the most comprehensive data available in India pertain to contraceptive behaviour. While data on family planning have traditionally been available through programme statistics and regular surveys, the NFHS has provided additional insights into contraceptive levels and trends, as well as on the quality of the contraception experience. Much can be gleaned from NFHS data on contraceptive behaviour:

More than two in five couples in the reproductive ages currently use a method of contraception. Consistent with programme priorities that have largely ignored both non-terminal female methods and especially male methods, two out of three of these contracepting couples are protected by female sterilisation, and almost nine out of ten by a female method. As a result of the emphasis on terminal contraception, young and low parity women remain unprotected from repeated and closely spaced pregnancies: only 16 per cent of women below 30 practise any form of contraception, compared to 55 per cent of all women aged 30 to 44.

Awareness of at least one method of fertility control – almost always female sterilisation – is virtually universal (96 per cent), but two-thirds of fewer women are aware of non-terminal methods. Unmet need for contraception remains relatively high (currently married women who want no more children but are not using a method of contraception). As many as one in five couples report an unmet need (20 per cent); one in ten (9 per cent) has had an unwanted birth, and one in seven (14 per cent) a mistimed birth.

The NFHS has gone far beyond other fertility surveys in providing information

on the contraceptive experience. The two important information capsules are: (a) side-effects are suffered by between one-fifth and one-third of all users; side-effects range from low back pain, to menstrual disturbances, to general weakness; (b) health (15 per cent), and menstrual (7 per cent) disturbances, and method failure (5 per cent) represent the leading reasons for method discontinuation (after desire to become pregnant). Discontinuation also occurred for personal reasons: lack of sexual satisfaction (2 per cent); method inconvenience (3 per cent); and dislike of method (4 per cent).

There is no doubt that the NFHS has expanded and updated what we know about contraceptive behaviour. But data gaps persist, particularly in the area of informed choice. For example, few data enable assessment of the extent to which women are fully informed of the array of methods from which to choose, or their potential side-effects. Even less is available on the decision-making process, both vis-a-vis the family, and vis-a-vis the provider. A major limitation of the NFHS is its inability to address such critical issues as the extent to which women exercise choices in these matters, without coercion; whether women actually obtain a method of choice; and the constraints that the average woman or man faces in seeking contraceptive and follow-up services. For these kinds of data, we continue to rely on small, and mostly in-depth, qualitative studies.

Safe child-bearing and access to appropriate health-care services: A second major contribution of the NFHS is in expanding and systematising what we know about maternal mortality and health, and access to ante-natal, and delivery services. It has also succeeded in going beyond other retrospective data gathering exercises by obtaining data on one aspect of maternal morbidity, namely complications, at the time of delivery.

For one, data from the NFHS reiterate the fact that maternal mortality levels in India remain among the highest in the

world – 437 per 100,000 births (448 and 397 in rural and urban areas respectively).¹ Other estimates suggest ratios of 555 per 100,000 live births [Bhat et al 1992], giving rise to the suggestion, however, that NFHS estimates of maternal mortality should be taken as a lower limit.

Neo-natal mortality or mortality in the first 28 days of life is also disturbingly high in India: 52.7 per 1,000 live births [IIPS 1995]. More than three in five infant deaths occur during the neo-natal period; moreover, while infant mortality during the post-neonatal ages has been declining rapidly, declines in neo-natal mortality have been more sluggish.

Also contained in the NFHS is considerable evidence suggesting that access to ante-natal and delivery services in the NFHS is far from universal. Few women have access to ante-natal care: only two-thirds of all women (and two in five rural women) had received even one ante-natal check up from a doctor or other health professional; only 54 per cent were fully immunised against tetanus, and only 51 per cent received iron supplementation. Access to safe delivery is equally poor: two out of three Indian women continue to be delivered by untrained attendants, and three in four are delivered at home, usually in unhygienic conditions.

For the first time in a survey of this nature, the NFHS provides evidence on one aspect of maternal morbidity, i.e., complications at delivery. The results suggest that 12 per cent of recently delivered women experienced one or more complications at delivery. This is very likely an under-estimate of complications at delivery, judging from rates of 18 per cent observed in the recent in-depth study of obstetric morbidity in Karnataka [Bhatia and Cleland 1994], and from the fact that there was little probing of conditions that are well known to be perceived as 'a woman's lot' [see, for example, Koenig and others 1996 for biases]. Nevertheless, it offers some valuable insights, by state, into an important but neglected dimension of obstetric health.

Notwithstanding these achievements, major data gaps remain. The most serious gap is the absence of data on morbidity in the ante-natal and post-natal periods. Data stop short of providing the full picture on women's obstetric health status, and the available data on reported complications at delivery grossly under-estimate overall levels of maternal morbidity. For estimates of maternal morbidity, we must continue to rely on a few existing community-based assessments that have addressed all three

periods, and suggest considerably higher rates of maternal morbidity: 41 per cent in a study in Karnataka [Bhatia and Cleland 1994], and 30 per cent in a prospective study in Rajasthan [Datta and others 1980]. Although undoubtedly, questions on reproductive morbidity do not lend themselves easily to large-scale surveys, it is possible – as shown even by the NFHS – to collect useful information on certain conditions at delivery. Such observable symptoms of morbidity in the ante- and post-natal periods as bleeding, swelling of feet, weakness (anaemia), fever, discharge and so on, with appropriate probes, can presumably be incorporated, with equal success, into more detailed studies of maternal morbidity [see, for example, Figa-Talamanca 1990]. Moreover, health surveys can elicit data on cause-specific morbidity with culturally appropriate questions for a number of conditions. Although retrospective community-based studies face problems of recall, and must rely on self-reported symptoms which can often under-estimate true levels of morbidity, they provide a more reliable profile of maternal health than hospital-based studies do.

Also neglected in the NFHS are data on women's circumstances during pregnancy, child-birth, and the post-partum period. Although it is well known that diet and feeding patterns, work-loads, rest, and conditions at delivery have a strong influence on maternal outcomes and health, we must rely on a handful of relatively small studies, such as those conducted in Karnataka and Rajasthan [Bhatia and Cleland 1994; Datta and others 1980] for these insights. And although the NFHS carefully documents whether and how often ante-natal care was received, the content of such care is not addressed.

Abortion and access to safe and affordable services: Despite the fact that abortion has been legal in India for over 20 years, reliable data on the prevalence and patterns of induced abortion continue to be sparse, and we continue to rely on indirect estimates. While the NFHS did enquire about women's experiences of induced abortions, results – that no more than 1 per cent of all recent pregnancies terminated in abortion – are a gross under-estimate of abortion experience. For example, indirect estimates suggest that five to six million abortions continue to be performed annually; of these, only about 0.6 million abortions are performed under the health services network [UNICEF 1991; Chhabra and Nuna 1993]. Other survey data also suggest that complications resulting from unsafe abortion exact

a heavy toll, and constitute a major source of reproductive mortality and morbidity: according to SRS data, over 10 per cent of all maternal deaths are due to abortions.

Huge data gaps persist in the area of abortion in India. The gross under-estimation of induced abortion in the NFHS and other demographic surveys highlights the observation that induced abortion is a sensitive topic and cannot always be reliably elicited through such questions as 'have you ever had an abortion?' and 'how many abortions have you had?' Although large surveys like the NFHS may not be the best design to elicit detailed data on induced abortion, future NFHS surveys would do well to ask more than a single question on experience of abortion in a non-threatening manner (for example, were you ever pregnant when you did not want to be; what did you do) probe long birth intervals, and so on, to obtain more comprehensive information on the incidence of abortion [see for example Huntington 1993].

A second major gap in data relates to awareness of the legality of abortion. Despite the fact that abortion has been legal in India for over twenty years, not much is known about the extent of awareness of the legality of abortion, of unrestricted abortion or about legal facilities. Although the NFHS inquired about awareness of legal minimum age at marriage, it has neglected to inquire about a law that has equal implications for reproductive health.

Third, aside from the prevalence and awareness of abortion, urgently needed are data on the socio-cultural context of abortion – undoubtedly beyond the scope of large surveys such as the NFHS. Far more appropriate here would be small scale community-based surveys. These can be flexible, combining both quantitative and qualitative methods, and inquiring about induced abortion from women providers and others in more than a casual way. More information is needed on how and where abortion is conducted, what methods are utilised, costs of abortion and so on. Also needed are data on complications from abortion, their nature, their treatment and costs. Finally, data are needed that examine the constraints women face in seeking MTP services. Many hypotheses have been raised in the literature, including lack of accessibility, ignorance of legal services, costs, and impersonal and intimidating abortion services and care at approved centres.

The capability to reproduce – infertility
The singular focus on fertility control is

India has resulted in the neglect of infertility, a serious re-productive health concern, with serious implications in terms of determinants and consequences. Just as the pro-gramme has neglected the subject, so also, available data from the NFHS and other surveys are sparse: data from the 1981 census [ministry of health and family welfare 1990] and a village level study in Maharashtra [Bang et al 1989] suggest that infertility may be in the range of 6 per cent-7 per cent of couples. The NFHS, unfortunately, sheds little light on this issue, other than estimating childlessness as 2.4 per cent among married women over 40, and providing little insights into the situation among younger couples married for a given number of years.

Aside from data on childlessness, drawn mostly from fertility surveys including the NFHS, there have been few focused attempts to derive data on either primary infertility or sterility, or secondary sterility in India. While a wide range of factors may account for infertility – including, among other things, women's poor health and nutrition status which can lead to repeated miscarriages and foetal wastage, unhygienic obstetric and abortion procedures, STDs and even such debilitating diseases as tuberculosis – few studies have attempted to assess these underlying factors. Worse, in a culture which prizes reproduction, there is little more than anecdotal information on the consequences of infertility for female well-being – preventing her from achieving her desired family size and exposing her to various kinds of emotional distress and harassment or marital disharmony. Finally, there are few data to assess the extent to which health services are comprehensive enough to provide access to information, and services to infertile couples.

As in the case of abortion, these information needs cannot be appropriately addressed in large-scale data gathering exercises such as the NFHS. More appropriate are community-based exercises to measure the prevalence and patterns of primary and secondary infertility, probing long open birth intervals. At the same time, intensive, qualitative data from infertile women and men and local providers and others may result in more comprehensive information on behavioural correlates and consequences of infertility.

Prevention and care of gynaecological morbidity: Other widespread but neglected dimensions of reproductive health in India are gynaecological morbidity, notably reproductive tract infections, cervical cell changes and genital prolapse. Till recently,

gynaecological morbidity was rarely considered a problem and was rarely studied in community-level surveys anywhere in the world; today there are several small-scale investigations of morbidity at the community level. Large scale surveys such as the NFHS shed no light on this issue – not even awareness of these conditions. It is unclear, moreover, whether large surveys of this nature are appropriate for gathering data on gynaecological morbidity.

That gynaecological morbidity represents a serious problem has been observed from a few community-based studies which have tried to fill this gap in our knowledge of reproductive tract infections and other aspects of reproductive health. All of these studies, studied during the 1990s and many thus far unpublished, provide data on many self-reported and clinically diagnosed morbidities. Although methodologies vary, and although studies have been limited by women's reluctance to both acknowledge morbidity and undergo examination, high levels of morbidity – ranging from 50 per cent to over 90 per cent – have been observed. Despite variation in levels, a common set of disorders emerged in all studies: menstrual problems and excessive vaginal discharge. In clinical examinations, cervicitis, vaginitis and pelvic inflammatory disease, all reproductive tract infections, were the leading morbidities [Baroda Citizen's Council and others 1995].²

Because of women's reluctance to discuss these issues and because gynaecological morbidities are frequently asymptomatic, large surveys, such as the NFHS, are probably inappropriate to study gynaecological morbidity. Yet there is a need for more representative data on gynaecological morbidity: what is required are dedicated surveys that allow for detailed probing, and greater rapport [Koenig and others 1996], that allow for differences in local cultural conditions, vocabularies and patterns. More data are required that would shed light on the socio-cultural determinants or correlates of gynaecological morbidity, including, among other things, water and sanitation, personal and menstrual hygiene, unhygienic obstetric and abortion procedures, and sexual behaviour of husband. Likewise, data are required on treatment seeking patterns of women with an expressed morbidity, and on the quality of services received by women expressing gynaecological morbidities.

Sexually transmitted diseases: The NFHS set a precedent by inquiring about

awareness of one – HIV and AIDS – sexually transmitted disease in 13 out of 25 states. While statewide awareness of 'a disease called AIDS' ranged from 8 per cent to 85 per cent, misperceptions abound: among those 'aware' of the disease, between 8 per cent and 41 per cent think that AIDS is curable, and between 25 per cent and 88 per cent cite 'safe sex', undefined, as a means of avoiding AIDS.

Information on levels and patterns of sexually transmitted diseases comes predominantly from surveillance data, studies of patients of STD clinics, or of 'high risk' groups. From these sources come estimates that over a million men and women are suffering from HIV/AIDS with dangerous potential for its wider spread, that sero-positivity is as high as 17.8 per thousand samples screened (total screened: 29,71,825, Nexus, May June 1997), and well over 30 per cent among such high risk groups as commercial sex workers. Recent surveillance at hospitals in Mumbai city report that as many as 5 per cent of women presenting to these hospitals for ante-natal care – 'low-risk' by all accounts – are HIV positive [Salunke 1997]. Community-based studies are rare but sorely needed. One example is a village-level investigation of 650 women in Maharashtra: this study observed that disturbingly large proportions of women (10.8 per cent) suffered from syphilis and gonorrhoea [Bang et al 1989].

Thus far, two types of investigations of sexual behaviour and practices in India have been carried out. The first is small qualitative studies [see for example Bhende 1994; George and Jaswal 1994], the second has focused largely on literate populations who can respond to self-administered questionnaires [see, for example, IPAI-SECRT 1990; Watsa 1993; Goparaju 1993; Savara and Sridhar 1994]. While both types of studies have enriched what we know about sexual behaviour, neither is representative and hence data on KABP remains selective.

Reproductive health of adolescents, particularly girls: Little is known about adolescent reproductive health in India [Jejeebhoy 1996]. Adolescent girls, most of whom are out-of-school, are particularly vulnerable and neglected, coming under the purview of government programmes only once they are pregnant. Correspondingly, the bulk of available data, drawn from the NFHS as well as other sources, focuses on adolescent child-bearing rather than more comprehensively on their reproductive health. The NFHS data reiterate that marriage and

childbearing continue to be early and universal. The median age at marriage is about 16 years -- and large numbers of women are pregnant before reaching the age of 16, often before they are physically fully developed. As a consequence, 7.3 per cent of pregnancies among women aged 15-19 resulted in a spontaneous abortion (compared to 4.5 per cent in the general population). In addition, 1.7 per cent had experienced an induced abortion.

Married adolescents are undoubtedly vulnerable. Surveys such as the NFHS should be able to address constraints on their health seeking behaviour, the extent to which their contraceptive needs are met; and their health awareness in the areas of pregnancy, contraception, and exposure to disease.

Since the NFHS refers only to currently married women, it cannot comment on sexual activity of unmarried young people. What is known comes from small, unrepresentative studies, and suggests that boys, no less than girls, are ignorant of sexual matters, although high-risk sexual activity among adolescents and youth -- especially boys -- appears to be increasing [see, for example, Bhende 1994; Chaudhary and Francis 1994; FPAI-SECRET, 1990; Goparaju 1993; Watsa 1993]. Data from hospital and clinic based

studies suggest that unwanted pregnancies and unsafe abortion among urban adolescent girls in particular are not uncommon [Chhabra and others 1988; Divckar and others, 1979; Solapurkar and Sangam 1985]. Increasing sexual activity combined with ignorance about safe sex is a particularly alarming combination in light of the HIV epidemic. Far more KARP data are thus required from adolescents; far more is needed, likewise, on unwanted pregnancies and abortion practices among urban adolescent girls, their socio-cultural context, health implications and social consequences. Again, these are sensitive issues and require imaginative and sensitive designs, using a combination of quantitative and qualitative methodologies.

Access to and of quality of re-productive health care: Little systematic evidence exists in India about standards of care in the family welfare programme or specific steps which can be taken to improve it. Correspondingly, quality of care issues are largely omitted from large data gathering exercises. In other studies, more attention has been paid to physical infrastructure, personnel and equipment than on quality of care especially from the woman's (client's) perspective. Whatever is available on quality of care pertains largely to contraceptive services and virtually ignores maternal health and other

reproductive health services. Even in the area of quality of contraceptive care evidence from smaller and more qualitative studies suggests that quality of care tends to be poor, impersonal, threatening or simply unavailable to women. Contraceptive choices are, in practice limited; outreach and pre-acceptance counselling are minimal; service providers are reported to be unresponsive to the needs of women, uncaring of their dignity and lax in offering post-acceptance follow up [see Foo 1996].

The NFHS has gone beyond other large surveys -- but not far enough -- in obtaining data on some aspects of quality of care in the area of family planning. Quality of care data is limited to the extent of contraceptive follow-up, and assessment of care during sterilisation. Results suggest that only between half and two-thirds of users have received follow-up services worse, only 15 per cent of OC and IUI acceptors, and 30 per cent of sterilised women received follow-up service through domiciliary visits. Yet sterilised women are generally favourable about care during sterilisation.

A major limitation of the NFHS is its lack of attention to data on access to and quality of care. Available data on quality of care in family planning (FP) are available but limited [see Foo 1996 for a review of

New Books from Orient Longman

POLITICS OF CULTURE

A study of Three Kirata Communities in the Eastern Himalayas

T B Subba

This book traces the cultural proximity and the similar destinies of three Kirata communities living in the eastern Himalayas—the Limbu, the Rai and the Yakkha. Spanning the last two hundred years, this book outlines the process of economic, linguistic, religious and cultural degeneration that the groups faced at the hands of the powerful Gorkhas in Nepal and the Namgyals in Sikkim, resulting in their becoming victims of state-formation in these two erstwhile Himalayan kingdoms.

COLONIALISM IN ACTION

Trade, Development and Dependence in Late Colonial India

Dehdas Banerjee

India under Pax Britannica was a free market economy. There was a flourishing trade of primary goods from India for manufactured goods from the West. What, then, went wrong? Why was India caught in the vicious circle of low per capita income, poverty, illiteracy and mortality? This book attempts to relate the structure of India's foreign trade with changes in the domestic conditions of production and consequent development, or underdevelopment, of the internal market. It delves into how institutions of colonial oppression completely eclipsed all modernising projects for an industrial, capitalist economy. In essence, it helps provide a better grasp of what is meant by Colonialism in Action.

research findings), and data on the quality of care in the area of maternal and child health are totally missing, despite the fact that maternal and child health was a focus of the survey. More extensive data in the areas of contraception and maternal health could have been incorporated without difficulty in a large survey of this nature. Their omission in the NFHS represents a missed opportunity.

Major gaps exist in information on access to, and the quality of re-productive health care. In the area of family planning, much more data need to be generated on the client's perspective, i.e., such concerns as women's ability to exercise informed choice, the constraints the average woman faces in seeking services, in voicing fears and side effects, the extent to which they receive complete pre-acceptance counselling including information on potential side-effects and complications, the extent, frequency, location and content of post-acceptance follow-up, and the quality of their interaction with the service provider. More data need to be generated, likewise, on the provider's perspective and barriers to the provision of quality care.

While quality of care in FP has been addressed in surveys, however cursorily, quality of care in other dimensions of reproductive health remains largely unknown. A major data gap pertains to the quality of maternal health care, the frequency and content of ante-natal or post-partum visits, treatment of complications and morbidities, and the quality of care during delivery. Although data are collected on the extent to which these services were received, there has been no attempt to assess from women the quality of these services. Even fewer data are available on the quality of care in such other aspects of reproductive health as abortion, infertility, gynaecological morbidity or sexually transmitted diseases; focused studies of clients of various kinds of services with a strong qualitative component may yield an idea of quality of care as well as other constraints women face in acquiring quality care in these more sensitive dimensions of reproductive health.

Informed reproductive choice. A final important limitation of the NFHS, despite the thrust of the ICPD [United Nations 1994] on reproductive rights, is the absence of data on the extent to which women exercise real choices in matters relating to reproductive behaviours. Available data from small, largely qualitative studies point to a range of obstacles that limit women's access to, and ability to exercise choices regarding reproductive health care, whether

relating to pregnancy and childbirth, contraception, abortion, or gynaecological and sexually transmitted morbidity [see, for example, World Bank 1991; Gittelsohn and others 1994]. They include ignorance of and superstition surrounding danger signals, and appropriate practices. They also include women's limited decision-making authority, physical mobility, and access to resources; and poor perceived quality of interaction with providers. All these constraints add up to an insurmountable obstacle for large numbers of women in exercising choices. Such data have been collected in large data gathering exercises, and it is unfortunate that the NFHS cannot, at least in this round, shed light on this important determinant of reproductive health.

REPRODUCTIVE HEALTH INFORMATION NEEDS: HAS NFHS FILLED THE GAPS?

Notwithstanding the considerable contribution of the NFHS, our data-base in the area of reproductive health remains slim. The NFHS has succeeded in updating and enhancing our data base; but it has not gone far enough. Clearly, it is inappropriate to expect that large scale surveys such as the NFHS can address all reproductive health data needs. Even so, several major reproductive health issues that lend themselves to large surveys were not addressed adequately: (a) maternal health status and morbidity and their correlates; (b) quality of care concerns, in family planning, maternal health and other dimensions of reproductive health; and (c) women's ability to exercise reproductive choices. On other aspects of reproductive health – such as levels of abortion, and primary and secondary infertility – data quality and scope could have been much improved, using a series of more imaginative questions and probes.

Other dimensions of reproductive health that are particularly under-researched or require extensive probing (context of abortion and infertility, sexual behaviour, adolescent reproductive health, gynaecological morbidity) lend themselves to large survey exercises less easily. Data gaps in these areas can be addressed more appropriately by focused and preferably community-based studies [see, for example, Bharia and Cleland 1995a, Baroda Citizen's Council et al 1995, on gynaecological morbidity; both incorporated clinically diagnosis, self-reported symptoms, and treatment seeking patterns], with scope for both quantitative and qualitative designs, and standard social science research as well as multi-disciplinary research in collaboration with

medical researchers or non-governmental organisations.

Whatever the dimension, underlying women's poor reproductive health are behavioural concerns, including lack of autonomy and inequalitarian gender relations. Few studies, including the NFHS, provide insight into these issues. Data pertaining to the constraints women face in attaining good reproductive health – in terms of lack of decision-making authority, freedom of movement and control of economic resources, poor information and education, and socio-cultural barriers to recognising, articulating and seeking care for health problems – are critical in order to understand the correlates of every dimension of reproductive health. These need to be incorporated into all data gathering exercises in reproductive health, irrespective of design.

In short, reproductive health data needs in India continue to be considerable. The absence of rigorous data – both quantitative and qualitative – on most aspects of the reproductive health situation in India remains an important stumbling block in convincing policy-makers of the need for a broader orientation for current family welfare programmes. The challenge is to strengthen the data base, and the next round of NFHS provides an excellent opportunity to do so.

Notes

[A longer version of this paper was published in *The Journal of Family Welfare*, permission to use parts of that paper is gratefully acknowledged. The paper was originally prepared for the 19th annual conference of the Indian Association for the Study of Population, M S University, Baroda, February 26-28, 1996. I am also grateful to Shanika Rangopal for compiling the available literature and data, and to Michael Kreemg and Teela Visarm for their comments.]

- 1 The NFHS sample was sufficiently large to estimate maternal mortality at the national level for the two-years preceding the survey; estimates are based on a series of follow up questions on cases of death to women aged 13-49: whether the woman was pregnant when she died, whether the death occurred in childbirth, whether she had died within two months of delivery and whether the death was due to a complication of delivery.
- 2 In one of the earliest investigations regarding rural women in Gadchiroli district, Maharashtra [Bang et al 1989], clinical examinations found that 92 per cent had one or more gynaecological diseases and infections of the genital tract, including pelvic inflammatory disease, vaginitis and cervicitis, and this contributed half of morbidity. Despite this high prevalence, only 8 per cent had undergone gynaecological examination and treatment in the past.

NATIONAL CENTRE FOR ADVOCACY STUDIES

is a social change resource centre working all over South Asia. People who are committed to human rights and social justice and willing to work with rural communities and grassroots group can apply for the post of:

Editorial and Documentation Assistant

Proven record in writing skills, with a Post-graduate degree in English (Literature) / Communications Studies / Economics. The responsibilities include editorial assistance for publications.

Communication and Information Technology Assistant

Proven record and excellent abilities in computer application. Post-graduate/ Graduate or with training in computers or minimum two years of working experience. The responsibilities include management of computer systems, supporting online journal and assisting the Director in official communications.

Apply within 15 days to

The Director, NCAS

2, Santash Apartments, Sheelavihar Colony,

Paud Road, Kothrud, Pune 411 038.

National Family Health Survey: Some Thoughts

Tara Kanitkar

For the first time by achieving a degree of uniformity in the administering of questionnaires, sampling methods, data collection, analysis and presentation, the NFHS has been able to generate data on demographic characteristics which are comparable across regions.

THIS paper attempts to look back at the National Family Health Survey (NFHS), though not in a too dispassionate, objective manner, although more than five years have elapsed since the publication of various state reports. The intention is to provide some salient features of the NFHS and then narrate some of the events, some of the decision-making processes and present some hindights.

The NFHS 1992-93 has been a massive undertaking covering the length and breadth of this continent-size country. The NFHS has covered 89,777 ever-married women in the age group 13-49 from 88,562 households. Never before in India such a huge demographic and health survey was successfully conducted in a short prescribed time.

The primary objective of the NFHS was to provide national and state level data on fertility, nuptiality, family size preferences, knowledge and practice of family planning, the potential demand for family planning, the level of unwanted fertility, utilisation of antenatal care services, breast feeding and food supplementation, child nutrition and health, immunisations and infant and child mortality. A further objective was to explore the demographic and socio-economic determinants of fertility, family planning and maternal and child health. It is intended that the information collected in the NFHS would be useful to the planners and policy-makers and researchers to assess and evaluate the population and family welfare programmes and strategies of individual state and the country as a whole.

The NFHS was unique in several ways. It covered all states (except Sikkim) of India and provided separate estimates for urban and rural areas of each state. It was unique because of the uniformity of its questionnaires, sampling method, data collection, analysis and presentation of data. Because of these features inter-state comparisons of the findings are valid and meaningful. It was unique as it could provide the basic important findings to the planners and policy-makers and administrators within a short period of three to six months after the last interview was completed in each state (through

dissemination of the findings provided in the preliminary reports).

It was for the first time that a representative sample was canvassed for a demographic and health survey in the north-eastern states of the country. Even Punjab could be covered in the NFHS when the veil of unrest was lifted off the state for a short time. We would have missed important demographic information from the state ranking first among India's major states in terms of per capita income and per capita production of food, had we not conducted the NFHS in Punjab. That we were obtaining data in relatively tension free atmosphere could be realised when we visited the state (especially Taran Taran area which was notorious for the extremists' activities) for data collection operations.

Although uniform questionnaires were used in the NFHS, for some specific problems associated with particular states, some questions were added to the questionnaire. For example, in Punjab additional information was collected on international migration and pre-natal determination of sex; in Rajasthan, on attitude towards child marriages; on knowledge of AIDS in states of Maharashtra, Gujarat, national capital territory of Delhi, Tamil Nadu and all north-eastern states facing problems of HIV/AIDS. Specific topics covered in various states are listed in the Appendix.

Each important technical aspect of the NFHS such as content and format of the questionnaire, sampling design, tabulation plan and format of the report, was discussed in a workshop, which was attended by the representatives of the Population Research Centres, ministry of health and family welfare (MHFW), the International Institute for Population Sciences (IIPS), Mumbai (the nodal agency appointed for co-ordinating the survey activities), Macro International and East-West Center, US, and various data collecting organisations.

While finalising the survey questionnaire after pretesting, there arose a problem regarding the inclusion of the items on weight and height of children under four years of age in the questionnaire. Some of us, more specifically our consultants at

Macro, were not too favourably inclined towards the idea as they thought that the time and energy spent in weighing and measuring the children by no means an easy job - could adversely affect the quality of other data. I was also in two minds. However K Srinivasan, the then director of the IIPS, was insistent and it was decided to collect information on the weight and height of children as we were also collecting information on several aspects related to the nutritional status of the children.

Now there was a problem of obtaining weighing scales and measuring instruments. We approached UNICEF and Foster Parents Plan International, Delhi and in keeping with their fine tradition of taking interest in the well-being of children, they supplied the NFHS, the salter weighing scales free of charge.

The question of instruments to measure height was still there. We needed an instrument which could measure the height either in supine or standing position accurately and at the same time be light enough to be carried in the field and sturdy enough for the rough and tough use in the field. It is a matter of pride that Meditron Instruments could develop such an instrument after several trials and modifications. Not only did we receive very constructive suggestions from the consultants from Macro while the instrument was being developed, but also their nutritionist helped to impart training to the trainers on weighing and measuring children in the most scientific way. Now it seems that the collection of data on the anthropometric characteristics of children is an important contribution of the NFHS.

The sampling design adopted in the NFHS was uniform over the states - a systematic, multi-stage stratified sample of households. The sampling for the NFHS in the states of Rajasthan, Bihar, Madhya Pradesh, Uttar Pradesh and West Bengal was designed to provide statistical estimates for groups of backward districts along with those for urban areas, rural areas and the state as a whole. The MHFW has defined backward district as one having a crude birth rate of 39 per 1,000 population or higher as estimated on the basis of data

obtained in the 1981 Census. The findings however indicated that there were no substantial differences in the estimates obtained for the backward areas and those for the total areas of Uttar Pradesh, Bihar and Madhya Pradesh. In Rajasthan, more than 95 percent of the surveyed population lived in the backward districts; hence no separate estimates have been provided for backward or non-backward areas in the report. In West Bengal only two Muslim dominated districts were designated as backward districts and some important differences are noticed between the backward areas and the total area – with backward areas reporting demographic backwardness as well. On the whole, now it seems that this whole exercise was not fruitful in view of the time and resources involved. In hindsight it appears that it would have been much more meaningful if the sampling had been designed to provide separate estimates for different regions of the states as we had the resources (thanks to the generous aid from the USAID) and one of the best sampling experts was available to us.

Looking back about urban areas, we could have tried to obtain separate statistical estimates for the slum and non-slum areas. It is a fact that the slums include a significantly high proportion of the population (maybe between 40-45 or higher and fast increasing percentage of our metropolitan cities) and the slums accommodate most of the marginalised and socio-economically disadvantaged population. It is therefore essential that any socio-economic, demographic and health study should provide disaggregated data for the slum and non-slum dwellers. Such information would have been of immense value to the planners and policy-makers. Again stretching the argument a little further, it is suggested that in future if we have another NFHS an attempt should be made to capture the unauthorised or non-recognised as well as the authorised or recognised slums in the sampling design.

At the risk of sounding over-ambitious I would like to add that NFHS could have tried to obtain estimates for the metropolitan cities of Mumbai, Chennai and Calcutta, as it had done for national capital territory of Delhi.

A very important feature of the NFHS was a thorough, in-depth training of the interviewers. It may not be an exaggeration to state that a large part of the success of the NFHS was due to the most intensively trained interviewers. In order to bring uniformity in the training, the trainers of each state were

trained at two-week training sessions arranged by the IIPS with the help of Macro International.

These training sessions were very enjoyable. Once we arranged a demonstration of a live interview in the class room. A married village woman working as maid servant, age around 33-34, having five live births and four living children and sterilised, agreed to be our respondent in the classroom. I was slightly apprehensive that the woman might develop cold feet just before or during the interview and refuse to answer questions or stop in between. Luckily the woman responded very bravely. While one investigator was interviewing her in Marathi another was recording the translated responses very neatly on the questionnaire which was projected on the overhead projector. The trainees watched the principles of interviewing put in actual practice in utter silence. We could even watch the exercise of arriving at the approximate age of the woman (the respondent was illiterate and had no idea about her age) by asking probing questions. It was a great educating process for all of us, which also showed how to tackle unexpected situations presenting itself while the interviewing was going on when she stated the name of her second daughter as 'Anuradha'. First daughter who was dead was also 'Anuradha'. How can this be possible? The class soon learned that the first daughter died in infancy and in that part of Maharashtra, it is a custom to give the name of the dead offspring to the next child. The interview was by no means an easy one. There were all typical hurdles the interviewers in India usually come across. I wish we had video-taped that interview. In future it would be of great help while conducting training of the interviewers to show the video film of one or more live interviews in the field.

The NFHS entrusted the work of collecting data to various data collecting organisations designated as consulting organisations (COs). There was resentment among some of the Chiefs of the Population Research Centres (PRCs) and rightfully so, as they were capable of collecting quality demographic and health data independently, against entrusting the data collection to the COs. However, some of the PRCs were small and did not have enough manpower to manage a large-scale survey. It was not possible to give the responsibility of data collection to some of the PRCs and employ COs for some other states. Besides, there was an urgency of completing the entire data collection

before June 1993 and we could not afford to delay data collection due to typical red tapism observed in the PRCs located in the universities. Hence it was decided to get the services of the COs for data collection and PRCs were to help them in translating the questionnaires, recruiting and training the interviewers and supervision while data collection was going on. Hence the responsibility of data collection was given to the COs. Practically in each state the relationship between the PRC and the CO was strained at some stage or the other. Whereas the PRC thought that the CO was more profit-oriented than interested in collecting good quality of data, the CO felt that the PRC was making undue demands regarding the per diem allowances and other facilities to be given to the supervisors and team leaders seconded by the PRC. Regarding per diem payment to the research officers seconded by the PRC and the IIPS, there were no guidelines and the COs fixed the rates according to their convenience and there was quite some dissatisfaction. The same was the case with the remuneration of interviewers.

In a second round of the NFHS is to be conducted, the question to whom the data collection should be given, would again arise as and could be more sensitive. The MOHWF has initiated a project to strengthen the survey research capabilities of the PRCs and the NFHS has been an important component of this PRC project. It is now important to examine how far is the survey research capabilities of PRCs have been strengthened achieved. This could help in the decision about allotting the responsibility of the data collection.

During the data collection stage, the COs had to face many natural as well as man-made calamities such as excessive rains, landslides, intensive heat, Ayodhya incident and its aftermath, communal riots and tensions, bomb blasts, Naxalite problems, etc. The COs however received compensation for the time lost. One important difficulty faced was finding suitable interviewers and retaining them throughout the data collection period. In this respect the PRCs helped the COs in general.

The quality of data is an important factor in any demographic and health survey. The quality of data could be affected if the interviewers do not do their jobs honestly. They may not visit the households and may fill-in the questionnaires at home. It was the remotest possibility in the NFHS because of the strict supervision. Taking into consideration various factors which affect

Indian age data, and the reporting of vital events such as births and deaths, more specifically children dying soon after the birth, etc, utmost care was taken to appraise the interviewers of all those points and train them thoroughly and intensively. Drilling the interviewer in estimating the age of the respondent was an important aspect of the training and considerable time was devoted to it and a variety of probing techniques were used for this purpose. Although it cannot be said that the NFHS data are free from all the reporting errors, it can be stated that the age data for ever-married women age 13-49 are better than those of the other females and males as their ages were reported by the head of the household or any responsible member of the household. As regards other errors, such as missing the key variables, completeness and accuracy in reporting the births, age displacement, and the underreporting of girls, the NFHS data were found to be on the whole quite good.

Another method for gauging the quality of data is to look for the expected configurations and whether the results appeal or conform to logical reasoning. When the NFHS data were put to this test, it was found that in most of the cases they withstood the test. For example it is observed, in most of the states, when the data on the usual residents and visitors were analysed by age and sex, it was observed in most of the states that visiting is more common among young women in the age group 15-24 and their children (0-4 years). Given the Indian custom of the married daughters (more specifically those in younger ages) returning to the 'parents' house for the delivery of a child,

particularly the first or the second child, or just visiting them with their children of preschool age, one can expect to get an age-sex distribution of visitors such as we have found in many state reports and for India as a whole (a larger proportion of females in age groups 15-24 or 15-29 among visitors and again a larger proportion of children in the age group 0-4 years among visitors). Another instance of expected patterns relates to consanguineous marriages. As expected, there is high prevalence of consanguinity in the states of Andhra Pradesh, Karnataka, Tamil Nadu and Maharashtra and among the Muslims. Such instances talk highly about the quality of NFHS data, as no special instructions were given nor were special efforts made to collect data on these topics.

A post-survey check was conducted on 5 per cent of the NFHS sample by the Institute of Research in Medical Statistics (IRMS), New Delhi, which 'reconfirmed the high quality of the NFHS data'. In fact there was no need to have this 5 per cent resurvey as there were several inbuilt checks in the whole process of data collection, besides strict supervision and control. The field check tables were generated and on the basis of these tables, the performance of each interviewer was monitored. In the meeting of the steering committee specially set up for the smooth and efficient running of the project, when the then secretary, department of family welfare, government of India, who was ex-officio chairperson of the steering committee, suggested a resurvey of a sample of the NFHS, the idea was not welcomed for various reasons. In the plan of the NFHS the resurvey was not envisaged and as such, it was thought that the resurvey would be extremely difficult and expensive. Besides, the data collection in five states had already been completed. However, the chairperson insisted that there should be a check of the information already collected. The funding agency, the USAID, New Delhi, refused to fund this resurvey operation which according to it was superfluous. However, driven by the thought that the NFHS needed the resurvey very badly to prove its quality the secretary was insistent and it was decided that this operation would be undertaken and the department of family welfare would underwrite the entire cost. The IIPS prepared the whole plan for the resurvey. In the beginning there were no takers for this resurvey. However the IRMS agreed to do the job. No one was envious of IRMS. Five per cent resurvey was done and the NFHS received the

certificate which it did not really need at a cost of Rs 14 lakh to the national exchequer. After the NFHS reports of all the states were published, a one-day seminar was held by each PRC to disseminate the findings among the planners, policy makers and administrators in the field of health and family planning and the researchers. Most of them were held rather late. The purpose of these one-day seminars was not served in some states as the policy-makers and administrators remained apathetic and did not attend the seminar, for example, at the seminar held at New Delhi only one person from Delhi administration was present and in Maharashtra not a single elected representative of the 29 zilla parishads - a decentralised democratic body which is responsible for implementing the development programmes in the rural areas of the state - nor any of the chief executive officers attended the one-day seminar. One wonders whether such dissemination seminars have served any purpose except that the researchers could discuss the results. Preliminary reports for each state were prepared and disseminated to the data users within 3 to 6 months after completion of data collection. However, there was a great emphasis on not disclosing the findings not only to press, radio and television but also to fellow population scientists not connected with the NFHS. It is difficult to find justification for the obsession about the secrecy of the preliminary reports and results. A more relaxed policy about the dissemination of preliminary findings would have caused no harm; and in fact, it would most likely have benefited the analysis and final reports. We were late in publishing the results of the state-specific set of questions on the knowledge of AIDS. This information should have been published as soon as it was available. A point to this effect was raised in one of the meetings of the steering committee. The suggestion turned down as it was thought that no result of the NFHS should be given publicity unless they were firmly established. At the end it should be pointed out that the NFHS was unique in one more aspect. It was the most expensive survey ever undertaken in this country. But for the monetary and technical help from the USAID it would not have been possible to undertake and complete such a massive study within the time-span of one year. The NFHS has made history in successfully conducting a large-size survey in the country and I am happy and proud that I was a part of it as also were Ramesh, Fred, Bob and Roy.

APPENDIX

State	Specific Topics Covered
Arunachal Pradesh	Knowledge of AIDS
Assam	Knowledge of AIDS
Bihar	Dowry
Goa	Knowledge of AIDS
Gujarat	Knowledge of AIDS
Karnataka	Benefits from developments programmes
Kerala	International migration
Madhya Pradesh	Green cards
Maharashtra	Knowledge of AIDS
Manipur	Knowledge of AIDS
Meghalaya	Knowledge of AIDS
Nagaland	Knowledge of AIDS
Punjab	Sex preselection and International migration
Rajasthan	Age at marriage
Tamil Nadu	Knowledge of AIDS
Tripura	Knowledge of AIDS
Uttar Pradesh	Sex preference
West Bengal	Knowledge of AIDS
Delhi	Knowledge of AIDS

National Family Health Survey, 1992-93

Post-Survey Check

Padam Singh

A post-survey check of the survey data using systematic sampling methods confirmed the high quality of the data generated in the NFHS.

Background

THE National Family Health Survey (NFHS) was conducted in 24 states and union territory of Delhi which account for about 99 per cent of Indian population. The ministry of health and family welfare, government of India, designated the International Institute for Population Sciences (IIPS) as the nodal organisation responsible for providing co-ordination and technical guidance for the NFHS. Technical assistance for the NFHS was provided by the East West Centre, Honolulu, Hawaii. The Population Research Centres (PRCs) participated in all phases of survey implementation for the states in which they were located. Consulting organisations (COs) were responsible for facilitating survey activities in one or more states covered by the NFHS. The NFHS covered a sample of more than 90,000 households and about equal number of ever-married women in the age group 13-49. In this survey information was collected relating to socio-demographic characteristics of households, fertility, knowledge and practice of family planning methods, maternal and childhood mortality and related aspects.

After receiving the preliminary reports of the NFHS, the ministry of health and family welfare sponsored a 5 per cent post-survey check of the households already surveyed in the NFHS to be carried out by the Institute for Research in Medical Statistics (IRMS), New Delhi. This post-survey check was conducted in 13 states and UT of Delhi.

II

Methodology of Post-Survey Check

SELECTION FOR RESURVEY

A multi-stage sampling design was used for the selection of the sample for the post-survey check. In the NFHS, villages were the primary sampling units (PSUs) and the households as the secondary sampling units (SSUs). Using the list of villages surveyed in the NFHS a 5 per cent systematic sample of villages was taken. The district to which

a selected village belonged was identified. Two or three additional villages out of those surveyed in the NFHS from this district were also taken to form a cluster of three to four villages per district. In the selected villages every third household out of those surveyed in the NFHS was taken for the resurvey. The use of systematic sampling of villages for resurvey ensured a uniform spread of the sample in the state. Similarly, a systematic sample of households in the selected villages ensured better cross-section of the whole village.

The field work for the post-survey was supervised by senior scientists of IRMS, New Delhi, with assistance from the middle level staff. The training programme for the senior scientists was organised by IIPS, Mumbai. Visits to some of the areas of Mumbai covered in the NFHS were also

undertaken for testing the approach to be followed in the post-survey check. Subsequently, a detailed training programme was organised at IRMS, New Delhi, for the middle level staff of the Institute which included field orientation in the selected areas from Delhi and Haryana.

The post-survey check had two crucial aspects, namely, locating the selected households and canvassing the questionnaire. Great care was taken to see that the household being resurveyed was really one randomly selected as per the NFHS list. It may be mentioned that house listing did not always provide father's name and caste which were crucial in locating an individual in Indian context. The NFHS numbers, although found in some places were not always available since the gap in resurvey and initial survey was more than a year and many of the houses had

been whitewashed during this interval. However, the list of all households for the selected PSUs had the names of the neighbouring households which was of great help in locating the desired households. The field work for the post-survey check was carried out between December 1993 to March 1994.

Both household and women's questionnaires of NFHS were canvassed in the post-survey check. Since the field work of the post-survey check was undertaken more than a year of the NFHS, in the questionnaires only those questions were retained for resurvey for which either there was likely to be no change with time or the change was likely to be only in one direction. The information from the selected households was collected following the same approach as used in the NFHS.

In this study the sample size was 5 per cent of the households in the NFHS sample. The details on sample size are given in Table 1 for both the NFHS and the post-survey check.

ESTIMATION AND CONFIDENCE LEVELS

The estimates of various parameters have been worked out using appropriate estimation procedure. The estimates of various parameters in different situations are subject to their own standard errors because of the variability in the characteristics under study as well as sample size. Further, standard errors would differ from state to state. Although the significance levels have been determined using appropriate formulae, consideration is also given to other important facts relating to non-sampling

errors, while interpreting the differences. For example, for the population related parameters, the difference in the estimates beyond 2 per cent points should be considered as significant. But despite all precautions heaping of age figures in ending 0 and 5 tend to occur as is known for such data from the Census, SRS and also in the NFHS. Hence the difference

of five or more percentage points in the age related parameters was only considered as significant. On the similar analogy the differences of a magnitude more than 6 per cent in the estimates of family planning related parameters by two sources have been considered as significant. Similarly, the difference of more than 15 percentage points in results from the post-

survey check and the NFHS in the immunisation coverage levels have been taken as significant. Further, while commenting on the differences those which have bearing on the quality of NFHS have only been referred.

The results have been obtained at the state level highlighting the magnitude of differences in the parameters which are crucial in interpreting the data of the NFHS

via-a-vis post-survey check. The results from other sources such as Census, SRS, etc, have been quoted as and when considered appropriate. The findings on the crucial parameters are summarised in Tables 2 to 9. The salient findings are discussed in what follows.

The sample of households selected in the post-survey check could be contacted with the list given to IRMS, New Delhi

by consulting organisation. However, in about 5 per cent of cases in rural areas and 25 per cent in urban areas there were cases of non response because either the household has migrated or was not available at the time of visit. In such cases method of substitution was adopted.

The demographic profile of the usual residents in the post-survey check has been studied in terms of selected characteristics such as age, sex, marital status, education, etc. Of these the demographic characteristics of households in terms of distribution by age, sex and marital status were not likely to change in one year. The results on these in the post-survey check were similar to those of the NFHS. The literacy rate for both males and females which was expected to increase with time, the results on the same in the post-survey check, the NFHS and 1991 Census presented a consistent picture.

The total fertility rate (TFR) in the post-survey check has been observed broadly of the same magnitude as in the NFHS except for Rajasthan. The estimates of the number of children ever born presented the same trend as the total fertility rate.

The results on awareness of modern methods of family planning in the post-survey check and NFHS were similar except for the 'injection' method for the states of Uttar Pradesh, Madhya Pradesh, Rajasthan, Gujarat, Haryana and Delhi. In the post-survey check, it was much lower compared to the NFHS. It may be noted that even health personnel were ignorant of the 'injection' method of family planning and it has not been included in the family planning programme. In this connection, it may be mentioned that in the

NFHS respondents were asked to indicate the methods of family planning which they were aware of without any prompting. It appears that in some of the northern states IUD which was also locally known as 'suyi' could have been confused or got mixed up with 'injection' method of family planning. The awareness of traditional methods of family planning has also been reported to be relatively high in the NFHS as compared to the post-survey check.

In the post-survey check as well as the NFHS, the percentage of female sterilisation has been observed broadly of the same magnitude. Further the percentage of eligible couples using any of the modern methods of family planning in the post-survey check as well as in the NFHS was also within acceptable margin of error.

On the antenatal services, and the immunisation of pregnant mothers the results by two sources presented a consistent trend. The results on delivery management by the two sources also presented broadly a consistent pattern.

In the results provided in the NFHS, the immunisation status of children has been given for those who were of 12-23 months at the time of survey. For comparison of the post-survey check and the NFHS, the information for the children born during the comparable period have been utilised. The estimates of immunisation coverage levels in the post-survey check and the

NFHS have been observed at variance in most of the states. For the states of Uttar Pradesh, Madhya Pradesh, Rajasthan, West Bengal and Bihar the coverage levels in the NFHS were significantly lower as

compared to the post-survey check. On the other hand in Gujarat, Karnataka and Haryana, the results for NFHS were lower as compared to post-survey check.

The post-survey check conducted by IRMS, Delhi confirmed the high quality data collected by consulting organisations for NFHS during 1992-93. However, for some of the parameter, differences have been observed and the planning of NFHS II should take note of the same. For example, about the awareness of traditional method of family planning, the instruction manual should be elaborated to ensure the correctness of the response and injection method of family planning may be taken out from the questionnaire. The staff should be thoroughly trained to determine the number of children born during a particular period and the exact age of the child specially in the states with lower female literacy. The method of data collection or immunisation coverage, in particular needs modification by incorporating some of the finer aspects of the questionnaire and approach of data collection as used in the coverage evaluation survey (CES) undertaken by the ministry for the purpose on the households selected by the NFHS.

[The study was funded by ministry of health and family welfare through IIPS, Mumbai. The field work and analysis was undertaken by the scientist and staff of the IRMS, Delhi. The help received from all is gratefully acknowledged.]

What powers
Centurion Bank, as
the bank of the
next century?

Nationwide NETWORK

At Centurion Bank, we believe in a few simple things. As simple as providing services engineered to meet individual customer needs. Adding value to all banking products. Investing in the best of banking technology and people. In the process, bringing the bank closer to our customers through nationwide network. No wonder. Anywhere banking service helped us build lasting relationships.

We have grown on all fronts. Our strategy has always revolved around a relentless commitment to providing superior services using world class technology. And it is this focus that has made Centurion Bank maximise customer satisfaction. And at the same time, its business.

Centurion Bank

State-of-the-heart Banking

CENTURION BANK LIMITED.
